Since the publication of the few remarks on the milling of auriferous veinstones, which I made at our last meeting, numerous questions have been asked me in reference to it, many still wishing to believe that there are such things as *rebellious gold ores*, so that I have again taken up the subject, though it would be impossible to do full justice to it without occupying more time than I have at my disposal.

In the first place, I would suggest to any mine adventurer or superintendent, working lodes, which they think contain *rebellious gold ores*, or mineralized gold, that the best argument they can use would be *facts*, in the shape of ten or fifteen-pound samples of the veinstone, say, in pieces of one or two inches square, representing, of course, quantity. They can forward such samples to this society free of expense (owing to the liberality of Wells, Fargo & Co.), and, when received, I will get a committee appointed to examine and report on them.

To mill men, it is not only of the greatest importance, but one would think absolutely necessary for the success of their operations, to have at least some knowledge of the true condition of the material they are working; otherwise it is all speculation, and can but be compared to groping in the dark with a faint hope of stumbling upon the right treatment.

In the ninety-nine cases out of the hundred you will find, when people talk of having large lodes containing rebellious gold ores, assaying very high, but that by the ordinary mill process they cannot save the gold, that samples selected for assays were not fairly taken, and the real trouble arose from the fact of there being little or no gold in the lode to save.

To those who feel interested on this subject, I would recommend the careful perusal of an old work: "Baron Ingo Born's New Process of Amalgamation, translated into English by R. E. Raspe, 1791." I will merely quote one passage from it in reference to the mineralization of gold. He says:

"Bergman, whose name will be immortal in chemistry, and whose opinion may be taken for that of all the chemists together, sets forth that mineralization requires the presence of a menstruum which, dissolving the metals, deprives them of their form and appearance; and all the other combinations of metals, as likewise the disguises of native metals in different sorts of stone and matrices, are but so many different *mixtures*. From these ideas very naturally arises that common division of metals into native (nativa), disguised, (larvata), and mineralized (mineralizata)."

In a note at the end of the same section, he says: "I use here the name of gold ores without employing the least idea of their mineralization, or calciform state—which, in my opinion, never exists—I mean to express that gold particles, small and invisible, are disguised in them, and wrapt up in other minerals."

Richard Kirwan, in his "Elements of Mineralogy," published in 1796, absolutely denies the mineralization of gold, and says: "Gold being incapable in low heats of uniting with pure air, sulphur, arsenic or any acid furnished by nature, it is plain it can never be mineralized, in the strict sense of the word."

I have quoted from these old authorities to show that the question of gold ores is by no means new. I trust, however, for the future, such terms as "rusty gold" and "rebellious gold ores" will be only found in their proper place, amongst the list of "vulgar errors."

The gold of the Comstock lode is argentiferous, and occurs, more or less, in an unchanged form and composition throughout the whole length of the lode, and from the croppings to the deepest workings. Its diminished value is caused by the silver alloy. It consists—53.37% gold, 42.87 silver, and 1.76 of substances as yet undetermined.

I have just been handed a copy of the Forty-eighth Annual report of the San Juan del Rey Company, Brazil, dated London, June, 1878. It appears that, during the year, they stamped 62,745 tons, and that the mean loss on treatment was 31%. The gold contents of the veinstone, about $21 per ton. The average width of lode, 42 feet; length of stoping ground, 600 feet; stamps, duty heads, 135; working days, 355.44; tons stamped, 62,745; tons per day, 176.53.

In their report of June, 1867, they stamped 60,685 tons, with a loss of only 14.92%. No explanation is given for the great difference in loss, but their streaking or mode of concentration must be defective.

The company might do well to try some of our California concentrators. Mr. J. Hendy's concentrators have been used in this country for a great number of years, and appear to have made very clean work.

In reply to the questions respecting the Catalau process, it is one of the most primitive modes of making iron, and the cost of the furnace, forge and trompe, would not be much more than that required to build and fit up a good blacksmith shop.

If we made our own iron, it would give employment and bread to the many, instead of the enrichment of the few, which appears to be the result of importing it.

MECHANICAL PROGRESS.

The Telemachon.

Since Mr. Edison's wonderful inventions have been brought forward, the country has been seized with a desperate hankering after the wonderful and the popular interest and inventors' hopes run high. So much is said of astonishing matters in the Eastern daily papers, that one hardly knows what to believe and what to laugh at. We read that at Ansonia, Conn., William Wallace is experimenting with a new electrical machine. He calls it the telemachon, and claims that by it, when perfected, power can be transmitted hundreds of miles through an ordinary cable. For instance, a steam engine in Scranton, Pa., could be connected by a cable with a factory in New York and the latter be run for the cost of the cable and the greatly decreased cost of coal in Scranton. With this new invention working as it is claimed it will, the cities near the coal mines would become vast centers of power filled with engines sufficient to run all the factories of the Middle States at one-half the present cost of fuel. Mills would be filled with whirring spindles and rattling looms hundreds of miles away from the engines that run them. Only a small wire cable entering a building would show the source, though hardly the philosophy, of the transmitted force. The possibilities of the invention go further. The cable can be tapped like a telegraph wire, so that one continuous cable can do the whole work of the country, provided there is power enough at the starting point.

These are the possibilities of the telemachon as developed by Wallace. But Edison has been down to Ansonia and discovered still greater possibilities. He is confident that not only can power be transmitted by the telemachon, but that light and heat can be created by it. This would do away with the use of coal almost entirely. Great mills could be run by Niagara through the instrumentality of the telemachon, and lighted and heated by the instrument itself. The displacing of manual labor by the one would thus be more than made good by the decrease in the cost of living brought about by the other. In other words, the problem of physical life and action would be solved, and the world would make a stride of countless centuries towards the millenium.

An English Ore Crusher.—We read in the *Mining Journal* a short description of improvements in ore and mineral crushing machinery, introduced by T. H. Trogoning. The machine is driven by steam, water, or horse power, and substantially consists of two circular plates of unequal sizes, so fixed as to work out of center of each other, and making an eccentric motion. These plates are the grinding or crushing gear of the machine, and are kept at the required distance from each other and pressure on each other by the adjustment of a weight on a registering lever. The machine is fed by casting the material to be crushed into a receiving hopper, whence it passes into a hollow cylinder above the upper plate by an aperture. After being ground the eccentric motion of the plates forces the material into a gutter or "launder," whence it is removed in any direction by water or other means. At the end of the registering lever there is a reversible socket, with, say, four indentations, for the purpose of receiving the spindle, in connection with bottom crushing plate. The motion is communicated to the upper plate of the crusher by means of shaft and driving wheels, whilst the pressure is regulated by the forcing up or letting down the lower plate by means of the registering lever. Great claims are made for this machine in speed and amount of work done.

A Gain for the Bobtail Cars.—The New York *Tribune* says: The one-horse cars, known as "bobtails," are gradually taking the places of the old two-horse care on the surface roads. Soon after the opening of the Metropolitan Elevated railway, the Sixth Avenue Railroad Company began to put one-horse cars on its Canal street branch. These cars have now entirely superseded the two-horse cars on that part of the line. The change of cars on the Canal street branch has resulted in a decided gain to the company. For 16 two-horse cars 25 one-horse cars, without conductors, were substituted. It has been found that each of the smaller cars yields as much money as did any of the larger cars, and the company has been able to dispense with the services of 10 men and the same number of horses.

An English Magnetic Engine.—The operation of the machine invented by Mr. George Andrews, of London, depends on the property of attraction and repulsion of the negative and positive poles of permanent magnets respectively, the independent force counteracting the gravitation exercised by the weights employed to keep the revolving magnets turning, at the same time overcoming the friction to which every machine is necessarily liable; this force, therefore, has the effect of keeping the weights always wound up, and as the permanent magnets rather increase from use in power the machine will be self-sustaining as long as the material keeps in good order. By combining any number of magnets any required power might be achieved.

A New Metal.—The manufacture of a new metal, composed partly of steel and partly of iron, has been described in Paris. *Iron* says: The novelty of this new combination consists in the introduction of a thin sheet of iron between the surfaces to be welded. A cast-iron mold is divided into two departments by means of a transverse plate, or of a tube placed in the interior, and the two metals are poured into the respective compartments. Before fusion, both metals are submitted to complete refining, which removes all matters that hinder welding; they are then turned into the mold, the sheet-iron partition in which serves to prevent their mingling, and to facilitate welding by being itself brought into a state of fusion. The success of the operation depends considerably on the preparation of the metals, on their readiness to weld, and on the thickness of the partition. The last is determined by experiment, and the dimensions differ according to those of the ingots to be produced. The metal thus prepared is said to be adapted to the fabrication of rails, anchors, etc., where the hardness of the metal diminishes the wear, and increases the resistance of the masses. In the construction of safes, plates of this combination are said to be proof against all attempts to break or drill through them.

A Suggestion for Machine Shop Builders.—Locating machinery in shops is a matter which those in charge of the design and erection of the machine shops have in most cases found difficult to effect to the best advantage. With a complete plan of the buildings and a knowledge of the machines to be used it is difficult to locate machines to the best advantage at the first, or even after many trials. It nearly always happens after the position of some of them is laid down on the plan, changes suggest themselves which make it necessary to rub out all that have been drawn in and an entirely new start must be made. It is therefore always best, says the *Railroad Gazette*, to have plans of the different machines drawn on thin card-board, to the same scale as that of the buildings, and then cut the plans out and paste them on the plan of the building. They can then be shifted around in any desired position, until a satisfactory arrangement is obtained, and then be permanently drawn on the plan. Very much the best way, however, is to do this before the building is erected, as it usually happens that some changes in the plan of the buildings themselves is suggested in arranging the machinery.

Submarine Electric Light.—For the purpose of submarine lighting, Messrs. Barnet and Foster compress pure oxygen into a cylindrical reservoir of the plate iron, under a pressure of thirty atmospheres. This oxygen is supplied by a flexible tube to an alcohol lamp provided with means for the escape of the gaseous products of combustion. This furnishes a brilliant light for a period of four hours. Heinke and Davis use a glass cylinder upon the diver's helmet, which contains an electric lamp of polished copper. The carbons are arranged to last four hours without being renewed. The whole apparatus weighs about 27 kilogrammes, and is capable of furnishing a light equivalent to 20,000 standard candles.

The Screw Propeller.—A gold medal, value £25, has been offered by Mr. R. Carlyle for the best paper submitted to be read at the annual general meetings of the English Institution of Naval Architects in 1879, "On the construction of the screw propeller, its form, number of blades, pitch in proportion to diameter, etc., so as to give the smallest amount of slip with the greatest amount of propulsion for a ton of coal." All papers to be delivered on or before February 24th, 1879. No paper arriving after that date will be eligible to compete for the gold medal.

Steam Road Wagon.—O. A. Olmstead exhibited to us this week, says the *Sutter Banner*, the model of a steam road wagon and cultivator, his own invention, which appeared to us to be the very best thing for the work for which it is intended. The inventor, who is comparatively a poor man, is in search of some capitalist who will invest money in the machine. It appears to us that there is a fortune in the machine, and we have no doubt the man needed will be found. The model can be seen at the Half Way house, Marysville.

A European Railroad Turn-table.—We read that a model turn-table in the Austro-Hungarian department of the Paris exposition has a neat contrivance concerning the balls on which it rolls. Instead of having the lower circular trough entirely full of balls touching one another, and thus grinding and destroying one another, there is a light ring frame containing equidistant holes, in which the balls sit loosely, thus requiring fewer balls and moving more easily.

An American Locomotive's Tour Through Europe.—The specimen locomotive sent to the Paris expositiou by the Philadelphia and Reading Railroad Company is to be taken over the railroads of Italy and other countries, and an engineer has been delegated by the company to proceed abroad to take charge of the engine during its travels.

SCIENTIFIC PROGRESS.

Investigation into the Food Supplies of Trout.

The tenth annual report of the New York Fish Commissioners contains some valuable scientific investigations into the food supplies of trout. It appears from an abstract of the report which we read in the Utica *Herald*, that the Fish Commissioners authorized Profs. Lintner and Peck, the State entomologist and the State botanist, to make a thorough examination of the insects and plants growing in Caledonia creek, where the State hatching houses are located, and make a full report of the results. This creek has long been noted for the astonishing number of trout which have been taken from it, apparently without diminishing them as is usually the case in ordinary streams. It was found upon examination that the fauna and flora of this creek were also unusually abundant. The species of plants were not many in number, being only a water-cress, a chara and four mosses. But the quantity of each of these is large, and one of them, a rare moss, *Hypnum noterophilum*, or moisture-loving moss, which has not been found elsewhere in the State, and is known in only one or two other States of the Union, grows here in great profusion. Trout-food in the shape of animal life which inhabits the plants and the bottom of the creek, was found to be wonderfully abundant. A single bunch of moss brought up by the rake contained representatives of three classes of the animal kingdom, vertebrates, articulates and molluscs; and their number was so great as to astonish Prof. Lintner, who in all his experience had seen nothing equal to this. Such a revelation as this naturally suggested that there must be a relation between the great number of trout and the great quantity of trout-food existing in the creek. And, of course, if the plants and insects are to be furnished along with the fish for stocking streams, they must be raised and cultivated also. No difficulty is anticipated in doing this, except that each species of insect, or crustaceans or molluscs, must be kept by itself for breeding; and the two professors are now engaged in making experiments in this direction, which are expected soon to have practical results. Some streams are already furnished by nature with all that is necessary for the support of the fish. Others are barren, and can only be successfully stocked with fish by stocking also with food. Artificial ponds are often constructed, and these also will need to be planted with mosses and insects before stocking with fish. In case salmon, bass, or other species of fish are desired for certain localities, the appropriate food for each kind will be sent along with the young fish.

A Controversy About Mosandrum.

We lately mentioned the claimed discovery, by Dr. J. Lawrence Smith, of Kentucky, of a new metal to be called "mosandrum." It seems that the French chemists deny the claim. M. Marignac, after a careful examination of specimens containing the supposed new metal sent him by Dr. Smith, pronounces them to contain nothing but terbium. He (Marignac) nevertheless announces as his belief that the spectroscopic studies of M. Soret have demonstrated the existence in the mineral gadalinite (from which Dr. Smith's mosandrum was obtained), of a metal which appears to be new to science. He does not believe, however, that this is the mosandrum of Smith, but rather that it is the radical of an earth isolated by M. Delafontaine.

The *Polytechnic Review* anticipates a long controversy to settle this point, because but little is known at best of the rare metals accompanying the alleged mosandrum, and the methods of effecting their separation are consequently imperfect and uncertain. Indeed, says the *Polytechnic*, unless we are greatly mistaken, the name of the very metal terbium, with which Marignac affirms the mosandrum of Dr. Smith to be identical, upon many of the elementary charts of the chemical lecture-room is decorated with the appendage known as an interrogation mark, from which it will appear that Marignac's objection to the existence of mosandrum may after all be easily disposed of. We shall doubtless soon hear from Dr. Smith on the subject.

Notes on the Interior Rivers.—The Stockton *Independent* prints a letter from a member of the party engaged in surveying the proposed Sacramento drainage and relief canal, under Col. Isaac W. Smith, for which survey the last legislature appropriated $10,000, gives some interesting information. He says: "I did not know till I made the circuit of this survey that the great streams and smaller water courses draining the eastern water shed of the Coast range from Knight's Landing to Rio Vista, do not cut for themselves channels to the river. I knew the river like all our streams is on the highest ground, transversely, of the valley, and that such streams as Cache and Putah creeks sink to some extent, but I supposed, still, that they cut their channels and emptied at a high state of water, directly into the river. Such I find not to be the case. The "rim-land" of the river from Knight's Landing, where it is 1,500 feet wide to the mouth of Cache slough, three miles above Rio Vista, where it is only 100 wide, serves as a dam, and turns all this water, after flooding the great tule area, into the river via Cache slough. There is a well-defined ridge running from the Coast range to the river, at Knight's Landing, and these Montezuma hills from the Coast range, reach the river at this point, Rio Vista. The line of this proposed canal may be represented by a line from near Knight's Landing, following about the line of high water, or rather a little above the line of tule, and cutting this Montezuma ridge northeast of Denverton, a few miles, or eight or 10 miles southeast of Fairfield, say to Montezuma slough, Suisun bay. If the work is a success, it will accomplish a grand result. Thousands of acres of fine land will be reclaimed, and damage prevented to thousands more already reclaimed on the other side of the river."

The Sinking of New York Island.—Prof. Newberry in the October *Popular Science Monthly* revives the facts about the gradual sinking of Manhattan island and the adjacent territory. He says: A number of facts indicate that the coast of New Jersey and Long island is gradually sinking. From the marshes of New Jersey are taken the trunks of trees which could not have grown there except when it was drier ground, and on the shore stumps are seen, now under water, of trees which must have grown on land. So, too, the sea throws up in storms portions of turfy soil, once covered only by the air, and similar soil has been reached below the sea-level in pits dug through drifted sand along its margin. It is also said that the land boundaries have been changed and farms diminished even where the wash of the shore-waves produced no effect. The rate of this subsidence is very slow—only a few inches in a century—and it may at any time be arrested or reversed; but, should it continue, as it may, for some thousands of years, it would result in a submergence of land now valued at hundreds of millions of dollars, and a complete change of position in the seats of commerce and industry, which must always center about this harbor. This possible catastrophe is, however, so uncertain and remote that it seems hardly sufficient to disturb the equanimity of at least this generation of inhabitants.

A Claimed Discovery in Sugar Crystallization.—It is announced in the daily papers by telegraph from Washington that crystallized sugar has been obtained from cornstalks and sorghum. The following is the announcement: Dr. Collier, the chemist of the Department of Agriculture, has, for the past two weeks, been experimenting on a large scale in the manufacture of crystallized sugar from cornstalks and sorghum. The aggregate weight of cornstalks used was 11,237 pounds, and the weight of sorghum, 13,958 pounds. The weight of the juice from the cornstalks was 2,773 pounds, and from the sorghum, 4,963 pounds. The specific gravity of cornstalk juice was 1054; that of sorghum juice, 1058. The percentage of juice in the cornstalks, as they came from the field, was 24.68; percentage in sorghum, 35.56; 2,571 pounds of cornstalk juice yielded 382 pounds of syrup, and 4,355 pounds of sorghum yielded 660 pounds of syrup. This syrup contains 75% of its weight of sugar. The mill used in these experiments was an indifferent one, and the sorghum was in small stalks. Better results would have been reached had the stalks been larger. Dr. Collier says he is satisfied that there is not a farmer in the country but what can rely upon results 50% greater than he has secured, with a better mill. In these cases he got a good crystallized sugar.

A New Manganese Battery.—This element consists of a cylinder of compounded and porous carbon, pierced with holes parallel to its long axis, which serves as a porous cup and collecting plate, and this, with a rod of zinc, is enclosed in a glass vessel. In the cavities in the cylinder is placed binoxide of manganese, and the outer vessel is filled with water containing about 20% of chloride of zinc as free from lead and as neutral as possible. This couple may be recharged without recourse to the maker; and with it there is not formed the double chloride of zinc and ammonium that under certain circumstances incrusts the porous cups. The avidity with which chloride of zinc takes up water prevents evaporation and the cessation of the current by the drying up of the exciting fluid of the battery.

Heat Conductivity. — Experiments lately made by M. Schuhmeister on the heat conductivity of cotton, wool and silk, by a method similar to that employed by Stefan for determining the conducting power of gases, have led to the following results: The heat conduction of air being considered = 1, that of cotton is (on the average) = 37, sheep's wool = 12, and silk = 11; the cotton and the wool were unwrought. The latter was washed merino wool; the silk was in the state of cocoon fibers.

Solar Observations.—Says Mr. Lockyer in the *Nineteenth Century*: "Changes under one second of angular magnitude in the center of the sun's disk can now be faithfully recorded and watched from hour to hour; in other words, changes in cloud regions ten miles square in a body 92,000,000 miles away can now be chronicled."

Mining Share Market.

The *Bulletin* of Oct. 16tb says: "The indifference noted in the Mining share market last week is hearing its legitimate fruit this week. Investora being tolerably well filled with stock, the search for huyers has commenced." The result is inevitahly a downward tendency in everything, and it is to he ascribed not to news from the mines hut to the market alone. Since Thnrsday last there has heen a drop in nearly all the Comstocks. Utah rose $2 on Friday, hnt has since declined to $25. Sierra Nevada was $222 on last Thursday. Yesterday its hest price was $160. Union Con. has fallen $40 in the same time; Mexican, $25; Ophir, $15; even the honanzas show a slight fall. These last did not pay dividends last month, hut we helieve measures have heen taken to assure them on next "payday." Eureka Con. has remained steady, as it usually does. Bodie has heen to $18½, showing on the whole a slight downward movement, which prohahly need excite no attention. As a general thing the week in the market has been exceedingly dull and uninteresting.

POISONED, NOT DROWNED.—The London *Whitehall Review* considers that the fearful mortality, succeeding the sinking of the excuraion steamer *Princess Alice* hy the *Bywell Castle*, was due to the hefonled and poisonous condition of the water of the Thames. Near the scene of the disaster a colossal stream of fermenting London sewerage, "hlack as Erebus, effervescent with the vilest gases and potent as prussic acid," poured into the river. It was into water saturated with such compound that the unfortunate passengers were suddenly plunged. Many who could swim did not succeed in aaving themselves. Colored dresses were discolored in half an hour. Healthy bodies decomposed almost immediately. Does not this indicate something more than drowning?

AT Kaeping, China, a flat piece of country about twenty miles long, is covered with coal and iron stone. The coal is bituminous, having from 70% to 75% of gas, and from 7½% to 15% of ash. It has every appearance of heing excellent.

THE Bank of England has raised the price of the Eagle one farthing, and Napoleons one penny. This action is caused by the influx of one million pounda aterling in gold Oct. 7th.

A NEW 20-foot ledge is reported from Deadwood, Black Hills.

MINING SUMMARY.

The following is mostly condensed from journals published in the Interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MARBLE DISCOVERY.—*Dispatch*, Oct. 12: Mr. H. L. Joy, discovered, recently, an extensive quarry of excellent marble, on the ranch of Mr. Hector Donley, about half a mile from Slabtown. Mr. Joy has had much experience in marhle, and he thinks his discovery presents a superior quality, and a very large quantity. Amador county has several other marhle mines, which are destined at some futuro day to prove very valuahle. We do not see why the establishment of large marble works somewhere in this county would not be a profitable undertaking at this time. Such an industry would have all the material, and a spleudid and varied quality, right at its door, the cost of which would be hut little above the simple expense of taking it from the quarry. This is a matter that is at least worth inquiring into. The marble deposits of this county are entirely too valuable to be allowed to remain much longer comparatively untouched.

MISCELLANEOUS.—*Ledger*, Oct. 12: The Downs mine has struck a pocket estimated to yield $200 per ton. Carpenters are husy at work erecting a substantial huilding over the shaft of the Moore mine. The Grass Valley fluming operations near Volcano are heing prosecnted with energy. Rich gold-hearing gravel has been cut in the excavations, some spots yielding as high as a dollar to the pan. The Californuia mine, in Drytown district, was sold at sheriff's sale, on September 28th, to Knight & Co., of Sutter Creek, for $892.48, amount of judgment and costs. The Loyal Lead mine was also sold hy the sheriff on September 28th, to Geo. Allen, of Bntte Creek, for the sum of $3,493, amount of judgment and costs. The great tunnel undertaking at Volcano ia in a distance of 1,200 feet, with 1,000 feet more to run. The Montirichard made a flattering clean-up this week. The Modoc mine, beyond Volcano, is to rcsume work forthwith. J. McNamara, of Jackson, is going up to take charge.

CALAVERAS.

GRAVEL MINES.—*Chronicle*, Oct. 12: There has heen a slight increase of the volume of water in the ditch since cool uights became chronic—enough to permit of the running of three or four gravel mills in this vicinity. The mill at Duryea mine started up Tnesday and will prohahly continue steadily in operation in the future. The Rough Diamond mine is also being vigorously worked and the mill is running day and night. Indications are favorahle that the water supply will permit of nninterrupted operations. Several hundred carloads of gravel have heen pnt under the stamps of the Hoey & Sliter mill, lately, and work in the mine is going steadily forward. There is no water yet for hydraulic operations.

CRUSHING.—Garland's mill at Mosquito is now running on rock from the San Joaquiu mine, owned hy J. J. Holmes, Esq. The rock is so rich that a large portion of it had to he sacked to prevent loss.

EL DORADO.

RICH GRAVEL.—*Mountain Democrat*, Oct. 12: At Rohinson'a mine, Prospect Flat, a hed of gravel has heen struck which prospects from 20 cents to $1.00 a pan, and it has every appearance of heing an entirely new hench, as extensive as it is rich.

KELSEY.—The interest in mines and mining in this part of the county seems to he increasing every day. The success of the Gold Deposit so far, and the consequent activity in and about the mine, has infused new life into the miners, and the result is that they are searching the hills and ravines for more just such mines. I saw several prospectors yesterday, and althongh they had not made any great strike, they showed me some good prospects from aeveral locations. One specimen of ore resemhled the Gold Deposit, and prohahly was from that lode, although it was ohtained two miles from the present site of that mine. Other specimens, but of different character, were equally rich, and I have no douht it will lead to developments that will hring into view several more mines in this immediate neighhorhood.

LOS ANGELES.

TEMESCAL TIN.—S. F. *Bulletin*, Oct. 9: A correspondent writes: I never was more disappointed than in my visit to the great tin mines. While there is every evidence of tin in great ahnndance, there is no work going on, nor does there seem to have heen for many a day. The tunnels and shafts are all full of water, and everything looks quite as dilapidated as Rip VanWinkle's old gun. I have understood, however, that the mines have been bonded to a English company for $1,000,000, and that work will begin soon.

SANTIAGO CITY.—S. F. *Bulletin*, Oct. 9: A correspondent writes: The city is laid out some five miles from Silverado, and if the ores in Shrewshury canyon and vicinity prove as good as many expect for them, this new town will he quite a center for milling purposes, etc. The Santiago canyon is about 25 miles long and shows as many different formations as any one locality. Near the mouth, on the seaward side, I ohserved a red sandstone formation, a aingle stratum 100 feet in thickness, and on tbe opposite side, only a little above, I noticed a white sandstone formation, evidently a marine deposit, about 50 feet in thickness, underlaid hy a bituminous coal stratum over three feet in depth, which is supported by a thick slate stratum underneath. Below this some 30 feet is a five-foot stratum of kennel coal. Five miles further up the canyon the formation hegins to change. Here I found traces of slate and soapstone, also a stratum of bituminous coal two feet thick, showing considerahle sulphurets. Above this, porphyry sets in with an occasional show of limestone. Silicate and mica are also represented. In the vicinity of the mines the canyon divides into almost innumerable smaller canyons, and the mountains become very rugged indeed. In some cases the walls are precipitous, showing immense ledges or reefs of granite porphyry and carbonate-stained shale, with an occasional show of slate. In the Silverado canyon I saw a ledge of ore that purports to have assayed tin to the value of above $200 per ton. One assay gave 33% of tin. This ledge shows well, and from all appearances bids fair to take the lead as a tin mine.

TIN AT SILVERADO.—Anaheim *Gazette:* The latest sensation at the Santa Rosa mining district is caused by the establishment of the fact that there exists a large and valuable deposit of tin ore near the town of Silverado. The first discovery was made about two months ago, and was followed hy a general stampede in search of tin. Several claims were located hut the excitement soon subsided as the difficulty in testing the ore failed to fix the character and value of the metal with certainty. Meanwhile, interested parties have procured a chemical analysis of the rock, and several tests have been made hy different assayers, giving as the result over 30% of tin, or a value of ahout $160 per ton. At the discovery point on the George Washingtou mine the ledge is hroad and well defined, carrying several veins of a foot and over in width of mineral. It is from this mine that the tests have heen made. Mr. R. B. Campbell is the discoverer of another ledge bearing mineral of the same appearance, which has not yet been tested. The ore is identical in character with the ore from the renowned Temescal tin mine, and it is thought to heloug to the same helt.

SILVERADO.—Santa Ana *Times:* The prospecting fever is in great measure over, and claims are heginning to he opened. Taylor & Co. are at present sacking ore that is richer than any ever before shipped from this district. The pay streak is 14 inches thick. Mr. Lake is trying to let a contract to run an incline of 50 feet on his ledge, his business at Santa Ana demanding all his time. Dr. Harding, of Anaheim, has contracted to run 100 feet on the Wildcat, second extension north on the Southern Slope. The Emma company have shown some good galena, and they intend pushing work in the future. T. H. Lyncb & Co. have just finished a trail two miles in length from Shrewshury's canyon to their mine. They will commence taking out ore immediately. Work is heing doue on the Santa Rosa, Southern Belle, Victoria, Southern Slope, Gold Hill, Emma, Florentine, Blue Light, Warwick, and many others.

MONO.

BODIE.—*Standard*, Oct. 9: The greatest enthusiasm is heing displayed hy all owners of mines and locators, and the proof of the earnest desire of such to develop their various properties is given in the fact that hut few men are seen lounging around the streets during working hours. The principal feature of the week, so far as reported, is the fine hody of ore disclosed and heing extracted from the mines of the Con. Pacific Co. Various assays and experiments with the "horn" shows high grades of gold-hearing quartz, which is found in ahnndance. A vein varying from the size of a razor-hlade to 3 feet in width has heen encountered in the drift now heing run, and hut a few days only are required to establish the fact of a real, live honanza, and such a one as will make even that found in the Bodie pale into insignificance. A moat remarkable discovery was made a few days ago on the flat, near the Booker mine. While prospecting a miner broke off a piece of rock from a houlder standing up in the valley, and, with an idea that it hore a mineral appearance, had it assayed. The result was $111 in silver, with no trace of gold. What or where it may lead to is, of course, a mere matter of conjecture, hut dozens of locations have been made on the adjacent slopes, and a scene of activity prevails in the vicinity. The leading mines, such as Bodie, Bulwer, Standard, South Bulwer, Con. Pacific, Mono, etc., are all looking well, and work going on with energy and success. Many mining experts are constantly arriving, and, as yet, we have to hear the first doubtful opinion given as to the stability of our properties here. The town on the hill, consisting of hoisting works, hoarding houses and dwellings of superintendents and miners is constantly growing, and bids fair soon to rival its more pretentious neighhor, Bodie, in point of numbers.

BODIE MINE.—There is no important change to report, although the indications throughout are more favorable, and show an improvement. In the Bruce winze the ledge is widening, and the ore is very rich. The Bruce stopes continue to yield good ore. The new shaft is down 120 feet, and hereafter more rapid progress will be made in sinking. The bottom is in ledge-matter and looks well, and indicates that it will develop into pay ore in further sinking.

STANDARD.—In the north drift, 300-foot level, the ledge is 2½ feet wide, of good ore. A very good ledge has been cut in the west crosscut, 450-foot level. The stopes continue to look well.

EXCELSIOR.—This mine is located north and adjoining the Richer, and was formerly named the Gold Fish. Work will be commenced hy sinking the main shaft, which is now down 70 feet. Ore has been extracted from the old workings which will work as high as $60 or $70 per ton, and great expectations are indulged in of the future of this mine.

BODIE TUNNEL.—In over 500 feet. Two small quartz veins have heen cut while running the last 30 feet, and the face of the tunnel is now in a very favorable formatiou, indicating the near presence of an ore body.

ORIENT.—A depth of 80 feet has been reached in the shaft. In going down two veins were encountered at 40 and 60 feet respectively, one heing 18 inches, the other two feet wide, from which good assays were obtained.

SIGOURNEY.—The tuunel has developed a strong vein principally silver-bearing ore, average assays from which were $80 per ton for 400 feet. Work has now been discontinued in the tunnel, and a shaft will at once be commenced.

OTHER MINES.—The Mono is occupied in preparing machinery. The superintendent thinks the ledge is not far from the present workings. The Washhurn, on the east slope of Bunker hill, has a four foot and increasing vein. Indications are that the Black Fox will strike ledge within 10 feet. The California shaft is down 135 feet, following the vein. No particular change in the Red Cloud Con. Prospects encouraging.

NEVADA.

KNIGHT OF MALTA.—Grass Valley *Union*, Oct. 10: This quartz claim has been honded to Grass Valley parties, for 12 months, who are now runniug a drift on the ledge at the depth of 50 feet, for the purpose of reachiug a point that will be considered hest for sinking a new shaft. The ledge in places is four feet in width, shows well in free gold, and carries an ahundance of sulphurets. The ledge is on the same system of east and west veins as the Idaho and Eureka, and the quartz and country rock look the same.

NEW YORK HILL.—Grass Valley *Union:* At a crushing of quartz from the New York Hill mine just cleaued up at the Omaha mill, there were 51 loads or about 100 tons, and the product was $10,000, or ahout $100 per ton. This does not include the sulphurets which are very rich, as shown hy all the lots that have passed through the chlorination works. Five tons of sulphurets from the crushing made previous to the present one, gave a returu a few days ago of $350 per ton, or $1,750. The rock just crushed was not estimated at over $50 per ton, as it showed but little in free gold and had nothing of a specimen character, but it is evident from the result that it was rich in very fine gold which was geuerally dissemminated through the quartz. The mine continues to produce the same quality of rock.

PLACER.

LARGE RESERVOIR.—*Argus*, Oct. 12: The Blue Tent M. Co., the head of whose ditch on the South Yuha, is nearly opposite Emigrant Gap, have taken preliminary steps toward constructing an immeuse reservoir, one of the largest in the State, in Summit valley. The company have ohtainecl title to the grouud hy purchase. The hight of the dam is to he 35 feet, and its capacity is estimated at 2,000 millions of gallons, equivalent to ahout 2,000,000 10-hour inches of water. Mr. E. A. Smith, civil engineer, of Placerville, has just completed the survey.

SHASTA.

COPPER CITY.—Reading *Independent*, Oct. 10: The shipment from the Extra mill now averages ahout $1,100 in gold and silver hullion per day, and plenty of good ore in sight to hack up these shipments for the next year without sinking a foot deeper in the ledge than they are at present, as there seems to he good ore in this mine wherever they cut the ledge, and if we have no very severe storms, this company will add to the bullion product of Shasta this month ahove $30,000, which is from only four pans. The Potter mine is improving, showing the same good quality of ore as they sink on the ledge. There is no waste, no assorting of ore necessary, and everything from the foot to the hanging walls goes through the mill, yielding a handsome profit. The Jennie June mine is second to none in this camp. Mr. Sallee says his entire dump from this mine will assay $40 per ton, and it is mostly gold and of a free milling quality of ore, which adds greatly to its value, as it can he milled much cheaper than the majority of the ore of this district. The Northern Light is still producing the same character of rich ore, which seems to be as plentiful as ever. The things most needed in this district are half a dozen more good quartz mills, as there is plenty of rich ore in sight in the Jennie June and Northern Light to keep them constantly running, to say uothing of the Winthrop, which could furnish ore enough alone to run 50 stamps.

MISCELLANEOUS.—The report from all outside prospects is very flattering. The Norton Bros. have a very good prospect situated hetween Copper City and Pit river. W. B. Crane, Superintendent of the Extra, has more machinery on the road for reducing ores, which will he placed in operation in a few days.

SIERRA.

DOWNIEVILLE FOUNDRY.—*Mountain Messen-*

A Curious Edible Fungus.

Our engravings on this page represent two specimens of a curious edible fungus found in different parts of the United States, and known popularly as "Tuckahoe" or "Indian Head," and botanically as *Lycoperdon solidum.* It belongs to the same genus as the "puff-balls," but instead of growing above ground as puff-balls, it is subterranean and is found attached to the roots of large trees, upon which it is parasitic. As seen in Fig. I, a piece of the root is often found enclosed in the mass of the fungus. The form in which this *Lycoperdon* is commonly found is roundish and about the size of a man's head, and it is frequently used as food by the Indians. From these two circumstances is derived the common name "Indian head." Indian bread would not be inappropriate, for when the fungus is broken open, it has the appearance of dried dough, being full of cavities and very granular in its structure. The outside surface of the fungus is rough, filled with cracks and of a dark, ashy black color; inside, its color is whitish and starchy. Chemical analysis shows the composition of the fungus to be nitrogenous matter, 4.06; mineral substances, 1.61; starch, 81.80; water, 12.50. It is pronounced highly nutritious.

This "Tuckahoe" is one of the most famous of the edible fungi and has long been known for its good qualities. According to Dr. John Torrey, it was first brought to the notice of the public by Dr. Clayton, who sent it to Gronovius, under the name of *Lycoperdon solidum,* and as such described it in the Flora Virginica about one hundred and twenty years ago. Next it was described by the late Dr. Von Schweinitz, in his "Synopsis of the Fungi of North Carolina," under the name of *Scleroticum cocos.* About the same time, Dr. Macbride, of Charleston, South Carolina, sent to the Linnæan Society of London his observations on that fungus. Without being aware of having been anticipated by Schweinitz, Dr. Torrey described it in the New York *Repository* about the year 1819, under the name of *Sclerotium giganteum.* He gave also a chemical analysis of it, showing that it is chiefly composed of a singular substance named sclerotine. Braconnot, some years after this, described the same principle, which he called pectine. In the *Synopsis Fungorum* of Fries the fungus is called *Pachyma cocos.* In the Proceedings of the Linnæan Society of London is an account by Rev. E. J. Berkely of a large subterranean fungus that is sold as food in the streets of Shanghai, undoubtedly the same as the Tuckahoe.

New Incorporations.

The following companies have filed certificates of incorporation:

CAMERON G. & S. M. Co.—Capital, $5,000,000. Directors—Cameron H. Kinney, D. A. Macdonald, Peter Amivaux, George Beveridge and Pierce Dorgan.

HIGHLAND M. Co. — Whitewood district, Dakota T. Capital, $2,000,000. Directors—J. B. Haggin, George Hearst, Wm. Willis, Joseph Clark, A. E. Head.

BLACK HILLS C. & W. Co.—To acquire water rights and supply water to towns and cities in Dakota T. Capital, $1,000,000. Directors—J. B. Haggin, George Hearst, William Willis, Joseph Clark, A. E. Head.

DEADWOOD M. Co. — Whitewood district, Dakota T. Directors—J. B. Haggin, George Hearst, Wm. Willis, J. Clark, A. E. Head.

RED JACKET CON. M. Co.—Devil's Gate district. Directors—D. L. Thomas, John Crockett, Philip Henkle, H. O. Reinhardt and A. D. Snedeker. Capital, $10,000,000.

SULTAN HILL M. Co.—Mono county. Capital, $10,000,000. Directors—Sumner D. Prescott, Joseph Wasson, E. C. Locke, T. E. Jewell and Clinton Gurnee.

BROWN MONSTER M. Co.—Mono county. Capital, $5,000,000. Directors, George S. Ladd, F. W. Eaton, Andrew White, W. P. Willard, C. R. Greathouse.

AZURE KING M. Co.—Arizona and elsewhere. Capital, $10,000,000. Directors—B. B. Minor, J. C. Alvarado, A. G. Hawes, W. E. Hate, H. De Veuve.

BLUE BELL C. M. Co. — Railroad district, Nevada. Capital, $1,000,000. Directors—E. Reilly, J. J. Bacon, Ira P. Rankin, M. P. Freeman and George W. Barbier.

ALBERT MICHELSON, a graduate of the San Francisco Boys' High School, and of the Annapolis Naval Academy, recently read a paper on "Experimental Determination of the Velocity of Light," at a meeting of the American Science Association at St. Louis. The paper was much commended, and A. G. Hemingway, of New York, at once gave $2,000 to enable Mr. Michelson to carry out his experiments.

A SMALL flow of hot water has been struck in the face of the east drift on the 1550 level of the Alta. The temperature of the water is 105°. The hottest water found in any of the levels above had a temperature of only 90 to 95°.

THE Neal mine, Indian district, Mono Co., is bonded to San Francisco men for $25,000

A PATENT dredging machine is to be tried in river-bed mining in Montana.

The Atlantic and Pacific Forests.—No. 7.

[By PROF. ASA GRAY.]

Now, a very considerable number of species of herbs and shrubs, and a few trees, of the temperate zone are found all round the northern hemisphere; many others are found part way round, some in Europe and Eastern Asia; some in Europe and our Atlantic States; many, as I have said, in the Atlantic States and Eastern Asia; fewer, which is curious, common to Pacific States and Eastern Asia, nearer though these countries be.

We may set it down as useless to try to account for this distribution by causes now in operation and opportunities now afforded, *i. e.,* for distribution across oceans by winds and currents, and birds. These means play their part in dispersion from place to place, by step after step, but not from continent to continent, except for few things and in a subordinate way.

Fortunately we are not obliged to have recourse to overstrained suppositions of what might possibly have occurred now and then, in the lapse of time, by the chance conveyance of

Fig. 1

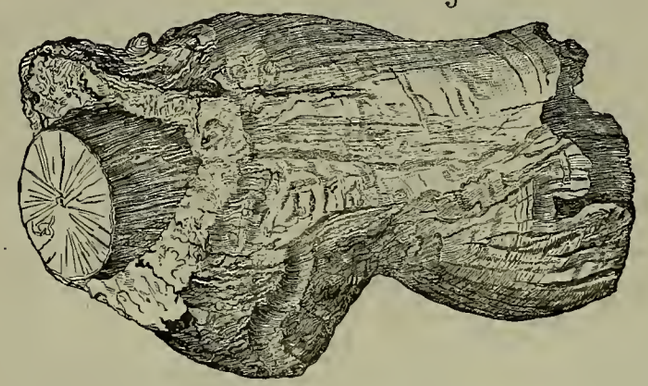

Fig. 2

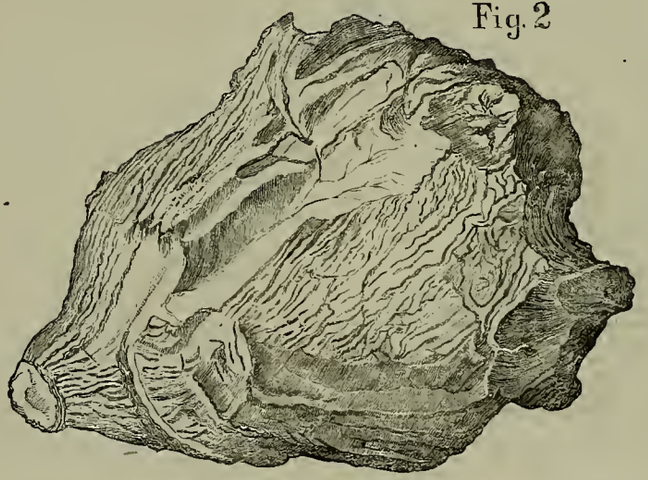

TUCKAHOE OR INDIAN HEAD.—Lycoperdon Solidum.

seeds across oceans, or even from one mountain to another. The plants of the top of the White mountains and of Labrador are mainly the same; but we need not suppose that it is so because birds have carried seeds from the one to the other.

I take it that the true explanation of the whole problem comes from a just general view, and not through piecemeal suppositions of chances. And I am clear that it is to be found by looking to the north, to the state of things at the arctic zone; first, as it now is, and then as it has been.

North of our forest regions comes the zone unwooded from cold, the zone of arctic vegetation. In this, as a rule, the species are the same round the world; as exceptions, some are restricted to a part of the circle.

The polar projection of the earth down to the northern tropic, as here exhibited, shows to the eye—as our maps do not—how all the lands come together into one region, and how natural it may be for the same species, under homogenous conditions, to spread over it. When we know, moreover, that sea and land have varied greatly since these species existed, we may well believe that any ocean gaps, now in the way of equable distribution, may have been bridged over. There is now only one considerable gap.

What would happen if a cold period were to come on from the north, and were very slowly to carry the present arctic climate, or something like it, down far into the temperate zone? Why, just what has happened in the glacial period, when the refrigeration somehow pushed all these plants before it down to Southern Europe, to Middle Asia, to the middle and southern part of the United States; and, at length receding, left some parts of them stranded on the Pyrenees, the Alps, the Appenines, the Caucasus, on our White and Rocky mountains, or, wherever they could escape the increasing warmth as well as by ascending mountains as by receding northward at lower levels. Those that kept together at a low level, and made good their retreat, from the main body of present arctic vegetation. Those that took to the mountains had their line of retreat cut off, and hold their positions on the mountain tops under cover of the frigid climate due to elevation. The conditions of these on different continents or different mountains are similar, but not wholly alike. Some species proved better adapted to one, some to another, part of the world; where less adapted, or less adaptable, they have perished; where better adapted, they continue—with or without some change—and hence the diversification of alpine plants, as well as the general likeness through all the northern hemisphere.

All this exactly applies to the temperate zone vegetation, and to the trees that we are concerned with. The clew was seized when the fossil botany of the high arctic regions came to light; when it was demonstrated that in the times next preceding the glacial period—in the latest tertiary—from Spitzbergen and Iceland to Greenland and Kamtschatka, a climate like that we now enjoy prevailed, and forests like those of New England and Virginia, and of California, clothed the land. We infer the climate from the trees; and the trees give sure indications of the climate.

I had divined and published the explanation long before I knew of the fossil plants. These, since made known, render the inference sure, and give us a clear idea of just what the climate was. At the time we speak of, Greenland, Spitzbergen and our arctic seashore, had the climate of Pennsylvania and Virginia now. It would take too much time to enumerate the sorts of trees that have been identified by their leaves and fruits in the arctic later tertiary deposits.

I can only say, at large, that the same species have been found all round the world; that the richest and most extensive finds are in Greenland; that they comprise most of the sorts which I have spoken of, as American trees which once lived in Europe—magnolias, sassafras, hickories, gum trees, our identical Southern cypress (for all we can see of difference), and especially Sequoias, not only the two which obviously answer to the two big trees now peculiar to California, but several others, that they equally comprise trees now peculiar to Japan and China, three kinds of gingko trees, for instance, one of them not evidently distinguishable from the Japan species which alone survives; that we have evidence, not merely of pines and maples, poplars, birches, lindens, and whatever else characterize the temperate zone forests of our era, but also of particular species of these, so like those of our own time and country, that we may fairly reckon them as the ancestors of several of ours. Long genealogies always deal more or less in conjecture; but we appear to be within the limits of scientific inference when we announce that our existing temperate trees came from the north, and within the bounds of nigh probability when we claim not a few of them as the originals of present species. Remains of the same plants have been found fossil in our temperate region, as well as in Europe.

Here, then, we have reached a fair answer to the question how the same or similar species of our trees came to be so dispersed over such widely separated continents. The lands all diverge from a polar center, and their proximate portions—however different from their present configuration and extent, and however changed at different times—were once the home of those trees, where they flourished in a temperate climate. The cold period which followed, and which doubtless came on by very slow degrees during ages of time, must have long before its culmination have brought down to our latitudes, with the similar climate, the forest they possess now; or rather the ancestors of it. During this long (and we may believe first) occupancy of Europe and the United States, were deposited in pools and shallow waters the cast leaves, fruits, and occasionally branches, which are imbedded in what are called miocene tertiary or later deposits, most abundant in Europe, from which the American character of the vegetation of the period is inferred. Geologists give the same name to these beds, in Greenland and Southern Europe, because they contain the remains of identical and very similar species of plants; and they used to regard them as of the same age on account of this identity. But in fact this identity is good evidence that they cannot be synchronous. The beds in the lower latitudes must be later, and were forming when Greenland probably had very nearly the climate which it has now.

Wherefore the high, and not the low, latitudes must be assumed as the birthplace of our present flora;* and the present arctic vegetation is best regarded as a derivative of the temperate. This flora, which when circumpolar, was as nearly homogeneous round the high latitudes as the arctic vegetation is now, when slowly translated into lower latitudes, would preserve its homogeneousness enough to account for the actual distribution of the same and similar species round the world, and for original endowment of Europe with what we now call American types. It would also vary or be selected from by the increasing differentiation of climate in the divergent continents, and on their different sides, in a way which might well account for the present diversification. From an early period, the system of the winds, the great ocean currents (however they may have oscillated north and south), and the general proportions and features of the continents in our latitude (at least of the American continent) were much the same as now, so that species of plants, ever so little adapted or predisposed to cold winters and hot summers, would abide and be developed on the eastern side of continents, therefore in the Atlantic United States and in Japan and Manchuria; those with prefereuce for milder winters would incline to the western sides; those disposed to tolerate dryness would tend to interiors, or to regions lacking summer rain. So that, if the same thousand species were thrust promiscuously into these several districts, and carried slowly onward in the way supposed, they would inevitably be shifted in such a manner that the survival of the fittest for each district might explain the present diversity.

Besides, there are re-siftings to take into the account. The glacial period or refrigeration from the north, which at its inception forced the temperate flora into our latitude, at its culmination must have carried much or most of it quite beyond. To what extent displaced, and how far superseded by the vegetation which in our day borders the ice, or by ice itself, it is difficult to form more than general conjectures—so different and conflicting are the views of geologists upon the glacial period. But upon any, or almost any, of these views, it is safe to conclude that temperate vegetation, such as preceded the refrigeration and has now again succeeded it, was either thrust out of Northern Europe and the Northern Atlantic States, or was reduced to precarious existence and diminished forms. It also appears that, on our own continent at least, a milder climate than the present, and a considerable submergence of land, transiently superveued at the north, to which the vegetation must have sensibly responded by a northward movement, from which it afterward receded.

All these vicissitudes must have left their impress upon the actual vegetation, and particularly upon the trees. They furnish probable reason for the loss of American types sustained by Europe.

I conceive that three things have conspired to this loss. First, Europe, hardly extending south of latitude 40°, is all within the limits generally assigned to severe glacial action.

*This takes for granted, after Nordenskiold, that there was no preceding glacial period, as neither paleontology nor the study of arctic sedimentary strata afford any evidence of it. Or if they were any, it was too remote in time to concern the present question.

Second, its mountains trend east and west, from the Pyrenees to the Carpathians and the Caucasus beyond, near its southern border; and they had glaciers of their own, which must have begun their operations, and poured down the northward flanks, while the plains were still covered with forest ou the retreat from the great ice-wave coming from the north. Attacked both on front and rear, much of the forest must have perished then and there. Third, across the line of retreat of those which may have flanked the mountain ranges, or were stationed south of them, stretched the Mediterranean, an impassable barrier. Some hardy trees may have eked out their existence on the northern shore of the Mediterranean and the Atlantic coast. But we doubt not, taxodium and Sequoias, magnolias and Liquidambars, and even hickories and the like were among the missing. Escape by the east, and rehabilitation from that quarter until a very late period, was apparently prevented by the prolongation of the Mediterranean to the Caspian, and thence to the Siberian ocean. If we accept the supposition of Nordenskiold, that anterior to the glacial period, Europe was "bounded on the south by an ocean extending from the Atlantic over the present deserts of Sahara and Central Asia to the Pacific," all chance of these American types having escaped from or re-entered Europe from the south and east, is excluded. Europe may thus be conceived to have been for a time somewhat in the condition in which Greenland is now, and, indeed, to have been connected with Greenland in this or in earlier times. Such a junction, cutting off access of the Gulf stream to the polar sea, would, as some think, other things remaining as they are, almost of itself give glaciation to Europe. Greenland may be referred to, by way of comparison, as a country which, having undergone extreme glaciation, bears the marks of it in the extreme poverty of its flora, and in the absence of the plants to which its southern portion, extending 6° below the arctic circle, might be entitled. It ought to have trees, and might support them. But since destruction by glaciation, no way has been open for their return. Europe fared much better, but suffered in its degree in a similar way.

Turning for a moment to the American continent for a contrast, we find the land unbroken and open down to the tropic, and the mountains running north and south. The trees, when touched on the north by the on-coming refrigeration, had only to move their southern border southward, along an open way, as far as the exigency required; and there was no impediment to their due return. Then the more southern latitude of the United States gave great advantage over Europe. On the Atlantic border, proper glaciation was felt only in the northern part, down to about latitude 40°. In the interior of the country, owing doubtless to greater dryness and summer heat, the limit receded greatly northward in the Mississippi valley, and gave only local glaciers to the Rocky mountains; and no volcanic outbreaks or violent changes of any kind have here occurred since the types of our present vegetation came to the land. So our lines have been cast in pleasant places, and the goodly heritage of forest trees is one of the consequences.

The still greater richness of Northeast Asia in arboreal vegetation may find explanation in the prevalence of particularly favorable conditions, both ante-glacial and recent. The trees of the miocene circumpolar forest appear to have found there a secure home; and the Japanese islands, to which most of these trees belong, must be remarkably adapted to them. The situation of these islands—analogous to that of Great Britain, but with the advantage of lower latitude and greater sunshine—their ample extent north and south, their diversified configuration, their proximity to the great Pacific Gulf stream, by which a vast body of warm water sweeps along their accentuated shores, and the comparatively equable diffusion of rain throughout the year, all probably conspire to the preservation and development of an originally ample inheritance.

The case of the Pacific forest is remarkable and paradoxical. It is, as we know, the sole refuge of the most characteristic and wide spread type of miocene coniferæ, the Sequoias; it is rich in coniferous types beyond any country except Japan; in its gold-bearing gravels are indications that it possessed, seemingly down to the very beginning of the glacial period, magnolias and beeches, a true chestnut, Liquidambar, elms, and other trees now wholly wanting to that side of the continent, though common both to Japan and to Atlantic North America.* Any attempted explanation of this extreme paucity of the usually major constituents of forest, along with a great development of the minor, or coniferous, element, would take us quite too far, and would bring us to mere conjectures.

Much may be attributed to late glaciation;† something to the tremendous outpours of lava which, immediately before the period of refrigeration, deeply covered a very large part of the forest area; much to the narrowness of the forest belt, to the want of summer rain, and to the most unequal and precarious distribution of that of winter.

Upon all these topics, questions open which we are not prepared to discuss. I have done all that I could hope to do in one lecture if I have distinctly shown that the races of trees, like the races of men, have come down to us through a pre-historic (or pre-natural-historic) period; and that the explanation of the present condition is to be sought in the past, and traced in vestiges, and remains, and survivals; that for the vegetable kingdom also there is a veritable archæology.

*See, especially, report on the fossil plants of the auriferous gravel deposits of the Sierra Nevada, by L. Lesquereux; Mem. Mus. Comp. Zoology, vi., No. 2. Determinations of fossil leaves, etc., such as these, may be relied on to this extent by the general botanist, however wary of specific and many generic identifications. These must be mainly left to the expert in fossil botany.

†Sir Joseph Hooker, in an important lecture delivered to the Royal Institution of Great Britain, April 12th, insists much on this.

Useful Information.

The Blue Process of Copying Tracings, etc.

This process is now extensively used in the drawing-rooms of a number of firms and companies, and saves not only much labor but a great deal of weariness to the junior draftsmen to whose lot it usually falls to make copies or tracings of drawings. The *Railroad Gazette* says that in the office of Messrs. William Sellers & Co., and in the drawing-room of the Pennsylvania railroad at Altoona, all tracings, when more than one copy is required, are made by this method. It is described as follows in a short paper read by Mr. P. Baruce before the Institute of Mining Engineers:

The process is believed to be of French origin, and has been used for many years. Special attention seems to have been directed to it recently, and its great value to engineers appears likely to be fully recognized.

The manipulations required are of the simplest possible kind, and are entirely within the skill and comprehension of any office boy who can be trusted to copy a letter in an ordinary press.

These particulars may be summarized somewhat thus:

1. Provide a flat board as large as the tracing which is to be copied.

2. Lay on this board two or three thicknesses of common blanket, or its equivalent, to give a slightly yielding backing for the paper.

3. Lay on the blanket the prepared paper with the sensitive side uppermost.

4. Lay on this paper the tracing, smoothing it out as perfectly as possible so as to insure a perfect contact with the paper.

5. Lay on the tracing a plate of clear glass, which should be heavy enough to press the tracing close down upon the paper. Ordinary plate-glass of $\frac{3}{16}$" thickness is quite sufficient.

6. Expose the whole to a clear sunlight, by pushing it out on a shelf from an ordinary window, or in any other convenient way, for six to ten minutes. If a clear skylight only can be had, the exposure must be continued for thirty or forty-five minutes, and under a cloudy sky, sixty to ninety minutes may be needed.

7. Remove the prepared paper and drench it freely for one or two minutes in clean water, and hang it up by one corner to dry.

Any good hard paper may be employed (from even a leaf from a press copy-book up to Bristol board) which will bear the necessary wetting.

For the sensitizing solution take 1¾ oz. citrate of iron and ammunia and 8 oz. clean water; and also, 1¾ oz. red prussiate of potash and 8 oz. clean water; dissolve these separately and mix them, keeping the solution in a yellow glass bottle, or carefully protected from the light.

The paper may be very conveniently coated with a sponge of four inches diameter, with one flat side. The paper may be gone over once with the sponge quite moist with the solution, and a second time with the sponge squeezed very dry. The sheet should then be laid away to dry in a dark place, as in a drawer, and must be shielded from the light until it is to be used. When dry the paper is of a full yellow or brown color; after the exposure to the light the surface becomes a darker bronze, and the lines of the tracing appear as still darker on the surface. Upon washing the paper the characteristic blue tint appears, with the lines of the tracing in vivid contrast.

It will readily be seen that the process is strictly photographic, in the ordinary sense of the word—the tracing taking the place in the printing of the ordinary glass negative. Hence all details are closely reproduced, even to the texture or threads of the tracing-cloth.

A working drawing thus made furnishes its own background, and does not require to be placed over a white ground, as is often the case with a tracing. If desired the copy can be made upon common hand paper, which can be mounted upon a board in the usual way.

Inasmuch as such copies can be made from tracings only, it may be well to suggest, and urge, that drawings can be completed or nearly so in pencil upon paper in the usual way, and that all the inking can be done upon tracing-cloth laid upon the pencil-work. In this way the cost of the tracing (in the ordinary sense) can be wholly saved, and the single copy of the finished tracing can thus be made in the "blue" way to the best possible advantage.

It may safely be said that this method of copying can be employed if only one or two copies per week are needed of ordinarily complex drawing, with excellent results and with a very important saving of time and money.

A ready means of adding to or correcting the blue copies may be found in the use of a solution of carbonate of soda or potash, used with a pen or brush.

The Preservation of Iron Surfaces.—Mr. J. Gordon, of Carron, Falkirk, writes to *Engineering* as follows: In your journal, dated 9th current, I have just read with interest your remarks on Mr. Bower's process for the preservation of iron surfaces. After perusal, about twelve months ago, of Professor Barff's pamphlet on the subject of his patent, it at once occurred to me, as it has also to Mr. Bower, that the oxygen of air would have the same combining effect with heated iron surfaces as the oxygen of superheated steam. I therefore at that time, and have since, exposed several small pieces of iron, both malleable and cast, to the hot air used at the blast furnaces here, my belief being that the hot blast would itself raise the pieces of iron to the desired temperature, and also furnish the requisite oxygen for the formation of the coating of magnetic oxide on their surfaces. This opinion was confirmed by the experiment. The surfaces of the articles were found to be covered with the magnetic oxide, and where the coating was complete it perfectly resisted the oxidizing action of water or moist air; its powers of resistance seemingly bearing a proportion to the duration of time to which the surfaces were exposed to the hot blast.

Enlarging Figures for Molders' Patterns.—In the Italian department at Paris there is a system for enlarging busts, etc., which ought to be worth something to bronze founders, etc. The bust to be copied is marked off into equidistant horizontal planes, and also into radial vertical planes axial with its center line; the distances are carefully calipered; and a honeycomb frame, first built up of thin wooden boards, arranged in planes symmetrical with the marking on the original, is cut out to depths corresponding to the caliperings on the original. The interstices are then filled up with wood or with plaster material.

New Mixture for Oiling Wool.—One part of best resin, powdered, is mixed with equal weight of spirits of ammonia free from lime, and ten times this weight of water, and stirred cold until a jelly is obtained; this is then strained through a fine sieve to remove all undissolved particles of resin; and mixed with an equal weight of rape-oil, olive-oil, oleine, or any other oil suitable for oiling the wool, forming an emulsion, to which is added one hundredth part of its weight of glycerine. When using, this mixture is diluted with about half its weight of water, and treated as usual.

Cement.—For joining the porcelain beads to the metal spikes used for ornamental nails, a German authority recommends the use of a thick paste made of a mixture of Portland cement and glue. The same mixture is recommended as an excellent cement for foot-walks.

Good Health.

Cold and Warm Baths.

A writer in the London *Lancet* says: The effects of baths are produced mainly by their action on the cutaneous nerves. The sudden immersion of the body in cold water produces a shock, which is followed by a slight shiver in the muscle, and the contraction of the cutaneous capillaries. There is often also a slight gasping of the breath. There is a feeling of cold, and the temperature is at first slightly elevated and then depressed. The pulse and respiration are both quickened, and the amount of carbonic acid eliminated by the lungs is notably increased. If the water be very cold and the bath continued, these symptoms deepen in intensity; but if the body be quickly removed from the bath, the familiar phenomenon known as reaction appears, and the first effects are all reversed: there is dilatation of the cutaneous vessels, accompanied by a sensation of warmth and a general feeling of vigor. The cooling effect of a cold bath is brought about, probably, in two ways: first, by the actual conduction of heat from the surface of the body by cold water; and, secondly, by a modification of heat production, induced by the influence of the cutaneous impressions upon the heat-regulating centers in the upper part of the spinal cord and the medulla. The very rapid depression of temperature which takes place when hyperpyretic patients are immersed in water can hardly be explained by reference merely to the ordinary laws of heat, and it is almost certain that the central effects produced by cutaneous impressions play a very large, if not the largest, part in the process. The effects of the cold bath being mainly due to impressions made upon the cutaneous nerves, the modifications of the cold bath largely depend on their power of increasing its stimulating action. The colder the water, the more violent the impression. The frequent change of water, such as we get in the sea or in running streams, increases the stimulating effect. Great force of impact, as when water falls from a hight or comes forcibly through a hose upon the body; the division of the stream, as is seen in shower baths and needle baths; and the addition of acids or salt to the water, all act, it would seem, by increasing the stimulating power which the water exerts upon the cutaneous nerves.

Warm baths produce an effect upon the skin directly contrary to that which is brought about by cold water. The cutaneous vessels dilate immediately under the influence of the heat, and although this dilation is followed by a contraction of the vessels, this contraction is seldom excessive; and the ultimate result of a warm bath is to increase the cutaneous circulation. The pulse and respiration are both quickened as in the cold bath. The warm bath increases the temperature of the body, and, by lessening the necessity for the internal production of heat, it decreases the call which is made upon certain of the vital processes, and enables life to be sustained with a less expenditure of force. While a cold bath causes a certain stiffness of the muscles, if continued for too long a time, a warm bath relieves stiffness and fatigue, as every hunting man must know full well. The ultimate results of hot and cold baths, if their temperature be moderate, is about the same, the difference being, to use the words of Braun, that "cold refreshes by stimulating the functions, heat by physically facilitating them; and in this lies the important practical difference between the cold-water system and the thermal method of treatment."

How the Body is Built Up.

The muscle and fat of the body, remarks the *Journal of Chemistry*, are derived from the food, and animal heat is evolved from their combustion or their combination with the oxygen admitted by the lungs. When the muscles are inactive, slow combustion goes on; and for every grain of carbon burned, a perfectly definite amount of heat is produced. When the muscles contract, the combustion is quickened, and the additional heat is liberated in the muscles themselves. If external work be done, as in lifting a weight or hammering a nail, the heat is no longer developed in the body, but transferred to the weight lifted or the raised hammer, and is liberated when they fall, and the heat thus liberated is exactly equal to the combustion inside the body. Thus the body is an apparatus efficient beyond all others in transforming and distributing the energy with which it is supplied, but it possesses no creative power. A man weighing 150 pounds, by the consumption of a single grain of carbon can lift his body to a hight of eight feet, and by the consumption of two ounces, four drachms, twenty grains, to a hight of ten thousand feet. Mayer maintains, against Liebig and others, that the muscles in the main play the part of machinery, converting fat into the motive power of the organism. He saw that neither nerves nor brain possessed the energy necessary to animal motion, and believed they held fast or let loose muscular energy as an engineer, by the motion of his finger in opening or closing a valve, liberates and controls the mechanical energy of a steam-engine. These views are now quite generally accepted by scientific men.

Fumigation in Asthma.—At a meeting of a medical society in Philadelphia, Dr. W. M. Welch called attention to his treatment of asthma by fumigation. The powder to be burned is composed of two and one-half parts of nitrate of potassium, one-half part of belladonna and five parts of powdered stramonium leaves, intimately mixed with a small proportion, say one-half part, of pulverized white sugar, the latter being added to prevent the compound from burning too freely. The saltpeter may be dissolved in just enough water to make a saturated solution, which is mixed with the leaves, and subsequently the mass dried into a coarse powder, and sugar added. A small quantity is placed on a brick or tin plate and ignited, when it burns, giving off a cloud of smoke. He occasionally spreads sheets over a clothes-horse for the purpose of confining the fumes, and had obtained very satisfactory results during paroxysms of asthma.

Turpentine Vapor in Accidents from Chloroform Vapor.—Dr. Wachsmuth, of Berlin, has suggested a preventive of those accidents which frequently occur in the administration of chloroform to produce anæsthesia. He says: It consists in the addition of one part of rectified oil of turpentine to five parts of chloroform. The oil of turpentine in vapor appears to exert a stimulating or life-giving effect on the lungs, and protects these organs from passing into that paralyzed state which seems to be produced by chloroform narcosis. Dr. Wachsmuth, while lying on a sick bed, accidentally breathed the vapor of turpentine, and he experienced from this a strongly refreshing feeling. This fact induced him to try the plan of adding oil of turpentine to chloroform when the latter was used for anæsthetic purposes. The beneficial results surpassed his expectation.

Death from a Toy.—The London *Lancet* states that a little child at Briton has been killed by accidentally swallowing a squeaking air-bladder. It appeare that the toy slipped through the glottis with the bladder downwards, and the quill mouthpiece upwards, so that with every inspiration the bladder became more or less inflated, and thus prevented the entrance of air to the lungs, and produced death by suffocation. A verdict of "accidentally suffocated" was returned by the jury. The case must be unique.

No Stimulants.—The *Doctor* says that the other day a physician, to a patient inquiring, "What ought I to take or to do when my feelings of exhaustion come on?" replied, "Go and lie down like any other beast."

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Artesian Wells.—No. 2; The South Pacific Coast Railroad, 241. The Week; Los Angeles as a Mining County; Notes on Contributions to our Cabinet; Carbon Paint as a Preventive of the Oxidation of Iron, 243. A Cure for Loose Tires; Mines and Works of Almaden.—No. 5, 249. Notices of Recent Patents, 252.
ILLUSTRATIONS.—Artesian Wells in San Francisco, 241. Cross-Section of Veins at Almaden; Miles' Improved Tire Setter, 249. Tuckahoe or Indian Head, 243.
CORRESPONDENCE.—Carson City, Nevada.—No. 1, 242.
MECHANICAL PROGRESS.—The Telemachon; An English Ore Crusher; A Cain for the Bobtail Cars; An English Magnetic Engine; A New Metal; A Suggestion for Machine Shop Builders; Submarine Electric Light; The Screw Propeller; Steam Road Wagon; A European Railroad Turn-table; An American Locomotive's Tour Through Europe, 243.
SCIENTIFIC PROGRESS.—Investigation Into the Food Supplies of Trout; A Controversy About Mosandrum; Notes on the Interior Rivers; The Sinking of New York Island; A Claimed Discovery in Sugar Crystallization; A New Manganese Battery; Heat Conductivity; Solar Observations, 243.
MINING SUMMARY from the various counties of California, Nevada and Utah, 244-45.
MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 244.
NEWS IN BRIEF on 252 and other pages.
USEFUL INFORMATION.—The Blue Process of Copying Tracings, etc.; The Preservation of Iron Surfaces; Enlarging Figures for Molders' Patterns; New Mixture for Oiling Wool; Cement, 247.
GOOD HEALTH.—Cold and Warm Baths; How the Body is Built Up; Fumigation in Asthma; Turpentine Vapor in Accidents from Chloroform Vapor; Death from a Toy; No Stimulants, 247.
MISCELLANEOUS—A Mammoth Tree; An Opening for American Woolens in China; Cocoanut Oil Manufacture; Mineralization of Gold, 242. A Curious Edible Fungus; New Incorporations; The Atlantic and Pacific Forests—No. 7, 246-7. The Mines and the Courts, 248.

NEW ADVERTISEMENTS.

The Week.

The week was ushered in hy news of anotber conflagration at a mine. On October 13th the hoisting works of the Lady Bryan mine took fire and hurned to the grownd. As is usual, the exact cause is not known. If, as binted, it was started hy a fireman's lamp, the company have probahly to thank carelessness for this drain of $30,000 or more upon their pockets. Work of repairing and rehuilding bas commenced as promptly as it did at the Richmond. Exceptiug tbis disaster, all has gone well on the Comstock, and this notwithstanding the condition of the stock market. Tbe Gold Hill *News* of the 16th inst. says:

"Stocks are down—have hroken fearfully during the week, hut tbose most familiar with the mines and developments on the line of the Comstock look at home in vain for the cause."

Reports from the outside mines are generally very good.

Tbe fall in the price of silver may affect the mincs to a considerable extent. It is not yet fully explained and those who a few moutbs ago propbssied a rise in the market, do not dare announce even a hope that it will soon become better.

Bodie wants more hotel accommodation. That may be a good sign; hut these rushes often are followed hy dangerous reaction. Silverado has hean promised what she has cried for so long—a mill—and is juhilant. The *Silver State* thinks it sees a mining revival threatening in Humboldt county. The Richmond furnaces will be rapidly rehuilt. Their destruction has heen much like all "ill winds." Because of it, the lead market has become a little firmer, which must accrue to the hsnsfit of many struggling camps in Utah and Nevada.

Los Angeles as a Mining County.

Was there prophetic virtus in the fact that almost tbe first mining in Califoruia was done in Los Angeles county? Seven years before the heginning of the "New Era," which in 1848 was usbered in by Marshall's discovery of the Sutter Mill placers, a Frenchman, Baric by name, was working away at gold-bearing quartz near tbe Mission of San Fernando. But when the placer excitement commenced, no one tbought of looking for mineral wealth in this chosen county of tbe sunny south. This beautiful land was left for the farmer and tbs borticulturist. Los Angeles was never placed among the counties of tbe great "Motber Vein," and was not thought of as related to the silver-bearing mountains of Inyo, altbongb the mountains near the southern corner of ths county bave been considered hy geologists as belonging to the Sierra Nevada range. About 1861, when the Geological Survey explored the county, copper and silver ore were brought tbem from ths San Gabriel mountains. The ore was found in cretaceous formation, and the survey decided tbat the deposits could not prove profitahls. The survey reported also some little gold-washing in ths same mountains, but not enough to excite attention. When the explorers ascended the peaks and viewed tbe ranges to tbe soutb, they pronounced tbem wild, chaparral-covered and little known, and added, that no indications of metalliferous ores were observed in the Santa Ana mountains.

In tbe Temsscal range, just over the boundary of the county, tiu has been discovered, ore tbat has assayed as bigh as 60% of the metal; hut nothing bas come of it, and a very recent writer says: "Tbs tunnels and shafts are all full of water, and everything looks quits as dilapidated as Rip Van Winkle's old gun." Later, coal was discovered near tbe Santa Ana river. Neitber did this attract much attention, and of one of the "locations," a gentleman wbo visited the place in 1872, and pnblished bis report as late as 1877, says tersely: "Tbe whole thing is worthless." Of over 1,300 specimens sent to the Paris cxpositiou, Los Angelcs county claims hut two, and neither one of these is characteristic, one being a copper and the otber a quicksilver ore.

Visitors who bave passed through tbe county in midsummer—wbo have felt the warm sun and genial breeze of its semi-tropic climate, and feasted tbe æsthetic eye and the more suhstantial inner man amoug the green groves of the orange and lemon—remember the county as a land literally "flowing in milk and honey," where the wheat, and the corn aud the tropical fruits grow side by side, even at the fect of snow-capped peaks. But no one has ever thougbt or spoken of Los Angeles as a mining county.

There lies now on tbe desk before us a box of minerals from the Silverado region in the southeastern part of Los Augeles county. There are 12 specimens. One professes to he a tin ore. Another is coal. Anotber is a brilliant sulpburet from a gold mine. And the remainder are supposed to be ores of silver. None of these have been assayed, but they remind us that others like them and from the same place bave been put to the test and not fonnd wanting. Tbey remind us that hundreds and thousands of miners bave been rusbing to this new mining conuty within the last month or two, that numberless claims bave been staked out, tbat ores have been extracted and eveu shipped to San Francisco, tbat opinions of experts bave been sougbt aud given, tbat developments bave been made sufficient to warrant a call for a mill—a call, too, that bas not gone unauswered, and that the permanence of tbe mines bas been assured so as to revive trade in the neighboring towns and make a cousiderable market for the otber class of products of the couuty, drawing supplies from Anaheim if not from Los Angeles itself.

Notwithstanding the verdict of the visitor of 1872, Los Angeles coal has become a product of no little importance. It bas not become widely known as yet, nor are sufficient facts at hand to warrant a final judgment of it. But this much is certain: considerable capital has found its way into the mines and quite large shipments of coal have been made.

Besides the Silverado district and the Black Star coal mines, another part of the county now claims notice for its mineral deposits. But a week or so ago the discovery of large tracts of graphite was reported, almost simultaneously with a similar report from Shasta county. The exact location we believe is not generally known. If the heds ars of good quality and in considerahle quantity, they will in time prove valuahle.

We have seen no account of the discovery of the Silverado mines. Such an account would be very welcome now. But we have no doubt that the fast increasing development may he laid at the door of the hard times that have driven many sensible mcn fresh from the overcrowded cities, to seek wages hy prospecting or by working persistently and economically old ahandoned claims. Such outgrowths from tbe hard times have been noticed in other counties. A revival in Nevada county may be instanced, and the discovery and opsning up of mining districts in other parts of California and in Nevada, may with show of reason he ascribed to this cause. But wherever the credit of it lies, the good has heen done, and Los Angeles is henceforth listed as a mining county.

Notes on Contributions to Our Cabinet.*

We acknowledge the receipt, from P. A. Clark, Esq., of Silverado, Los Angeles Co., of twelve specimens from that neighborhood. We bave sbown them to Mr. J. S. Phillips, of 504 Wasbington. street, San Francisco, and wbat we say of them is upon bis authority. We give them witb our cahinet nnmbers:

No. 553. Dunlop location, Blus Light Co., 2d extension south on Grayback lode, Santa Rosa mining district. Sulphurets of antimony and lead in ferruginous quartzose rock. Probably silver ore.

No. 554. Blus Light location, Ist extension south on Grayback lode. Sulphurets of antimony and lead, in hornblendic and quartoze rock. Probably silver ore.

No. 555. Flannigan location, 3d extension south, Grayback lode. Sulphurets of antimony, lead and iron, with carbonate of lime and hornblendic gangue. Probably silver ore.

No. 556. Same locality as No. 555. Sulphuret of lead, with carbonate of lime and hornblendic gangue. Appearance of chloride of silver. Shonld be assayed.

No. 557. Specimen of coal from Santa Clara coal mine about five miles west of Silverado and about one mile west of cbange in formation from limestone and slate to sandstone and slate, and about five miles south of the Black Star mine. Witbout making elahorate tests should say it is very good coal, better tban tbat obtained in tbe Mount Diablo region.

No. 558. Southern Slope Galena lods, Santa Rosa mining district. No galena; sulphuret of zinc (black jack), in hornblendic limestone and calcite.

No. 559. Southern Slope Co., Galena lods. Very heavy; sulphuret of antimony witb calcareous gangue.

No. 560. Mountain View Co., Grayback lode, 1st extension north. Character of ore found in tbe canyons on tbis lode. Blue carbonate of copper (azevite) sulpburet of lead and probably silver. Shonld be assayed.

No. 561. Montezuma Co., Ophir lode. Tbe Ophir is a gold mine. Very brittle sulphuret of iron, with quartz and calcite. Probably auriferous.

No. 562. California Con., No. 1, American Union lode, Shrewsberry canyon, tbree miles south of the Blue Light mine. Sulphurets of iron and zinc (pyrite and sphalerite) with quartz.

No. 563. Great Fall Co., and lode, Shrewsberry canyon, Santa Rosa district. Sulphuret and arseniuret of iron (pyrite and arsenopyrite) witb hornblende and feldspar.

No. 564. Tin ors, Georgs Wasbington Co., and lode; ledge crops out 40 feet wide, traceable for several miles. Looks like hornblendic mixture. Tin doubtful. Cannot judge without an assay. The Temescal tin ores are said to be very peculiar, different from tin ores from any other locality. Hence tbe difficulty of judging.

*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and safely kept. A full account of the place, occurrence, etc., adds much to the value of such contributions. In another column we will gladly answer any reasonable questions regarding specimens so contributed.

Return of Our Commissioner.—Within a week Mr. Henry G. Hanks will be witb us again. The work that be has accomplished for our coast is already too well known to need notice now. And it would be superfluous to say tbat he will be gladly welcomed, as he bears bome our laurels. He bas, too, laurels of his own, which he richly deserves. Tbe French gave him a diploma of honor and a gold medal, as tokens of their appreciation of the skill and judgment exhibited hy him in his management of the Pacific coast display. And when he is hack at home he will be rewarded not only by our esteem hut hy the sight of new enterprises, supported by foreign capital, growing up among us, as monuments of the good services he has rendered. This is no chimera, as time will very soon show.

Patronize Them.—Persons having book hinding to do cannot do hetter than call on Bartling & Kimball, No. 505 Clay street. Tbey do uniformly good work, and in former years bave exhibited beautiful specimens of ornamental and gilt edge hinding, rich and durahle, which would he a credit to tbe trade anywhere in the civilized world. Having a large estahblishment and every appliance of the trade, they manufacture any style of blank hook required, and do up this and other johs in the hook binding line at short notice.

A system of loading hsavy guns hy means of compressed air has heen iuvented by R. C. Smith, of Edinhurgh, Scotland. The rammer consists of a series of telescopic tubes, into wbich the air is admitted so that when tbe cbarge is thus thrust home communicatiou is establisbed hetween the rearmost tuhe and a series of internal tuhes (which are extended along with the others) permitting the air to escape. Sponging is effected in the same way. The wbole process is said to be very expeditious.

A new mining camp has recently been started 14 miles ahove Poncha springs, Colorado. The district bids fair to he a lively one.

Carbon Paint as a Preventive of the Oxidation of Iron.

Dr. Lanszweert, a chemist of this city, has beeu conducting a series of experiments during many years for tbe purpose of finding some preparation tbat could bs placed upon iron, and so change the surface and become a part of it, as to prevent oxidation, eitber in ths air or in salt water. Tbese experiments have resulted in tbe discovery of a preparation of almost purs carbon, with other ingredisnts, wbich, whsn applied to iron, appears to bave the dcsired effect. It bas been placed upon the bottoms of iron and wooden sbips on voyages to England and China, and so far as reports have been received it bas exceeded Dr. Lanszweert's anticipations. It has been noticed, and recorded in scientific journals, that harnacles, otber crustacea, and salt water confervæ, do not attacb to and grow upon charred wood, *the carbon of the charred wood being unfavorable to them.* The basis of this paint being carbon, it appears to bave the same effect, and therefore promises to be of great advantage in preventing tbs fouling of the bottoms of wooden and iron ships.

Dr. L. is now conducting anotber series of experiments, for the purpose of ascertaining if bis carbon preparation, placed upon and incorporated in wood, will resist the attacks of the *teredo* and *limnoria*. For tbis purpose he has prepared planks and timbers, and caused them to be placed in tbe water at various points in our barbor, and also at Santa Monica, where the borers are more tban usually destructive. As these borers are batched, and enter tbe wood especially in May and June, a complete list of these experiments cannot bs announced until the wood has remained in the water for a year.

From all that can be learned of the numsrous tests, it appears to be a snccessful paiut in proventing ths rusting of iron, either in the air or in fresh or salt water. As a paint for both wooden and iron work, it flows freely, and bas a fine, smootb surface. Tbe principal ingredient heing carbon, of course its color is only black; but it makes an excellent fonndation for other colors of the ordinary oil paints.

Dr. Lanszweert has devoted a long life to chemical experiments. In addition to his contributions to purely scientific chemistry, he is confident of having now made a discovery that promiscs to be of great practical aud economic value.

The Mines and the Courts.

Buying on Margins.

The *Bulletin* gives the following statement of the case of G. H. Gray vs. Stephen Otis. Tbe defendant is a stockbroker. On tbe 7tb of January last, Gray requested Otis to sell for bis account ten sbares of Alta mining stock, "seller 10," at $22, handing him $40 as margin. Otis replied that $40 was not a sufficient margin for such a transaction, whereupon Gray promised to make up the usual margin but neglected to do so. Otis sold the stock on the morning of January 7tb, at $22 per share, "seller 10." At ths afternoon session the stock rose some dollars per sbare. On the day following it went to $30, and continued high for several days. On tbe 8tb, Otis "filled" the stock at $28. On the 9th, the defendant met Gray and informed him what he bad done. Gray repudiated the transaction, and on the next day ordered Otis to "fill" for him, the stock being at $14. Otis declined, on the ground that he had already "filled" at $28. Gray brought suit to recover the difference between $14 per sbare, the value of the stock on tbe 10th, and $22, making $80 on the 10 shares, besides tbe $40 margin.

In giving the opinion, Judge Freelon said: Neither party has appealed to any custom or rules of the Stock Boards. The Code and statutes do not provide for such cases. Tbe common law authorities bearing on the case are meager and conflicting. It must he considered that the hroker was in a position to lose everything and gain nothing hut his commission. Had the stock gone to $280 or 2,080 instead of $28, the hroker might have been ruined, or bad it gone down to a dollar, be would have only gained a few cents. If there can he any equity in such a transaction, it seems to he all on the hroker's side, especially as he tried to find Gray to give him notice. Iu tbe cass of Sterling vs. Jaudin, 48 *Barbour*, under like circumstances, no notice even was held necessary. And that autbority goes to show that in just snch a case as the one before the Court, the defendants bad a right to use bis hest judgment as to the time and place of purcbase, heing bound, however, to make tbe purchase at the then market price. Such being the view of the Court, judgment will be given for the defendant, with costs.

Root, Nelson & Co. are proprietors of the Uuion foundry, Sacramento, noticed in our last issue. Mr. Williams recently sold his interest (in the real estate and works) to the present firm—consisting of three partners.

During the week ending with Tuesday, October 8tb, 27,450 pounds of quicksilver and 55,270 pounds of sulphur were shipped from Calistoga to San Francisco.

An extensive cave of the surface into a Scranton, Pa., coal mine, has tbrown from 300 to 400 mcn ont of employment for a time.

Mines and Work of Almaden.—No. 5.

[Translated for the Press from "Annales des Mines."]

III.—Deposits of Mercury.

The ores of mercury which have rendered Almaden so famous dispose themselves nearly in a triangle, whose apexss would be Almaden, the ancient mine of Las Cuevas near Gargantiel, and Almadenejos or Valdeazogues.

Some indications of cinnabar have been found outside of these limits to the west and northwest of Almaden; it seems even, according to the sayings of the people of the country, that spots of cinnabar can be found in certain banks of quartzite for considerable distances; but it is only in the space indicated that the mercury has given rise to researches or serious exploitations. The mins of Las Cuevas has been for a long time abandoned; those of Almadenejos have diminished to such an extent, that about 1860, their exploitation was given up; therefore, all the mercury which Almaden produces comes from the mine situated beneath the town.

The cinnabar is nearly always found in the sedimentary rocks; we have already said that it was known only in a small number of spots in contact with the melaphyre. The principal deposits are in the silurian strata; but it is found also in the devonian. At Guadalperal, in the hill of Hinojo, the beds which contain cinnabar, enclose a large number of fossils of the devonian epoch. At Valdeazogues, the cinnabar forms red spots in a limestone of the same age. To the north of Chillon in the midst of a mass of devonian rocks which run from Chillon to Puerto del Ciervo, we have found banks of quartzite feebly impregnated in places with sulphide of mercury. There have never been found, it is true, fossils in the mass of the ore itself as at Idria, but *bilobites* and *graptolites* have been found in the encasing rocks. The deposit at Guadalperal is in a partly altered frailesca, without fossils, but surrounded by devonian rocks which are full of fossils. It is necessary always to remember that it is in the silurian rocks of Almaden only that mercury is found in quantity sufficient to be advantageously exploited.

1. Description of the Mine of Almaden.

The mine of Almaden comprises three principal deposits, nearly parallel to each other, and with a general direction from east to west. The most southerly one bears the name of San Piedro y San Diego; the two others, very near to each other, bear the names, the one San Francisco, the other San Nicholas. The section, Fig. 8, nearly perpendicular to the direction of the veins, gives us an idea of their bearings.

The cinnabar impregnates certain beds of quartzite or of sandstones, nearly vertical, enclosed by beds of schiste; sometimes the sandstone, impregnated with cinnabar, has for walls other sandstones not impregnated. What is remarkable is that the cinnabar passes at times suddenly from one bank to the other, following the direction of this new stratum whatever its inflections may be. When, on the contrary, the cinnabar leaves the bed of quartzite, to pass to the wall or hanging wall in the schiste, it takes only very restricted development.

The sterility of the schiste is such that pieces of this rock imprisoned in the midst of the cinnabar have been found not to contain a trace of mercury. This fact does not seem to be peculiar to the deposits of Almaden. The schiste, which seems nearly always to exist in the neighborhood of veins of mercury, is generally very poor; it appears to have resisted impregnation, and therefore the mercury is more concentrated in the beds which are more permeable to the mercurial vapors.

Hence, the cinnabar impregnates at Almaden certain beds essentially silicious. It fills spaces more long than wide, however; the small length of these beds, 150 to 180 meters only, compared with their least thickness, 9 to 10 meters, shows that if on account of their origin these deposits should receive the name of veins, they are very far from presenting the ordinary character of vein deposits; there have never been, at least in parts now known, great fissures extending for a considerable distance, filled entirely or in part after their formation. One sees no vein walls, nor symmetrical disposition upon two walls, nor crystallino gangues, nor ramifications (crossings), faults or other accidents usual in most metalliferous mines.

We have already described the rocks of the hillock of Almaden, in which are found the cinnabar veins, and have only a little to add upon their character in the neighborhood of the mineral. In going from south to the north, in any one of the levels, one meets first the frailesca, more metamorphosed in the mine than anywhere else; it is here formed in great part of magnesian limestone; it is very firm, without great hardness, and presents in a great many places drusal cavities, lined with crystals of dolomite. The schiste which one next meets has a coarse texture, sometimes nearly earthy; the parts the most consistent present two systems of fractures, the one longitudinal, the other transverse, but very oblique. In contact with the mineral the schiste is very black, lustrous magnesian, and carboniferous to such an extent as to leave a mark upon the fingers.

Then follow the deposits of San Pedro y San Diego. It is formed of a white sandstone, regularly impregnated with cinnabar. The ore is distinguished by its beautiful red vermilion color, particularly in the western part (San Pedro). Towards the east the ore becomes poorer as we descend, and nearly disappears at a depth of 290 meters. The rich part of the vein forms then in the vein itself a column bearing to the west. In continuing, going from San Pedro towards the north, one traverses first, several meters of black schistes, similar to those of the southern wall, then quartzites with alternating beds of schiste. These quartzites have been also metamorphosed as is proved by their extreme firmness, the small veins of quartz which traverse them, and the geodes with crystals which are found in them.

The next two veins, San Francisco and San Nicholas are separated from each other only by a thin band of quartzite with schistes, comparable to those which separate San Francisco from San Pedro y San Diego; but the sandstone constituting the vein itself is black, while that of San Pedro is white; it is also more hard, more compact, less regular, and less thoroughly impregnated with cinnabar. Likewise the ore of these two deposits is less beautiful, and darker than that of San Pedro. The schiste forms again the northern wall of San Nicholas and prolongs itself far to the north, without enclosing anything of value.

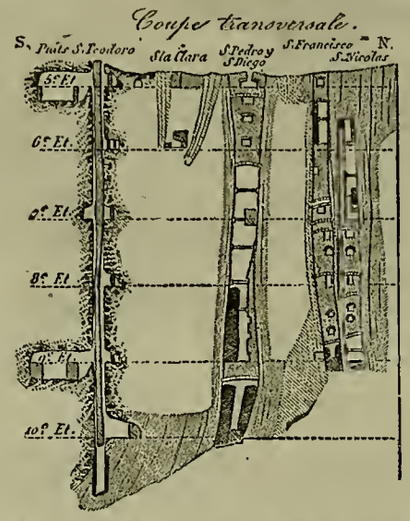

FIG. 8. CROSS-SECTION OF VEINS AT ALMADEN.

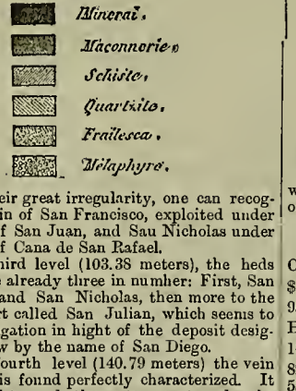
Let us now pass to the study of the veins in depth: The levels exploited or planned are 10 in number. Their depths below the mouth of the shaft San Teodoro are as follows:

1st level (etage)	44.8	meters
2d "	74.30	"
3d "	103.38	"
4th "	140.79	"
5th "	170 47	"
6th "	191.57	"
7th "	215.03	"
8th "	237.64	"
9th "	263.55	"
10th "	288.63	"

The old works of the upper levels are filled in or are in ruins and are absolutely impassable. The following is the only information we could obtain of the position of the vein in the upper levels from an examination of old maps.*

In the first level (depth of 44.80 meters) ore is found toward the eastern extremity, corresponding to-day to the mine of Castillo, that is to say to a shaft opened in the middle of the village of Almaden. This ore was mined by a crosscut called the "Socaoon de Castillo."

The works of the second level are but little developed and indicate but a slight yield. In spite of their great irregularity, one can recognize the vein of San Francisco, exploited under the name of San Juan, and San Nicholas under the name of Cana de San Rafael.



At the third level (103.38 meters), the beds worked are already three in number: First, San Francisco and San Nicholas, then more to the south a part called San Julian, which seems to be a prolongation in hight of the deposit designated below by the name of San Diego.

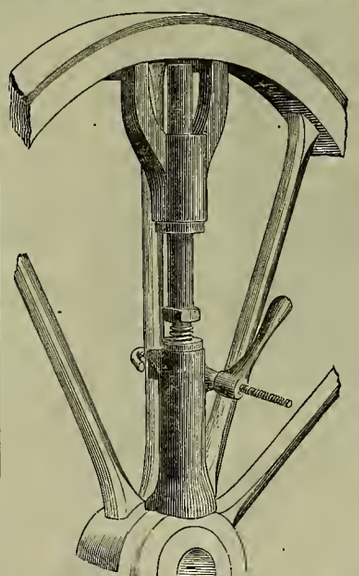
At the fourth level (140.79 meters) the vein San Diego is found perfectly characterized. It is exploited towards the eastern part under the name of San Carlos and San Pablo; its direction at this place is east of west, or more exactly north, 100° east. Towards its western extremity, one observes an interruption in the works, afterwards one sees it again deflected to the south. An agglomeration of ore, joining as it goes down with the San Pedro (western part of San Pedro y San Diego), reaches to the fourth level, where it ends. To the north one still finds the San Francisco and the San Nicholas exploited throughout their eastern part.

From the fifth level the works are in a good state of preservation and everywhere accessible. We give (Figs. 5 to 14) the plans of the different levels. They are so disposed, the one below the other, that the most cursory examination enables one to form an idea of the bearing of the vein at different levels, the drifts, the mason work, and the empty spaces were originally filled with the ore which has been removed. In referring the reader to these plans we can confine ourselves to a concise description by always beginning with the most southern vein.

[To be Continued.]

*For a detailed description, see the work already cited, of M. M. Bernaldez and Rua Figueros.

Sugar Cane Harvester.—Mr. John Howell, of Woodland, Yolo County, has devised a machine which is intended for harvesting sugar cane. The cane has heretofore always been cut by hand, and this machine is intended to serve the same purpose for cane that a reaper does for grain. It is to cut it off close to the ground, and as the stalks fall back into the machine they are carried through a stripper and the leaves stripped off, all at one operation. The machine is propelled over the ground by horses, like an ordinary header. Mr. Howell is desirous of finding some one to interest themselves with him, and assist in defraying the expenses of obtaining patents on the invention.



MILES' IMPROVED TIRE SETTER.

Bullion Shipments.—McCrackin Con., Oct. 9th, $7,524.57; Standard, Oct. 8th, $19,014.16; Jefferson, Oct. 7th, $1,754.95; Indian Queen, Oct. 7th, $5,743.74; Hillside, Oct. 10th, $6,500; 12th, $5,600; 16th, $5,700; Ontario, Oct. 6th, $3,346.82; 7th, $6,082.58; 9th, $3,474.38; 10th, $3,557.08; 11th, $3,077.70; Silver Reef, Oct. 6th, $8,242.42; 9th, $7,536.17; 11th, $3,912.82; Germania, Oct. 7th, $5,000.00; Northern Belle, Oct. 9th, $6,212.43; 12th, $4,509.67; Tybo Con., Oct. 7th, $7,427.04; 11th, $7,431.31; Con. Virginia, Oct. 12th, $50,710.25; California, Oct. 12th, $94,177.46; Sierra Nevada, Oct. 12th, $17,042.83. Total for September, $91,550.19. Belmont, Oct. 10th, $4,054; Independence, Oct. 14th, $12,000; Navajo, Oct. 14th, $7,500.

A Cure for Loose Tires.

A device which will enable a teamster to tighten up his wheels without the labor and expense of a trip to the blacksmith shop, and a long delay while the tire is being "upset" and "shrunken," will often prove of great value. In this dry climate the difficulty from slacking of wheels is much greater than in more humid regions. We illustrate a cheap piece of mechanism on this page which is claimed to do its work most effectively, and not only to act as a speedy cure to the trouble of loose tires, but in its action upon the wheels by enabling the teamster to keep them always taut, makes them last much longer. The tire-setter is the invention of J. A. Miles, the patent being obtained through Dewey & Co.'s agency. It has been widely used during the last few months of busy teaming, and we have seen many testimonials of its satisfactory and valuable work.

The inventor gives the following description of the adaptations of his device: It is calculated that the running gears of a wagon will outlast two sets of wheels by the old method of cutting and resetting; as the tires are belted on the wheels, the wagon is run a large portion of the time when it is too loose to run without injury to it. A wagon should never be run unless it is tight enough to keep the tire to its place without the aid of bolts. Therefore, any appliance for keeping the tire in its place, except for very light wheels, is wrong, as the moving of the tire on the felloe is a sure indication that it should be tightened; and by having this implement at hand you can accomplish the object in a few minutes, which by the old plan would cause a delay of a couple of days, besides an expense that would more than half cover the cost of this machine.

Now, by the aid of this implement, and using it as occasion requires, you can make the wheels last as long as the other parts of the wagon; therefore, you double the lifetime of your wagon, besides saving all expenses of repairing wheels, which is the largest part of the cost of keeping a wagon in running order. There is also the advantage which this plan has over the old process, that after keeping your wheels in just the right condition during the dry season, the leathers can be taken out and that process called dishing is prevented, which ruins more wheels than all other causes combined. For very loose tires it will be necessary to wedge between the ends of one or two of the felloes. They are made to fit all sizes of wheels. It can also be made to answer the purpose of a cheese and wine press, also a jack-screw and wagon-jack, for which purpose it has been especially adapted in its construction.

The principle upon which the tire setter works is quite plainly seen from the engraving, and its mode of use is explained as follows: Place the setter on the hub on the outside of the wheel as it stands on the wagon, opposite the upright spoke (as shown in the cut). Bring the clamp around the spoke and tighten the screw sufficient to hold the spoke from pulling out of the hub; then, with the wrench, raise the felloe from the shoulder of the spoke about an eighth of an inch. Take a piece of rather thin leather, cut a hole as large as the tenon on the spoke, slit it on one side, bring it around the tenon between the spoke and the felloe, loosen the screw and trim down to the size of the spoke. Take the next spoke and bring it to an upright position and serve in the same manner. Continue on until your tire is tight enough. To put in a spoke to replace one that has been broken out, fit your spoke and drive it into the hub; saw the tenon off about one-quarter of an inch in length, place the tiresetter on the hub and raise the felloe until the tenon will slip into place.

The inventor, Mr. J. A. Miles, may be addressed at corner of 26th and Folsom Sts., San Francisco. The setter is also for sale at different points throughout the State.

Yosemite Ramblings.—The Yosemite party of which F. C. S. wrote us in last issue remained for two weeks and a half in the valley, and then continued their ramblings. They went northward through Sonora and Murphy's to the Calaveras Big Trees. Of Sonora, F. C. S. writes: "The rich placers being exhausted the town lost much of its population and active business life, but it has been found that the soil where only gold was sought for as well as the hillsides is capable of producing all that the farmer may desire, and a healthy prosperity is promised. Vineyards, orchards and mulberry plantations, remunerative to the grower and increasing in value, now occupy the deserted mining grounds."

Lake Tahoe, Genoa springs, Carson, Gold Hill and Virginia City, Steamboat springs and Reno were visited. At Virginia City a half day was spent underground in the 1600, 1700 and 1900 levels of the C. & C. shaft. From Reno the party came through the mountains to Sacramento, and thence home.

The San Buenaventura people are predicting that the newly-discovered oil wells about Santa Paula will make that village a second Oil City.

An $8,000 nugget is reported to have been found at Cassiar, where the gold yield is increasing.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME St., N.E. Cor. Pine, S. F.

PATENTS obtained promptly; Caveats filed expeditionsly; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecnted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Two lines of Street Cars pass the Hotel to the Beach and Bath Houses.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc, etc.

TUBBS & CO.,

611 and 613 Front Street, San Francisco.

TO OWNERS OF REBELLIOUS ORES.

Persons interested in mines of rebellious ore, or having on hand any ore that is not satisfactorily worked, yielding less than it assays, will do well to notice the following offer. The undersigned is in possession of a new secret process which he is willing to try on any ores sent to him. If a pound or more of ore is forwarded to his address, he will test it with his process, and acquaint the owner with the results and the cost per ton for working. Address,

S. P. BRESSLER, Elkhardt, Indiana.

LEWIS PETERSON. JOHN OLSSON.

PETERSON & OLSSON,

Model Makers, and Manufacturers of Emblematic Signs. Models for the Patent Office, in Wood or Metal, a Specialty.

NO. 328 BUSH STREET,

Bet. Montgomery and Kearny, (up stairs), San Francisco. All kinds of tin, copper and brass work made to order.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the Mining and Scientific Press, San Francisco, at favorable rates. Send stamp for our circular and samples.

Machinery.

The Ingersoll Rock Drill.

The lightest, most easily adjusted, and only Drill using rubber buffers to protect cylinder-heads, and with Automatic Feed.

Some of the mines using this Drill on the Comstock Lode, Virginia City, Nevada:

Best & Belcher M. Co.,	Con. Virginia M. Co.,
Crown Point M. Co.,	California M. Co.,
Belcher M Co.,	C. & C. Shaft,
Yellow Jacket M. Co.,	Utah M Co.,
Sierra Nevada M. Co.,	Ophir M. Co.,
Silver Hill M. Co.,	Mexican M. Co.,
Sutro Tunnel Co.	Overman M. Co.,
Gould & Curry M Co.,	

REYNOLDS, RIX & CO., Agents.
18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

The Only SAFE BOILER.

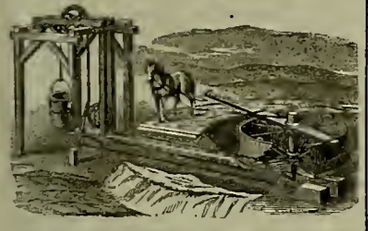
SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,
18 & 20 Fremont Street San Francisco, Cal.

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$3 50
One man, per day	3 00
Wood, 1½ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

SAN FRANCISCO.

SUSPENDED WIRE ROPE TRAMWAYS.

This system of transport is peculiarly adapted for the carriage of minerals over rough countries. Heavy gradients and long spans easily overcome, and cheaper than by any ordinary means.

Transmission of Power by Wire Ropes.

The power of water or steam can by this means be carried for long distances, with great economy.

For estimates and practical information apply to
JOHN SAMSON, Engineer,
No. 743 Pine Street, San Francisco, Cal.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

No. 534 California Street.

Continued from page 245.

ger, Oct. 12: While at the Sierra Buttes mine this week, our attention was called to the casting now being turned out by Taylor & Forbes, of the Downieville foundry. A gentleman connected with the mills remarked that the work looked as though it was intended for exhibition, so finely was it done. They now have about all the trade in their line in this section, and they deserve it.

PLIOCENE.—The machinery at this mine gave out again last week and the mine is now full of water with both pumps at the bottom of the shaft. In less than 36 hours after the stoppage Manson was in San Francisco and had a new steam pump ready for shipment. It left the hay on Monday. The cause of the trouble was the breaking of the head of the double-acting pump, a casting an inch and a half in thickness. While this was being repaired the steam pump gave out and the water rose so rapidly that it was impossible to raise either pump. When the new pump is placed and the others are repaired, any one of the three will he capable of keeping the mine clear of water, and work will advance rapidly it is hoped. The company are hound to reach hottom if money and pluck avail anything.

TUOLUMNE.

DISCOVERY.—*Union-Democrat*, Oct. 12: It is reported that some parties have found a rich veiu or pocket of gold-bearing quartz on land in or adjoining Silas Reed's ranch, Bald mountain. The parties came from Santa Barhara and made the find quickly and easily. How extensive it is we are not informed, other than enough has already heen found to yield quite a sum of money.

ITEMS.—Parties have heen at work on the Monte Cristo mine, near Summersville, for the past three weeks, and the result is some very pretty ore showing free gold and sulphurets. Several of the old placer claims at Jamestown are heing reopened, and oue or two new ones are in full blast; all showiug good indications of netting their owners a golden harvest.

NEVADA.

WASHOE DISTRICT.

CON. VIRGINIA.—Gold Hill *News*, Oct. 16: Daily yield of ore, 190 tons. The south drift on the 1950 level is being steadily advanced, the face in vein porphyry carrying streaks of quartz and low-grade ore.

CALIFORNIA.—Daily yield of ore, 270 tons. The ore stopes on hoth the 1650 and 1750 levels are looking well and are yielding good ore. The north drift on the ore streak on the 1950 level is making steady progress, the face still in ore that will more than pay for the cost of extraction and milling. No. 6 winze below the 1750 level is down 41 feet, the hottom still in low-grade ore. It is expected that this winze will soon reach the west clay wall of the ore vein. The main north drift from the Con. shaft on the 1650 level is in a distance of 518 feet, the face in low-grade ore and quartz.

SIERRA NEVADA.—Assays of samples from the hottom of the incline yesterday were as follows: $289.39, $383.82, $173.53, $126 18, making an average of $243.23. The average for the face of the crosscut near the 2100 level was $292.42. We were shown assays that went as high as $500 to $800, and one that went over $1,600, and heard of some that were even higher, the samples heing, of course, selected.

LADY BRYAN.—On Sunday morniug last the entire hoisting works of this mine, along with some 300 cords of wood, the blacksmith aud carpenter sbop, aud a large amount of winter supplies were destroyed by fire. All will he put in shape for a resumption of operations as soon as men aud money can he made to do the work.

JUSTICE.—On the 1300 level, in winze No. 1, good progress is heing made, sinking in favorahle ground with spots of ore. Nos. 4 and 5 crosscuts east and south, lateral drift, 1300 level, are all in quartz showiug some ore. West crosscut, 1400 level, is passing through a mixture of quartz and bird's-eye porphyry, and in this crosscut shows the ledge to be growing in width very much as depth is attained. On the 1150 and 1225 levels, drifts are heing run through north ore chimney preparatory to stoping ore, and extracting at present a few tons of ore per day of first-class quality.

UNION CON.—The progress of work on the 1600 level has heen somewhat interfered with by a flow of water struck in the drift, which is heing driven east on the 1600 level. The finding of this water and the soft ground in which it occurred may lead to something of interest in that direction.

BELCHER.—The joint cast crosscut from the bottom of the incline on the 2360 level has reached and penetrated into the quartz vein, which, although looking well, shows nothing of value. East crosscut No. 1 on this level is still in quartz and porphyry of a favorahle character.

CROWN POINT.—The joint east crosscut on the 2300 level is making good progress, the face in a fine character of quartz and vein matter.

NORTH CON. VIRGINIA.—The pits for the stone foundations for the new machinery are about finished, ready to hegin the mason work. Sinking the main shaft is progressiug at the rate of 2 feet per day.

OVERMAN.—The east drift from the 1600 station of the old shaft will he in condition to start a drift north on the ore vein in a day or two more.

TROJAN.—The car samples of ore extracted during the week average $38 per ton. The east crosscut from the south drift on the fourth station level is in 40 feet, the face in favorable quartz. The south drift from the top of the upraise, No. 3, on this level is advancing through fair ore. The west crosscut, 400 feet south of the fourth station, is steadily advancing through quartz and vein matter.

HALE & NORCROSS.—The pumps and all the machinery are working well and smoothly.

JULIA CON.—The flow of water from the 2000 level has greatly decreased, and is now handled with great ease by the pumps. The main south drift on the 2000 level is being pushed vigorously forward, the face following the east clay wall of the ore vein. East crosscut No. 2 is making good progress, the face in lively vein matter.

BENTON CON.—The north drift on the 1250 level is steadily advancing toward the north line, and will soon have the entire length of the vein laid hare on that level ready to hegin crosscutting. The north lateral drift on the 1350 level is also making good headway, the face in favorable vein matter.

BRILLIANT.—Grading of the new shaft and grounds for hoisting works, and the road to the Overman road from Virginia, are finished, and the road to connect with Alta road is nearly completed, and in a few days will commence sinking the new shaft.

GOULD & CURRY.—The joint east crosscut from the joint Savage winze, on the 1900 level, is steadily advancing, the face iu favorahle vein matter.

NEW YORK.—The north and south drifts running parallel with the ore vein on the 1100 level are beiug advanced at the usual rapid rate of speed, the face of each in easy working vein porphyry carrying occasional streaks of excellent quartz.

BEST & BELCHER.—The joint east drift on the 1900 level is still advancing in veiu matter.

ALTA.—Sinking the winze on the ore body below the 1450 level is making good headway, the hottom still in quartz and ore of a good quality. The east drift on the 1550 level is entering excellent quartz, carrying some good ore.

YELLOW JACKET.—The machinery is all right again, aud rapid progress will he made hereafter in sinking. The west crosscut from the main south drift is in 98 feet; face in a mixture of porphyry and quartz.

CON. DORADO.—Sinking the new working shaft is making excellent progress, being in very favorable working ledge material, showing frequent streaks of good-looking quartz.

SAVAGE.—The east crosscut should soon reach the hody of quartz in which low grade ore was found on the 1600 level. It was almost a "milling propositiou" on the 1600 level and should certainly be found to have improved to a considerable extent at a further depth of 500 feet. Sinking the north winze below the 2000 level is making good headway, the bottom in vein matter.

NORTH BONANZA AND FLOWERY.—Sinking below that point will be continued with all the speed possihle. The old North Bonanza incline and tuunel, 300 feet to the northward of the main shaft, where so much rich ore has heen from time to time taken out, is heing put in working order preparatory to the steady extraction of ore.

ATLANTIC CON.—Uuder new ownership and management this old mine helow Silver City is beiug reopened in first-class shape and its practical workiug aud development will he resumed under more favorahle auspices than ever. John Yule, the new Superiutendeut, is a good mining man of much practical experience and unbounded energy.

SUTRO TUNNEL.—The main south hranch toward the Julia shaft is pushing ahead at a lively rate in regular Comstock vein matter.

BULLION.—The 2050 station in the main incline is opened and a drift started to crosscut and prospect the ore vein at that point. The prospects at that point are very encouraging.

CALEDONIA.—The north drift on the 1600 level is being driven steadily forward, the face in vein matter of a very favorable character.

LEVIATHAN.—The lateral drifts hoth north and south on the 750 level, following the foot wall, continue pushing ahead at a good rate of advancement, with good streaks and feeders of ore constantly encountered, especially in the north drift.

CHOLLAR-COMBINATION SHAFT.—The north drift on the 1600 level will connect with the Sutro tunnel in a day or two more.

ALPHA CON.—The west crosscut on the 2400 level is steadily advaucing, the face in quartz and low grade ore.

GOLDEN PRIZE.—The open cut or upper stope, at the surface of the north vein, shows a fine face of pay ore.

MORNING STAR.—The repairs to the main tunnel will soon be completed to the face ready to begin the crosscutting and prospecting of the ore vein.

CON. SUPERIOR.—The repairs to the main tunnel running to drain the ore vein are making the hest of progress.

CON. IMPERIAL.—Sinking the south incline winze below the 2400 level is making the best of progress, the hottom in quartz affording favorahle assays. The west crosscut on the 2400 level still shows a fine character of quartz in the face.

SILVER HILL.—The east drift on the 900 level is showing some very favorable ore indications. The St. Louis drift and the east crosscut on the 800 level are each steadily advancing in very favorable ground.

SUCCOR.—Nothing has heen done in the mine during the past week owing to the breakage of the large spur wheel of the pumping engine. A new spur wheel cast at the Gold Hill foundry, will be ready for use in a few days.

IMMENSE DISCOVERY.—Reno *State Journal*, Oct. 12: The news from the Loonis mine, five or six miles north of Reuo, is most encouraging: A shaft was sunk at the uorth end of the ledge and a good ledge unearthed, which assayed from $20 to $500. Another shaft was sunk 1,000 feet of this and some good ore struck. Determining to examine still further they went 1,000 feet south again and sunk another shaft, and again the ledge appeared. Elated at their wonderfully good find they went to a point 1,000 feet east of the line of the above shafts only to find the ledge there as good as at the other points. Then ahout 1,000 feet west are croppings which are valuahle. An expert was sent up by San Francisco stockholders to examine the mine, and he has gone back with a most glowing report. He made a close inspection of the various shafts, examined critically the surrounding country and asserts that a great discovery has heen made. T. V. Julien, the Superintendent of the Loomis, is enthusiastic over the good ledge and its remarkable extent. The theory is advanced that the whole mountain is one vast ore body. Judging from the extent we think the theory cannot be far from correct.

PARADISE DISTRICT.

YIELDING.—*Silver State*, Oct. 12: The whole of Silver hill, upon which is situated the most of the mines, seems to he a mass of untold wealth. Mines heretofore thought to he harren are yielding rich ore. The Alpine, a recent location, is now yielding some remarkahly rich ore. The White Bell company have found a rich streak. The Wild Goose has some excellent ore on the dump, while the Paradise M. Co. are getting out richer ore (if that can he) than ever. The Rocky Point mine has struck fine ore, which would work, perhaps, $160 to $200 per ton. The Red Deer Co. are about leasing or bonding their mine to some outside parties.

UTAH.

BUTTE MINE.—Salt Lake *Tribune*, Oct. 11: Ten tons of ore from the Butte mine, in Big Cottonwood, was sampled yesterday in three lots. The first class went 300 ounces of silver to the ton; the second, 120 ounces; and the third, 40 ounces. The Butte mine, which is now heing worked hy Messrs. Hall & Clark, is looking very well, and promises to show up a fine body of ore.

News in Brief.

TURKEY is fast fixing up with Crete.

LOCUSTS are ravaging Japan rice plants.

FINE grapes were grown this season at Silver City, Nevada.

TERRIFIC storm along the Massachusetts coast on October 12th.

CALIFORNIA salmon eggs are shipped at times to Europe.

THE United States have an average of over 180 fires per day.

EBENSBURG, Pa., is almost completely in ashes. Loss between $350,000 and $400,000.

PREMATURE fishing in September destroyed millions of prospective salmon.

PRESIDENT HAYES has recognized the independence of Roumania.

NOW comes the news that Turkey is again on the most friendly terms with Russia.

SIT MING COOK, the Chinese consul at San Francisco, has entered Hastings' law college.

TWO consecutive dry seasous have, it is thought, caused the dying of pine trees noticed now in Arizona.

SPAIN does not like the growth of English influence in Morocco. She may possibly pick a quarrel.

A DEPRESSION in trade, exceeding anything experienced in 75 years, prevails in the West Indian islands.

THE Puget sound white potato crop is said to he a partial failure. Season too dry except in low or hottom lands.

A LITTLE boy in Nevada county drank concentrated lye, supposing it to he milk. He died in dreadful suffering.

A FIRE near Moscow destroyed 23 stone houses, 31 wooden houses, and 70 warehouses, valued at about $1,600,000.

HEAVY and continuous floods are devastating the lower countries of Japan. Seven villages are reported entirely submerged.

THE wagon and agricultural implement dealers report business more active than they ever before knew it in their line in Utah.

AN immense numher of hogus coins are circulating in Idaho. The are made of hlock tin, hismuth and powdered glass.

THERE were 696 deaths from cholera at Casa Blanca, Morocco, hetween the 7th and 24th of Septemher. The epidemic is now decreasing.

JOHN BIDWELL, of Chico, has received an order from the Agricultural Department at Washington for 100 hushels of harley for distribution.

THE numher of standard silver dollars coined to date is ahout 17,000,000, and it is not helieved there are more than 2,000,000 in actual circulation.

THE attempt to estahlish direct communication hetween San Francisco via the Colorado river and Fort Yuma is ahandoned for the present.

SWIFT county, Minnesota, has had a hig prairie fire. Many farms, with houses, barns, cattle and grain were destroyed. Many farmers are destitute.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING OCTOBER 1ST, 1878.

AMALGAMATORS.—Charles P. Bowen, Silver City, Idaho Ter.

HOPPERS FOR CUBE SUGAR MACHINES.—Wm. Jasper and Stephen Boushey, San Francisco.

MACHINERY FOR MAKING CUBE SUGAR MACHINES.—William Jasper, San Francisco.

LASTS.—Joseph E. Chenette, Hillsborough, Ogn.

APPARATUS FOR SAVING FLOAT GOLD.—Julius J. Muller, San Francisco.

LIFE BOATS.—Charles Dickenson, Portland, Ogn.

SUCTION PIPES FOR PUMPS.—Eric O. Leermo, Gold Hill, Nev.

PENCIL CLASPS.—Wm. A. Scollay, San Francisco.

MEDICINAL PREPARATIONS.—Trademark—Mathew Palen, San Bernardino, Cal

MEDICINAL PREPARATIONS.—Trademark—Channing White, San Francisco.

COUGH SYRUP.—Trademark—Williams & Moore, Stockton, Cal.

ILLUMINATING OILS.—Trademark—Yates & Co., (2) San Francisco.

CIGARS.—Trademark—Liebes Bros. & Co., San Francisco.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR SAVING FLOAT GOLD.—Julius J. Muller, San Francisco.—Dated October 1st, 1878. This apparatus is intended for saving the fine particles of gold which are found in suspension in the water from gravel or placer mines or quartz mills. It consists in placing on a frame in a tauk a series of hlankets so arranged as to fill the upper portion of the tank, and leading the water containing the float gold into the tank *under* the hlankets, so it rises through the hlankets, which allow the water to pass through hut catch the gold. Suitable devices are employed to retain the hlankets in position firmly. The supply trough, into which the water is led, is connected with the tank by telescopic pipes which admit of it heing raised or lowered to regulate the pressure or head without having to connect or disconnect said pipes. The whole frame carrying the hlankets may he removed from the tauk when it is desired to clean the blankets. It is well known to miners that large quantities of gold in a finely disseminated condition escape with the water used in working the ore or gravel. This is technically termed float gold. Various devices have been arranged for preventing this loss, hut most of them have failed in attempting to hring the float gold in contact with mercury. With the device above described, the water heing closely confined and having to rise up through the hlankets to escape, is quieted, as it were, and the hlankets resist the passage of even the finest particles of gold. The water is not led into the device until it is comparatively free from mud or dirt, so that only a small quantity of debris will remain in the tank, and can easily be removed. The object of the apparatus is to pass large quantities of water which carry but a limited quantity of sediment and some float gold through the blankets, thereby effecting such a concentration of the material and fine gold that the latter may he easily separated and saved.

AMALGAMATOR.—Charles P. Bowen, Silver City, Idaho.—Dated October 1st, 1878. This is an improvement in that class of amalgamators in whicb the ore is forced into a body of mercury by mechanical means, so as to he thoroughly stirred up with the mercury. It consists in the use of a receptacle for the mercury, in the center of which is an open-hottomed tuhe or cylinder in which a screw revolves, so that when the pulp is forced into the top of the cylinder the screw will force or draw the pulp down through the mercury, discharge it through the hottom of the tube into the mass of mercury, where it rises to the top. Water is admitted around the vessel containing the mercury, which keeps the pulp stirred up and flows it over the edge of the vessel into a tank, whence it is drawn off to the settlers. It also consists in forming openings in the central tuhe or cylinder just below the surface of the mercury in the vessel, so that the action of the screw will draw fresh mercury from the vessel into the tuhe and mix it thoroughly with the pulp, and so keep up a continuous downward current of fresh mercury and pulp through the tuhe or cylinder on which the screw operates. In this way all the particles of precious metal are brought in direct contact with the mercury and amalgamated hy the action of the screw, while stirring and mixing the pulp and mercury is not sufficiently rapid to "flow" the quicksilver. The operation of this device is continuous, and it can he employed in connection with seve-

ral settlers. The mercury is always bright and in a condition to perform its office, which is not the case where it is distributed over a copper surface exposed to the air.

WATER HEATING AND ELEVATING ATTACHMENT FOR STOVES.—L. H. Lawrence, Montecello, Napa county, California, and Alfred Strawbridge, Sharon, Pennsylvania. The improvement consists in attaching to a stove a chamber enclosing a valve for directing the heat either up its stove pipe in the usual way or through a flue into a cylinder which connects with its stove pipe at a point some distance above the stove. Under this cylinder is placed a tank, having a pipe and faucet at its top and projecting through the cylinder, and at the bottom is another pipe connecting with a tube leading to the well, cistern, or other reservoirs. By directing the heat into the cylinder and around the tank, the air in the tank is exhausted and driven out. By turning the hot draft out of the cylinder and up its stove pipe, and admitting cold air around the tank under the cylinder, a partial vacuum is formed in the tank. Then the power of the vacuum will draw the water up into the tank from the well or cistern, through a check valve in a tube. When the tank is filled, the heat may be turned into the cylinder again and the water in the tank heated for household purposes. By the means described, an arrangement is provided which draws the water up from a reservoir, well, or cistern into a tank, and heats it, all being accomplished by means of the ordinary waste heat from a stove.

IMPROVEMENT IN LASTS.—Joseph E. Chenette, Hillsborough, Washington county, Oregon.—Dated October 1st, 1878. This invention relates to certain improvements in lasts, such as are employed in the construction of boots and shoes, and it consists in a novel method of screwing and locking the front part of the last to the rear or main portion. A novel means is adopted for nailing the sole of the boot or shoe to the last, so that the last shall not become perforated by nail holes, and so that a perpetually renewed surface shall be provided for the reception of the nails.

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

MODEL MAKER AND MACHINIST.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Keystone Quartz Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Sierra county, California

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No 6) levied on the thirtieth day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Carolan, James, Trustee	59	200	100 00
Hall & Charles, Trustees	68	1248	624 00

And in accordance with law, and an order of the Board of Directors, made on the thirtieth day of August, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, No 201 Sansome street, corner of Pine, San Francisco, California, on the twenty-eighth day of October, 1878, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, No. 201 Sansome street, corner of Pine, San Francisco, California.

New Basel Gold Mining Company.—Principal place of business, 610 Merchant street, San Francisco. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of September, 1878, an assessment of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 18th day of November, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. D. F. LEGAYE, Sec'y.

Office 610 Merchant street, San Francisco, Cal.

Orion Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the fifth day of September, 1878, an assessment (No. 3,) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 28 Sansome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of November, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 20th day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

P. CONKLIN, Sec'y.

Office, No. 28 Sansome Street (up stairs), San Francisco, Cal.

Pocahontas Mining Company.—Location of principal place of business, 411½ California street, San Francisco, California. Location of Works, El Dorado County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 14) levied on the 14th day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Directors made on the 14th day of August, 1878, so many shares as may be necessary of each parcel of such stock will be sold at public auction at the office of the Company, Room 9, 411½ California street, San Francisco, Cal., on Wednesday, the twenty-third day of October, 1878, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

M. C. SOUTHARD, Sec'y.

Office, Room 9, No. 411½ California street, San Francisco, California.

Summit Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the tenth day of September, A. D., 1878, an assessment, (No. 5,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the twenty-second day of October, A. D., 1878, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on the 23rd second day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

The California Fruit Growing Association.—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three (3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the California Fruit Growing Association, held September 23d, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till Saturday, the 26th day of October, 1878, and the day of sale of delinquent stock is hereby postponed to Friday, the 22d day of November, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco.

Vigorit Powder Company.—Location of principal place of business, City and County of San Francisco, California. Location of works, California City, Marin County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No 1) levied on the first day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. Shares	Amount
Louis McLane, Trustee	30	437½	$218 75
Louis McLane, Trustee	32	½ of 875	218 75
G W Grayson, Trustee	62	1312½	656 25
H H Shinn, Trustee	91	400	200 00

$1 FOR 25 CTS.

Seven new and wonderful articles at one-fourth retail price. Examine the list.

No. 1. Musical Pipe.—Made of metal, with bowl resembling a human face. By filling with water, will imitate perfectly the notes of any bird.

No. 2. Miniature Charm.—Suitable for necklace or watch chain. Size of gold dollar, yet has all of Lord's Prayer clearly engraved on it. New and beautiful. A perfect little gem.

No. 3. Eureka Whistle.—Loudest and cleverest whistle made. Very useful for sportsmen to exchange signals at long distances.

No. 4. Japanese Parasol.—Just imported. Prettiest bijou novelty in the market. Finished in beautiful colors. Splendid gift to a lady.

No. 5. Magic Spider.—Funniest thing out. A horrible looking fellow, sure to make people jump out of their boots. Always creates an excitement.

No. 6. Musical Wonder.—A new mechanical instrument, on which any tune may be played, or sound imitated, from the wail of a cat to a Punch and Judy show. Pleases everybody.

No. 7. Golden Water-Pen. Produces clear, golden letters, by simply dipping in water. Lasts for months. Unrivaled for card writing.

The above seven articles are shown in one, and will be sent in neat cabinet, post-paid, for 25 cts. At retail they would cost $1. We make this reduction to obtain new names for our Full Catalogues. Postage stamps taken same as cash. Address,

Eureka Trick and Novelty Co.,
P.O. Box 4514. 39 Ann St., N. Y.

This advertisement will not appear again.

WATER TANKS of any capacity made entirely by machinery. Materials the best in use; construction excelled. Pan Staves, Tubs and Oak Guides for mining purposes a specialty.

WELLS, RUSSELL & CO.,
Mechanics' Mills, Cor. Mission and Fremont Streets.

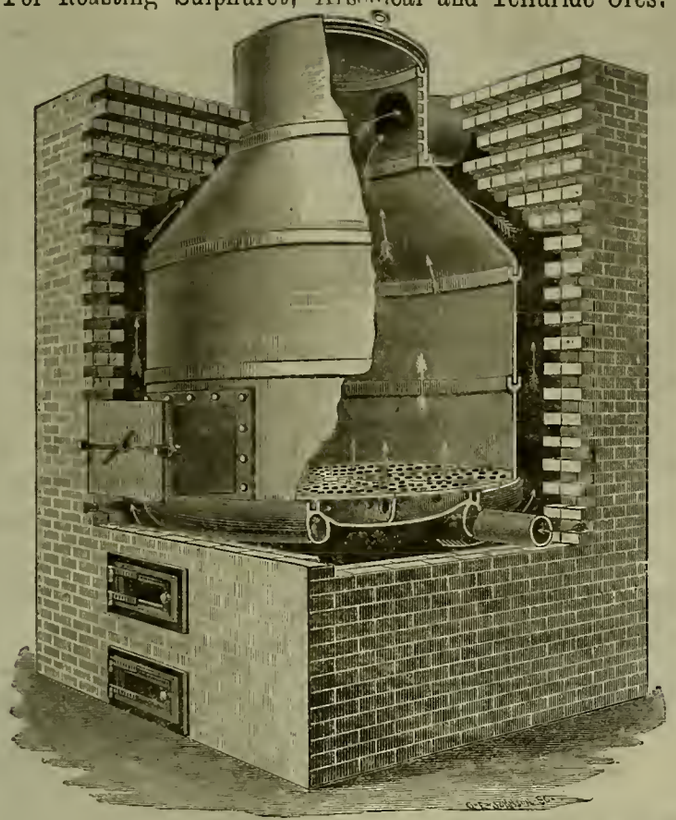
Z. A. WILLARD'S AUTOMATIC FURNACE

For Roasting Sulphuret, Arsenical and Telluride Ores.



The attention of scientific and practical men is called to Z. A. Willard's new method of treating sulphuret ores.

This process has been tried and tested on a large scale in Boston and in Colorado on every variety of ore, including sulphurets of iron, copper, lead and antimony, and arsenical and telluride ores of high and low grade, and in all cases with the most complete success.

The advantages claimed for the Furnace are: Perfect adaptation to the process. Simplicity and ease of construction. Cheapness—caused by shortness of time required in roasting, small amount of fuel needed, dispensing with skilled labor, and by the low cost and durability of the furnaces. Durability—the low heat used not injuring either iron or brick work. Economy of fuel—the amount used not exceeding one cord of wood to ten tons of ore. Economy of labor—no skilled labor, and very little labor of any kind, its automatic action only requiring one man to six furnaces. Perfect nature of roast—by which all the sulphur is burned away, the base metals oxidized and the precious metals set free. Ability, by reason of the perfect nature of the roast, to use chlorination (Plattner's method) for saving the gold in strictly gold ores. No loss by dust or volatilization.

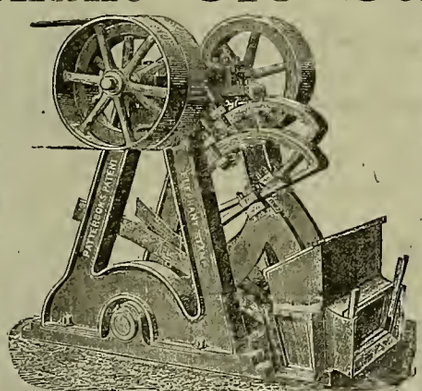
The cheapness and simplicity of this process renders it of vast importance in solving the question of the profitable reduction of low grade refractory ores.

Z. A. WILLARD, Patentee,

Baldwin's Hotel, Market St.,

SAN FRANCISCO.

Elephant Ore Stamp.



We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco For particulars, apply to

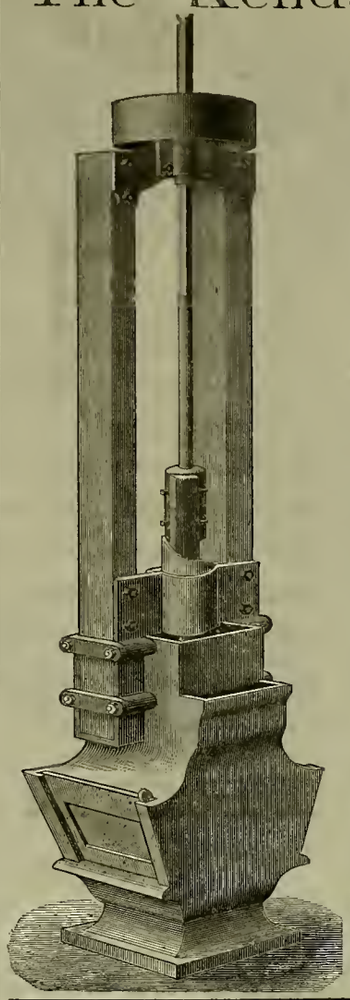
EDMUND WHITE, Care of A. B. Grogan, 705 Sansome St.

GOLD, SILVER AND COPPER MINING,
Reducing and Concentration Machinery.

Hoisting Engines, Diamond Pointed Rock Drills,
Manufactured by M. C. BULLOCK.

Address, FRASER, CHALMERS & CO., Chicago, Ill.

The Kendall Battery.



STEPHEN KENDALL, Patentee.

This Battery embraces the only genuine improvement that has ever been made in the process of reducing ores. The frame is all secured to the mortar, so that no extra framework is required. The stamp is rotated by a horizontal pulley on the top of the frame, and raised by the cam which is set horizontally on the girt timber. The upper end of the stem is made square, and works up through the pulley. When the stamp falls it crushes and grinds the ore fine by the continual rotary motion. The mortar has three discharge openings, and is adapted to either wet or dry crushing. A mill with an 800-pound stamp will crush five tons of average ore per day, shipping weight, 4,000 lbs., and requires about five horse-power. A 1,600 lb. stamp mill is in process of construction, which will give a capacity equal to any five-stamp mill. Several of them are now in successful operation in various parts of the country. For PROSPECTING PURPOSES this mill has no equal, as it can be set up and moved with such facility and operated at so small an expense. Address for further information,

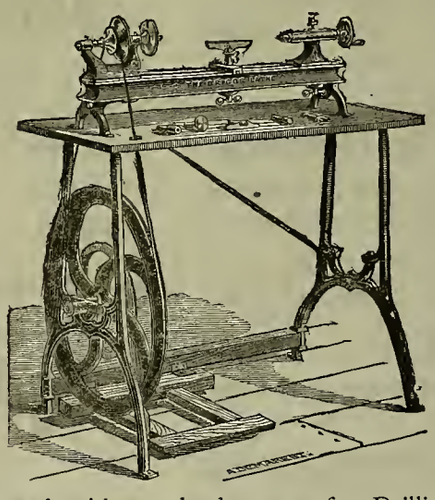
Rankin, Brayton & Co.,

MANUFACTURERS,

Pacific Iron Works. San Francisco.

THE BRIGGS LATHE.

Combines Superior Excellence in Quality and Finish with Beauty, Strength and Completeness.



This Lathe will turn a piece of Wood or Metal 12 inches long and 6 inches in diameter.

It can be used with equal advantage for Drilling, Polishing, Sawing, etc. The length of bed is 24 inches; the spindle is made of steel, has a conical bearing, and can be tightened as it wears. The bed, head, tail-stocks and cone-pulley are of cast iron and the centers of steel. The following pieces are furnished with the lathe: 2 T rests, 1 face-plate, 2 plain centers, 1 spur ce ter for wood, 1 plain drill-chuck, 1 drill-pad, and 1 center left blank to turn down as a fitting for a universal chuck. The bench weighs 81 pounds, is made of iron, with a black walnut top, and has a driving-wheel measuring 22 inches in diameter, with three grooves for changes of speed.

PRICE OF LATHE, AS ABOVE, $25.

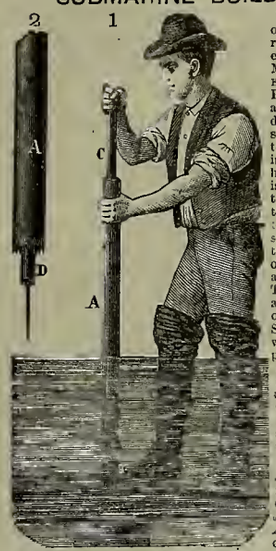
Important to Contractors

— AND —

SUBMARINE BUILDERS.



WILLIAM STACK, of Oakland, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an apparatus for driving nails or spikes under water, an engraving of which is here shown. It is well-known that it is extremely difficult to drive nails or spikes under water, even if it is only submerged a few inches. These difficulties are completely obviated by Mr. Stack's device, which has been put in thorough practical operation in the construction of wharves and lips in the Oakland side of the bay.

Fig. 1 shows the application of the device, and Fig. 2 snows the construction. *A* is a metal tube of suitable length, the foot of which may be serrated as shown, so that the points will engage with the wood when the tube is pushed or driven against it. The rod or driver, *C*, has a recess or cavity, *D*, at the lower end so as to rest on top of the nail or spike shown in Fig. 2. Where the tube, *A*, is pushed against the timber in the desired position, the spike or nail is dropped in at the upper end and slides down against the timber. The rod, C, is then slid down on top of the nail, and by alternately drawing out and forcing the rod into the tube, the rod serves as a driver; or by hammering on the upper end of the rod the nail is driven into the wood. The tube answers both as a guide for the nail and driving rod. The tube can also answer as a guide for a screw-driving device on the end of the rod, by which lag screws may be put in place under water as well as nails. Of course the tube may be set in any position desired, so that nails may be driven at an angle if necessary. The appliance, as simple as it is, will be found very useful in many cases for bridge building or similar purposes. Address,

WM. STACK,

N. E Cor. Fifth and Harrison Sts., OAKLAND, Alameda County, California.

Mines and Work of Almaden.—No. 6.

[Translated for the Press from "Annales des Mines."]

Fifth level; depth, 170.47 meters—Fig. 9. The vein San Diego has in its eastern part a uniform direction north, 110° east for a distance of 50 meters or thereabouts. Its mean thickness is 4.40 meters. Its walls are formed of great hanks of white quartzite, nearly vertical and completely harren.

Its western extremity is encased in schiste; it changes direction rapidly towards tho south, tho hanks of schiste and sandstone have snffered the same dsviation. This part of the vein to the south should have received the name of San Pedro; it is in effect nothing hut a prolongation above of the vein which lower down bears this name, hut on account of its considerable width and the importance which the works in it had for a considerahle time, the special name of Santa Clara has been given to it. The length of this deposit is only 25 meters; its thickness ahout 7.80 meters. The beds of schiste surround those of the sandstone of Santa Clara, and seem to be molded upon them, while the stratification of the schistc does not seem to be in accord with that of the sandstone.

Separated from the San Diego by a sterile interval of ahout 25 to 30 meters to the east, 18 to 20 meters to the west, half of schiste, half of quartzite, the San Francisco vein extends with great regularity in the direction north, 110° east, parallel to that of San Diego, for 100 meters of distance, with an average thickness of 3.90 meters. Towards the point where it is crosscut hy the shaft San Teodoro, it inclines to the south, and then disappears all at once; the ore is throwu out hy a fault for six meters to tne uorth, while the heds of quartzite do not participate in this faultiug. This part of the veiu, to which has always heen given the name of West San Francisco, forms an arc whose concavity, as also that of the encasing beds and of San Diego vein, is turned to the southeast.

Tne most northern vein, that of San Nicholas, only exists to the west of the mine; it is separated from San Francisco hy six meters of schiste, and extends for 30 meters in length, with a mean thickness of 2.90 meters.

Some crosscuts for prospecting, commenced on this level, have been promptly ahandoned after driving 20 to 30 meters in the schiste, without result. Besides, no other hanks of quartzite are seen upon the surface in the immediate vicinity of those which are impregnated with cinnahar. These researches were therefore undertaken more to prove the ahsence of these hanks than in the hopes of finding new deposits.

Sixth level; depth, 191 meters—Fig. 10. From the 5th to the 6th level, the heds pitch to the north, making with the vertical an angle of about 20°. As in the preceding level, the veiu of San Diego has in its eastern part a great regularity. It follows for 80 meters in length the direction N. 110° E., with a mean thickness of 5 meters; its walls are formed of quartzite to the east, then half of schiste to the west. It is inflected afterwards; under the name of Santa Clara, in the direction of uorth of south (*Nord-Sud*), which is continued for a distance of 25 meters, with a great width of 13 meters. The two walls of Santa Clara are formed of schistes; but to the south this deposit hccomes suddenly sterile, and the quartzite which constitute it abuts against the frailesca.

The veiu of San Francisco is separatod from tbe preceding hy 20 meters nearly of sterile rock, a part schistose, hut chiefly formed of quartz, etc. This rock is deflected the same as the Santa Clara, and then loses itself in the schistes. Those latter, resting upon the frailesca, which limits them to the west, advance towards the north and cut the cinnahar-bearing sandstone of San Francisco and of San Nicholas, as well as those which separate the two uorth veins from the one to the south.

The San Francisco vein is at this level of a great regularity; it extends for 110 meters, with a width of about 5 meters; it is deflected but slightly to the south at its western extremity. It is separated from the San Nicholas by only 3 to 6 meters of qnartzite and of schistes. This latter vein gains likewise in regularity, and in extension very much. It attains a length of 65 meters, with a width of 3.25 meters. It is bounded on the north by schistes.

One remarks at this level, at the eastern extremity of the San Francisco vein, a small mass of rock of the family of the melaphyres, very much altered; we have already indicated the relation of this porphyry (variety *d*), with the advent of the cinnabar.

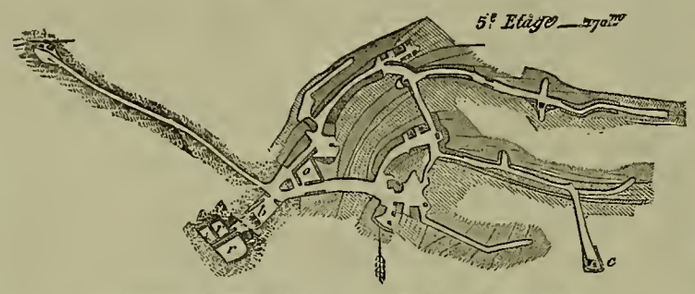

FIG. 9. FIFTH LEVEL OF THE ALMADEN MINE.

Seventh level; depth, 215 meters—Fig. 11. Below the 6th level the deposits become nearly vertical, take a regnlarity more and more great, as is well shown in the plan just referred to of the 7th level.

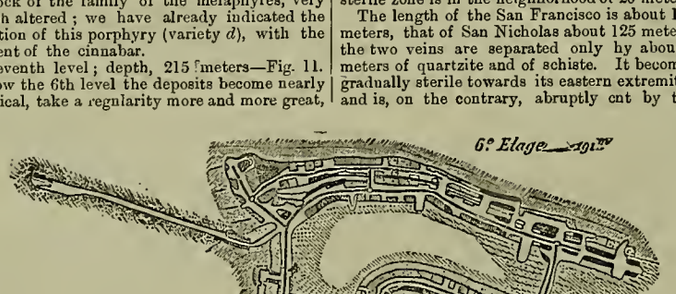

FIG. 10. SIXTH LEVEL OF THE ALMADEN MINE.

Resting to the south upon the frailesca, the schiste forms the two walls of the San Diego vein, which here commences to bear tho name of Pedro y San Diego, the first designating specially the western part, the second the eastern part of the vein. The vein attains here a length of 150 meters; the mean thickness is from 6 to 7 meters. To the east the San Diego is abruptly cnt hy the heds of schistes which turn in such a mannor as to he nearly normal to those of the sandstone. This fact is the more remarkable, as this is the only point in the mine where the vein is abruptly cut by the east; in all the other levels it becomes gradually poorer until it passes into a sandstone nearly sterile. To the west, on the contrary, the vein of the San Pedro diminishes gradually, and finishes by disappearing entirely among the schistes, but without ceasing to be in concordance with their stratifications.

The rocks which separate San Pedro y San Diego from San Francisco are just a narrow strip of schistes, then a series of alternating beds of quartzite and of schiste, in which the quartzite predominates. The width of this sterile zone is in the neighhorhood ot 20 meters.

The length of the San Francisco is about 155 meters, that of San Nicholas about 125 meters; the two veins are separated only hy about 3 meters of quartzite and of schiste. It becomes gradually sterile towards its eastern extremity, and is, on the contrary, abruptly cnt by the schistes to the west.

It is between the 6tb and 7tb levels tbat the great deflection of the vein, San Pedro y San Diego, towards the south begins. San Pedro rises first vertically for 10 meters, then it suddenly widens, inclines from the vertical, and forms the agglomeration designated under the name of Santa Clara. It is evident that a strong lateral pressure, acting from north to south, has deformed the upper levels at an epoch possibly after the advent of the cinnahar, which we naturally suppose to have hcen made hy a fissure nearly vertical.

FIG. 11. SEVENTH LEVEL OF THE ALMADEN MINE.

[To be Continued.]

An inundation in the valley of the Bormeda, in Piedmont, swept away houses and bridges and reduced many families to utter destitution.

Improved Pulley for Wire-Rope Tramways.

In wire ropeways, or tramways, great difficulty has always been found in changing the direction of the rope from a straight line, and various devices have heen attempted to overcome tho difficulty. On ropeways, when buckets are attached to the cable, which have to pass around the main pulleys at the ends, devices have been nsed, which are attached to each separate bucket, adding weight, increasing friction and expense, and liability of hreakage on tramways, where clutches or grips are attached to the cable from the car or dummy above, it has heen necessary to detach the grip or clntch from the cahle altogether when the direction of the rope has been changed from a straight line—no practical method having been fonnd of getting the grips past the horizontal pulleys, necessary to change the direction of tbe cahle. Dr. A. Blatchley, of Kernville, Kern county, has recently patented through the Mining and Scientific Press Patent Agency, a device which is intended to obviate these difficulties, and change the direction of a line of cahle, at right angles if necessary, without having to detach grips, clutches or huckets, or without separate attachments being added to the grips or buckets—the whole object heing accomplished hy the peculiar construction and operation of the pulleys at the ends or corners of the lines.

The arrangement consists in mounting a grooved pulley, so as to revolve on a horizontal plane, and placing on it a supplemental pulley, the edge of which is in a line with the perphery of tbe main pulley. Over this is secured a plate, so constructed as to engage with a catch at a certain point, and stops the revolution of the main pulley, so that the friction of the cable is taken on the small supplemental pulley, which revolves as the main pulley is stopped by the plate engaging with the lug. Back of the plate is cut in the edge of the main pulley a peculiarly shaped slot, into which projects the forked arm of a bell-crank lever, operating a cam, on top of the plate, in such a manner that when a hucket, clutch or other obstacle on the cahle catches in the forked arm of the lever, said lever operates the cam so as to press back the catcb and allow the main pulley to revolve. The bucket or clutch then hangs in the slot as the main pulley revolves, not coming in contact with it, so that it passes hy without interference. After it passes, the main pulley revolves until the plate engages with the lug, when the rope plays in the supplemental pulley, until the next projection or attachment on the cahle operates the device as hefore.

A Query.—"A Constant Reader" writes from Amador City, asking the number of hoard feet in a stick of square timber, the ends of which are respectively 4x4 and 8x8 inches, and the length 22 feet. Multiply 4×4 by 8×8; extract the square root of the product; add the result to the sum of 4×4 and 8×8; multiply the result by one-third the length in feet; divide the product by 12, and the result will he the number of board feet in the stock. Thus: 8×8×4×4=1,024; the square root of 1,024 is 32; 8×8×4×4×32=112; 112×22.3=821.33; 821.33÷12=68.44 feet, hoard measure.

The Pemberton mining company has organized by electing the following officers: J. D. Gray, President; A. C. Hiester, Vice-President; Pacific Bank Treasurer; T. A. McGee, Secretary; J. T. Pemberton, Superintendent; J. D. Gray, A. C. Hiester, August Drucker, Edward S. Solomon, W. B. Murdoch, Trustees. The company own two miles in Fresno county. The quartz from which is free milling, and yields from $28 to $35 in gold per ton, one of the ledges having a vein of pay rock from 18 inches to four feet in width within 25 feet of the surface.

The steamer *Dominion*, Montreal to Liverpool, lost overhoard in heavy weather 514 sheep. The *Victoria*, from Boston, lost 100 cattle.

It is expected that the second dividend of 15% will he paid to the depositors of the Farmers' & Mechanics' Bank early in December.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Carson City, Nevada.—No. 2.

[From our Traveling Correspondent.]

The Virginia and Truckee Railroad

Is justly regarded as one of the grandest successes of modern engineering and railroad building. It was finished in the fall of 1872 from Reno to Virginia City, a distance of 52 miles, at a cost of $100,000 per mile, or a total cost of $5,200,000. The road passes through Truckee meadows, Washoe valley, Eagle valley, where Carson City is situated, down the Carson river a distance of six or seven miles, and then takes to the hills where it does some of the tallest mountain climbing until it lands at Virginia, the great city on the Comstock. Some idea of the amount of business done may be had by a knowledge of the fact that 30 trains pass over the road daily. Among the items of daily freight is about 600 cords of wood necessary for daily consumption in the mills and hoisting works of the Comstock. The company has at Carson a mammoth railroad building of stone and iron, used for a machine shop, roundhouse, foundry and car manufactory. The average number of employes of this road is 350. The company are now making arrangements to extend their road to Mason valley, Aurora and Bodie.

The Little Girl's Band.

One of the most novel and pleasing attractions of this exceedingly pleasant and attractive little city, is a band of musicians composed principally of little girls, or very young ladies, ranging from 10 to 16 years of age—citizens, and some of them natives of Carson. Mr. C. A. Marston, of this city, aided by Mrs. Marston, organized and instructed their youthful pupils in the science of music, arranged their pieces and taught them to play with such perfection that they now render some excellent classic music in a style that would do credit to older heads with more extensive training. It has generally been thought that it required an immense pair of lungs and great physical strength to blow a brass horn successfully, but that delusion is dispelled when you see a little girl blowing a horn that she could almost crawl into, with as much force or at least making as much noise as one of Gilbert's broad-chested Teutons. Their uniform is very pleasing. It consists of a gray sacque and kilt skirt of the same color, trimmed with maroon velvet ribbons or band across the breast, *a la militaire*, cuffs of the same with gold fringe, pockets of same, gold fringe, lower edge of sacque the same with gold fringe. The headdress is a helmet trimmed with gold ornaments and a white feather. The combination is very pleasing without being gaudy. The troupe consists of 11 pieces, under the leadership of Peter Spargo, and is composed of the following persons: C. A. Marston, Mrs. C. A. Marston, Peter Spargo, Mamie St. Clair, Laura Farrell, Ella Farrell, Lena Marston, Ida Marston, Annie Marks, Alice Farrell and Hattie Marks.

Cashmere Goats.

There is, perhaps, no place on the Pacific slope better adapted to the breeding and development of the Cashmere goat than in this valley and the foothills and mountain sides surrounding this basin. The climate is better adapted to that industry than California on account of the prevailing cool weather during a greater portion of the season. This theory is well demonstrated by the success of Sheriff Swift, of Carson City, in the breeding of that animal. Mr. Swift has the best band of imported goats in this State or California. His band consists of about 3,000. All his bucks and many of his ewes are imported, and all, with the exception of a few strays, will shear large fleeces, some as high as nine pounds, measuring—the longest staple—18 inches. Mr. Swift's farm is within one and one-half miles of Carson. His band is worth a visit from any lovers of stock of that description.

W. G. A.

THE OSTRICH INDUSTRY.—Any of our readers who may have thought of starting ostrich ranches are warned that it appears that considerable capital would be required to get the stock. We read that at a public sale of ostriches at Middleburg (in South Africa), twenty pairs of breeding ostriches realized an average of nearly $1,000 per pair. The lowest price given for a single couple was $650, and as much as $1,425 was paid for one pair of birds. It is said that a few years ago ostriches could be procured in South Africa for the catching, and were purchased for a mere trifle for exhibition purposes in England, whereas at the present time a live ostrich does not exist in London. The importance of the birds on the ostrich farms of Cape Colony may thus readily be realized. Even the eggs of the birds, once commonly collected as curiosities, are now hardly obtainable, being reserved for breeding purposes. And while such keen competition exists for the birds themselves, their produce is also eagerly sought for. At a recent sale of ostrich feathers at Port Elizabeth, a parcel of selected "bloods" realized the fancy price of $288 per pound, or about $3 for each separate feather.

Improved Gold Washer's Bowl.

The following is a paper read by Melville Attwood before the California Geological Society: Batea is the name of the gold washers's bowl, or vanning dish, used in the placer and gold mines of Brazil; a small implement which affords the most simple method of separating on a limited scale, the grains of gold from the dirt, sand, pyritic matter, magnetic iron, etc. The form of the batea in common use in Brazil is a circular, shallow wooden dish, or bowl, rudely fashioned with an adze and chisel, varying considerably in depth and size, but nevertheless, in practical hands giving remarkable results.

In 1853 I had a few bateas made of a much better form, the inside being turned smooth to the center in a lathe. I introduced them at that time into the mills under my control at Grass Valley and Agua Fria, where they were used for the purpose of testing or making mechanical assays of the tailings, blanket-washings, and as a concentration to find the percentage of pyritic matter in the vein-stone under treatment.

Some years ago numerous samples of sea beach, or gold sands, were sent to me for examination, and as the batea I had then in use did not separate the gold particles as clean and rapidly as I wished, induced me to make further alterations. After many trials and much trouble I succeeded in getting the form I now use. Those persons accustomed to use the horn spoon, or pan, would be astonished at the ease and rapidity with which the gold in the sands can be washed out with the improved form of batea. As a concentrator for small parcels, or to test the working of a larger one, nothing that I have yet seen in operation can equal it. To test the value of gold quartz, Mr. Phillips, in his "Metallurgy of Gold and Silver," says:

"The most accurate results are obtained by carefully washing a *four*-pound sample in the batea. After having in this way concentrated the gold in about an ounce of sand and pyrites, this residue may be either subjected to assay, or the sulphites dissolved by nitric acid and the gold, extracted by amalgamation with a little mercury, which is subsequently volatilized and the gold weighed. In either case the calculations are made on the *four*-pound sample, and when the residue has been subjected to fusion, very accurate results are obtained."

It is very difficult to give written directions that can be followed for the use of it, but a few lessons from those accustomed to its use will enable any one to become a proficient in a very short time. I will, however, quote the directions given by W. W. Smyth on the use of the old form, and that of Mr. H. Hanks, more recently, in his valuable paper on "Quicksilver," published in the *Alta California:*

"A quantity of the material to be operated on having been mingled and well-stirred by hand with water in the bowl, it is shaken from side to side and circularly, with a variety of movements suited to the form and to the nature of the ore, only to be acquired by long practice. The settlement and the separation of the gold is partly assisted, also, by striking one side of the bowl occasionally, so as to arrest the course of the particles for the moment; and, finally, several different layers or lines of mineral matter may be distinguished from one another, the gold occupying the lower position, then the magnetic iron, then the pyrites, and, lastly, other wastes."

Mr. Hanks says: "The manner of using the batea may be described as follows: Quite a quantity of water will be required. This may be contained in a tank or large tub, or may be a convenient place near the bank of a stream or lake. The pulverized ore—several pounds at a time—is placed in the batea, which is gradually sunk in the water. Several times, it is broken down with the fingers, while the batea floats on the water. When the ore is thoroughly wet and formed into mud, the batea is taken by the rim with both hands and again sunk in the water. A circular motion is then imparted to it (soon learned by practice). The lighter particles will continuously flow over the edge and sink, while the heavier ones collect at the center.

"When only a small portion remains, the batea may be lifted, and the water held in the depression caused to sweep round the center, while one edge is slightly depressed. This motion will gradually remove the heavier particles toward the depressed part. If there is any gold, platinum, galena, cinnabar, or other unusually heavy substance, its gravity will resist the power of the water, while comparatively light particles move slowly forward. The form of the vessel is such that the heaviest matter forms a *point* and can be closely observed. If there is a particle of cinnabar present, it will be found at the point of the prospect, clearly distinct from all other substances. The value of the batea to the prospector cannot be too highly estimated, and it should come into more general use."

Mr. John Roach, the well-known optician, has used the batea, for some time, to assist him in some of his metallurgical investigations, and has generally a few of them on hand. However, he very kindly gave me the following direction, by which, he says, any good turner will be able to make them.

"A disc of 17 inches diameter, being turned conical 12°, will have a depth of 1⅞ inches from center to surface. The thickness may be five-eighths of an inch. The outer edge, perpendicular to axis, will require wood 2½ inches thick for its construction; the best wood, Honduras mahogany."

To millmen, it is almost useful instrument; enabling them, amongst other things, to test what quicksilver is being carried away in the tailings. Silver ore can easily be separated from its gangues. The litbologist it will help greatly to his examination of the basaltic and metamorphic rocks.

The movements of most of the large concentrators can be easily copied, particularly that of the percussion table, but with the difference in favor of the batea, that the shock, either light or hard, can be given and varied as required, by striking the side of the bowl with the band.

A Fair Hint from Colorado.

At their fairs in Colorado they exhibit their cabbages and potatoes, their wagons and agricultural machinery, their rag-carpets and pickles, they race their horses, and do many other things just as other States do, but they differ from some others in that they do not leave one of their most important industries unrepresented. At the fifth annual fair of the Boulder County Industrial Association, one of the finest displays was a collection of ores from the many neighboring mines. A Colorado paper describes it:

Passing in at the main entrance Mr. H. P. Walker's cabinet of free gold ore from the Golden Age was fairly dazzling with nearly, if not quite, 200 specimens, all literally strung full of coarse gold imbedded in white quartz. In the middle was a 50-ounce retort, which was an appropriate center piece for such a display.

Next came some large chunks of ore from the Black Cloud mine with a brilliant play of colors upon the admixture of different minerals. Standing on the ground were some chunks of antimonial silver ore, too large to place on the table, from the Band of Hope mine, on Four Mile creek. They were labeled 400 ounces silver to the ton. The John Jay and Last Chance mines furnished their usual display of large and rich chunks of telluride ore, showing that they are still producing largely. The Celestial, at Ward, furnished a large chunk of free gold ore; and the St. Joe, at Gold Hill, a large chunk of telluride quartz.

The Smuggler made a remarkably fine showing of massive telluride ore, much of it from recent developments. Caribou was also well represented by large chunks of rich ores from the No-name and Caribou lodes.

Again, in another paper:

Capt. E. Rowland made a splendid display of Black Cloud ores, and samples of concentrate from the Black Cloud Co. mill, representing zinc, lead, iron pyrites, and sand separated from the ore.

Mr. Williamson, of Sugar Loaf, exhibited samples from his rich Gray Copper lode, one of the best mines of Colorado.

Then comes the list of awards:

H. P. Walker, of the Golden Age mine, Jamestown, received the first premium for the best show of gold quartz, found in Boulder county, from one lode; also the special premiums offered by Levy Bros. & Strasburger and T. J. Moynahan, amounting in all to value of $40. Mr. Walker also obtained first premiums on best show of gold quartz in Colorado, and also for largest display of gold bullion from one lode in Boulder county, and also the special premium of $10, offered by Col. Phillips. Mr. Walker was also awarded a diploma and $5 for best collection of ore showing native gold, not less than 25 specimens.

Col. Ivers Phillips took the prize for the largest display of gold bullion.

W. H. Lessig took the first premium and diploma for the largest display of tellurium ores. These were from the Smuggler mine.

Harris & Bennett, of Sugar Loaf, were awarded $25 and a special of $5 by G. A. Duncan, for best display of silver ore from one lode in Boulder county.

Capt. E. Rowland, of this town, was awarded the first premium for the largest collection of silver ore, and also for the finest cabinet of ores, precious stones, fossils and petrefactions found in Colorado.

The society offered liberal premiums for rock drilling. For double hand drilling the first prize was $40; second, $20. The entries were W. H. Parentor and John Wormdorff—time, ten minutes—rock, hard granite, and drilled 10⅜ inches. Joseph and Isaiah Yates, worked together, drilling 15½ inches. C. A. Havers and E. A. Vaughn made 11⅞ inches. The Yates boys took the first prize.

Single hand race—time as before. Isaac N. Loper drilled 5½ inches; B. Nelson Burger, 4 7-10 inches; A. E. Johnson, 7 6-10 inches; C. M. Johnson, 10 7-10 inches. The first prize was $30, the second $15. C. M. Johnson of course took the blue ribbon in the contest, doing the best single hand drilling on record. Together the premiums amounted to $105. The inducement was sufficient to call out the best drilling talent of the mountains.

THE Beaconsfield mine, Winnemucca mountain, has a 5-foot ledge, principally carbonate and assaying from $100 to $200 per ton.

DURING the month of September there were 2,935,735 pounds of silver-lead bullion shipped from Utah.

A Model School of Mines.

The Colorado State School of Mines is situated on the line of the Colorado Central railroad 12 miles west of Denver, and within the foothills of the Rocky mountains. It is endowed by the State, and is well equipped with a chemical and assay laboratory, mineral cabinet, and other apparatus requisite for such an institution. The specialty of the school is mining engineering and metallurgy. Its proximity to the most celebrated mines and smelting works of Colorado affords the student every facility to obtain a thorough knowledge of mining operations, and particulary of the treatment of the refractory ores of that State. Students have the privilege of visiting the works at any time, and inspecting all the operations, and thus rendering themselves practically as well as theoretically familiar with the works. It is proposed to have a vacation course next season, in which the students will visit all of the principal mines and works in the State, remaining a long enough time at each for thorough instruction in the details of the various mining and metallurgical processes. This course will be under the immediate charge of the head of the institution, and of the professor of geology. It will be endeavored to obtain special excursions rates on the various railroads over which the students will travel, in order to render the expense of this trip as small as possible. The course will be open to others than those on the roll of students; and any one desirous of taking this vacation course without pursuing the regular course of studies in the school, may do so on application. This offers an excellent opportunity to students in the eastern colleges to spend their vacation in a manner which will be both agreeable and of benefit. The officers of the college are: President, W. A. H. Loveland, president of the Colorado Central R. R.; and secretary, E. L. Berthoud, chief engineer of the same railroad. The faculty are: Milton Moss, professor in charge and Assistant Commissioner of mines; Gregory Board, director of the Golden Smelting works, mineralogy, metallurgy and assaying; E. L. Berthoud, mining engineer, Rev. T. L. Bellam, mathematics; Rev. Arthur Lakes, geology.—*American Manufacturer.*

A New Dry Washer.

Mr. J. H. Small, says the Los Angeles *Express*, has just invented and filed a caveat upon a dry washer for placer diggings. The machine is comprised within a frame-work three feet square and four feet high, and weighs but a few hundred pounds, being compact and easily handled. A hopper on top receives the dirt, which, passing through a small opening, falls upon a cone of Russian iron, and is thence distributed evenly on the outer rim of a stirring pan below. This cone has an oscillatory motion to prevent the dirt from clogging in its descent, and the stirring-pan mentioned is provided with revolving fingers, which keep the dirt constantly in motion and pulverize it. As the pan fills from the outer edge the dirt is crowded inward by the fingers and finally is forced, with a sifting motion, over a rim and through an aperture in the middle. Thence it falls upon a drumhead of canvas below. The drumhead has beneath it a bellows-blower which forces air through the canvas and thus blows out the pulverized dust resting upon it. The action of the machine is such that the coarsest gold is deposited against the inner rim of the stirring-pan. That which passes over the rim and falls upon the drumhead collects against a little interior rim which is placed upon that. The whole machine is operated by a crank and a system of pulleys and piston-rods communicating the various motions. Mr. Small ran a pan of dirt through the washer having previously deposited in it five little pieces of gold varying from the size of a pea to half the size of a pin-head. When the drumhead was taken out and examined, the five pieces were found snugly deposited against the inner rim mentioned. It is thought by experts who have put the machine to a thorough test, that it at last answers the requirements of a dry washer, which have been sought so long in vain heretofore. If this is the case, Mr. Small has a fortune in his invention. He has spent the last three months in unremitting labor upon it, and has expended, besides, several hundred dollars, and we think he deserves any success he may attain. Mr. Small claims, as a leading merit of his invention, that it will operate upon either coarse or fine dirt, and does not even require it to be dry.

NICKEL SMELTING IN NORWAY.—The *Iron Age* translates from *Dingler* as follows: At Kragerce, Norway, magnetic pyrites holding on an average 1.25% of nickel is worked by the following process. The raw ore is smelted with slag from refining in a 13-foot three tuyere shaft furnace, the slag made being thrown over the dump while the raw matte, holding 3.5% of nickel, is roasted in stalls. This roasted matte is smelted in a low furnace with one tuyere, four feet high. The slag, holding one to 1.5% of cobalt, goes to the ore smelting. The matte made contains 30% of nickel and 15% of copper, and is returned to the same furnace, which concentrates it to 60% of nickel, 30% of copper. The sulphur is only 10%. This matte is ground and roasted completely in a small reverberatory furnace, and the oxides are reduced with charcoal powder in graphite crucibles, yielding 68% of nickel and 30% of copper.

MECHANICAL PROGRESS.

Sugar-Making Machinery.

We believe our founderies and machino shops are called upon to furnish sugar-making machiacry for the Sandwich Islands. It may interest somo of the designers of this liae of manufacturo to read of a fine sugar outfit which wae recently made in Scotlaad for Triaidad. Glasgow is the headquarters in Great Britain for this work. Correspondents of *Iron* describe what is called a very fine plant. It includes a horizontal engine, with steam cylinder 21 inches in diametor and 42 inches lougth of stroke; link motion, reversing gear, boiler-feed and lifting pumps, a fly-wheel 18 feet in dismeter and weighiug abont 8 tons, and componad gearing in the proportion of 20 to 1. The mill rollers, three in nnmber, are 28 inches in diameter and 66 inches long. They are borne on headstock, the chief feature in their construction heing tho fact that they are built up of wrought iron instead of being of heavy solid castings, which are always liable to snap when powerful strains are suddenly put upon them. The mill pinions, which are usually placed on the inner side of tho cane rollers, aro, in this mill, keyod upon small iadependent shafts, which aro absolutoly fixed in relation to each othor, aud are connected to the rollers hy means of an arrsngement of tail bars. Snch a modo of arrangement is a great advantago, inasmuch as the adjustment of the rollers so that their axes shall be parallel can readily be effected without in any way disturbing the adjustmont of the pinions; and as these are always runaiag up at their true pitch line they are consequently much less liable to breakage. The pinions are mado of malleahle cast iron. The caae-juice pump, which is 18 inches in diameter, with 18-inch stroke, ie drivon by a disc-plate from the megass-rollor axle. All the parts of this sugar-mill are made so as to be interchangeable with the corresponding parts of mills on no fewer than four other sugar plantations on the island of Trinidad. The mill in weight is fully 80 tons, and is calculated to crush cane enough to yield 1 ton of sugar per hour.

Steel as a Building Material.

We alluded in a former issue to the investigation heing made under the auspices of the London Board of Trade as to the use of steel for structural purposes. The investigating committee has finished its work and reports as follows: Having given the subject our hest consideration, we recommend that the employment of steel in engineering structurcs should be authorized by the Board of Trade under the following conditions, namely: 1. That the steel employed should be cast-steel or steel made hy some process of fusion, subsequontly rolled or hammered, and that it should be of a quality possessing considerable toughness and ductility, and that a certificate to the effect that the steel is of thie description aad quality, should be forwarded to the Board of Trade by the eagineer respousible for the structure. 2. That the greatest load which can be brought upon the hridge or structure, added to the weight of the superstructure, should not produce a greater strain in any part than six and ono-half tons per square inch. In conclusion, we have to remark that in recommending a coefficient of six and one-half tons per square inch for the employment of steel in railway structures generally, we are aware that cases may and prohably will arise when it will be proposed to use steel of special make and still greater tenacity, and when a higher coefficient might be permissible, but we think those cases must he left for consideration when they arise, and that a higher coefficient may be then allowed in those instances where the reasons given appear to the Board of Trade to justify it. It will be obeerved that a coefficient of six and onc-half tons per square inch is assigned to steel, that of iron heing six tons per square iach. This increase of the coefficient will effect important economy in structures, especially in bridges of large spans, and will also tend generally to increase the employment of steel for railway and shipbuilding purposes.

THUM'S FURNACE FOR GALVANIZING IRON.—In galvanizing iron, says the *Iron Age*, the main point to ensure a uniform coating of zinc is the maintenance of a thin hath of metal. Unfortunately the zinc absorhs iron, thickens, and as tho temperature must he rapidly raised, when it does so this absorption goes on increasing until the metal is unfit for further use. This is aggravated by the fact that the metal is melted iu cast or wrought iron vessels heated from below. In order to avoid the disadvantages of iron vessels, and yet retain ample working space ahove the surface of the metal, F. A. Thum, of Lauhach, Germauy, has constructed a furnace resembling somewhat a reverheratory furnace. It has a fireplace and a chimney at each end, the part of the hearth connecting the two being arched over. The rest of the rectangular hearth is perfectly open above, so that the heat-conducting power of the metal is relied upon to keep it at the proper temperature in that part of the hearth. The slabs of fresh zinc are introduced through doors communicating with the hot ends. The staying of the furnace has to he very strong, in order to prevent any accidents to the arching over the ends of the hearth.

Testing Iron and Steel with a Falling Weight.

The reports which come to us in foreign exchaages of tests made at the Paris exposition to determine the strength of different forms of iroa, are very interesting. A paper read at a meeting of mechanics in Paris by an expert, Rickard Akerman, is the source whence we draw the following facts. In testing boiler plates of Bessemor steel, Swedish iroa and English iron, the hall used as a falling weight had a weight of 872 kilogrammes, spherical in its lower ond, and a diamcter of 253 millimeters. The interior diameter of the iron foundation to which the plates were fastened during the tests with 36 rivets in a double row was 537 millimeters. The diameter of the falling weight was thus to the diamctor of the part of the plate exposed to buckling as 10 to 21. All tho plates were niue millimeters thick and one meter in diameter. The Bessemer and Siemens-Martin steel plates withstood from 5 to 9 blows from a hight of 4.5 meters without the least failure; while the Swedish iron plate only withstood 4 to 6 blows of the samo weight from a hight of only 1.5 meter, or a third of the hight in the ingot-plate tests. Further, in these tests, with a falling weight, the huckling before the least sign of fracture averaged 150 to 160 millimeters, while the Swedish plate of puddled iron never permitted before fracture greater buckling than 104 millimeters. Nevertheless, the Swedish iron plate was, as such, of very superior quality, for tests, made with the same falling weight, of best-best Staffordshire and best Yorkshire plates, showed that the former gave way at the first blow from a hight of only one meter, while the Yorkshire plate at the utmost withstood three blows from a hight of 1.5 meter, and showed in that case a huckling of 68 millimcters. When the hight of fall of only 1.5 meters used for the puddled plate was employed for the ingot plate, the latter withstood 25 blows, while, on the other hand, the weight at the first blow passed through even the Swedish plate of puddled iron when the fall-hight of 4.5 meters used for the ingot plate was also employed for it. Tests were also made of the ingot plate with a fall from a hight of up to nine meters, when it withstood before fracture threo blows with the same buckling as in the case of the lower hight, also before fracture.

These experiments, hesides, show how enormous is the influence which the content of phosphorus exercises on the power possessed by iron of resisting blows; for the main difference between the chemical composition of the different puddled plates lay in their contents of phosphorus, for while the Swedish puddled plates contained only 0.016% to 0.021% of phosphorus, the percentage in the Yorkshire plate was 0.094 and in the Staffordshire plate 0.203. In addition to this differnce in the content of phosphorus, there is also in the Staffordshire plate a larger quantity of silicon, or more probably of cinder. No proper difference between Bessemer and Siemens-Martin plates could be discovered in the course of these experiments, which comprehend both complete analyses and tension tests. Yet it almost appears as if the Martin plates have a somewhat greater ductility than Bessemer plate with the same content of carhon.

THE POINT OF GREATEST STRENGTH IN METAL.—Numerous experiments have been conducted by several eminent engineers to prove the tensile strength of iron and steel, both in the shape of bars and plates. Unfortunately, however, many of the tests have heen carried out with rude testing machines, rendering it difficult to obtain a true result of the endurance and strength of the metal under investigation. In addition to this a large proportion of the specimens tested have been of short leagths of metal, varying from 2 ia. to 4 in., and in all such cases a higher tensile strain has been noted than can he depended upon in practice, while the elongation has also heen much overstated, a largo proportion of the extension of the specimens arising from a contraction of area, or what is called "breaking elongation." With an accurate and sensitive testing-machine, the maximum load is always carried in the mild ductile metals when about five-eighths of the elongation has taken place; the remainder, down to the point of hrcakage, is developed with a gradually reducing load. Ordinary iron boiler-plates and hard steels are an exception to this law, and nearly universally break with a maximum load, but with little or no reduction of area.

STEEL IN SHIPS.—A speaker at the British Iron and Steel Institute said: Should it ultimately be proved that sea-water would destroy steel quicker than wrought iron, the use of wrought iron for the skins of ships might he continued; hut, with present knowledge, nothing, in his opinion, existed to prevent the whole framework of every steamer and sailing vessel being constructed of Bessemer or Martin-Siemens steel, as at least one-third the weight might be saved at the same time that greater security was ensured. In the diluted sulphuric-acid hath the evidences were quite clear in favor of mild steel and the purest iron to resist corrosion, but before as much could he said as to the influence of sea or salt water a more extended and careful series of experiments would be required.

SCIENTIFIC PROGRESS.

A New Derivitive from Opium.

T. and H. Smith furaish the *American Journal of Pharmacy* a descriptioa of *meconoiosin*, which they have derived from opium. In the final isolatiou of meconin, the oleaginous-like liquid containing it, upoa being left to itself for some days, sets into a mass of crystals. Those crystals, upou heing drained, and csutiously washed with cold weak spirit, aro to be boiled in a large quantity of water. The filtored liquid gives a crystallization of meconin, and the mother-liquor, when concentrated, and upon being set aside for a time, yields heautiful leaf-like crystalline masses of the body, to which we have given the name of *meconoiosin*.

This remarkable crystslline form, which, in in its impure state, is assumed by meconoiosin, as well as the brown color of the crystals, enahles this body to be readily distinguished from the soft and nearly white meconin, which crystallizes along with, and upon it, in a manner not unlike the incruststion of minute shells upon a rock. If this meconin be now removed, the meconoiosin, by means of a few crystallizations from hot water, with the aid of charcoal, may be obtained in a pure state, free from color.

This substance is especially interesting because that now, in it, a second chemically indifferent body existing in opium is met with. Hitherto meconin alone has been distinguished hy this characteristic. Moreover, the respective chemical constitution of those two opium products reveals an apparent relation, meconin heing represented by the formula $C^{10}H^{10}O^4$ and meconoiosin by the formula of $C^8 H^{10}O^2$. Both bodies are freely soluble in alcohol and ether, but as regards their soluhility in water, the two substances present a striking contrast. Meconin is very slightly soluble in cold water; and in boiling water, unless in the proportion of about 1 in 50, it refuses to dissolve, remaining at the bottom of the liquid, like a heavy oil. Meconoiosin, on the other hand, is soluble in 27 parts of cold water, while in boiling water it is soluble to almost any extent, forming as the heat rises, and before being shaken up, a syrupy solution at the hottom of the liquid.

A MARTYR TO HIS THEORY.—A sad accident occurred lately at the gymnasium at Prague. Prof. Fischer was found poisoned in the physical laboratory. He was only twenty-five years of age, but a person of the greatest promise, by reason of his great abilities and industry and his devotion to chemistry. All the circumstances connected with him exclnde the suspicion of suicide. All that is known of the catastrophe is that, being in the laboratory, he sent a servant to the storekeeper for some sal-ammoniac and some cyanide of potassium. He mixed them and tasted the mixture, saying to the servant, "science has advanced so far as even to be ahle to render harmless so dangerous an agent as cyanide of potassium." But he had scarcely tasted the mixture when he was seized with violent pains. He at once told the servant to fetch a physician, hut before he came Dr. Fischer was beyond human aid. He was known to entertain the persuasion that cyanide of potassium could be rendered harmless, and the problem how to accomplish this was a frequent object of his meditations. A memorandum on this theme was found among his papers. Doubtless he fell a victim to a rash experiment.

A NEW DENTAL COLLEGE—The new building erected for the use of the Dental School and Medical Laboratory of the University of Pennsylvania was recently opened and dedicated. It cost nearly $60,000 and was the gift of a number of individuals. In an opening address Dr. Mitchell reviewed the progress of science in the last fifty years, and in speaking of the estahlishment of lectures on dental surgery at the University said that two chairs have been created by the trustees—one of Mechanical Dentistry and Metallurgy and the other of Operative Dentistry, Dental Histology and Dental Pathology. The students will share with the medical students the instructions of the teachers in the branches of physiology, pharmacy and anatomy.

PLATINUM PLATINO.—All the attempts made until now to coat metals with platinum with the acid of gelatine action have, says the *Iron Age*, proved unsuccessful, hecause the film deposited on them was generally dark gray in color and was apt to come off in flakes, so that it was impossible to employ the mcthod for the protection of copper or vessels of other metal against the action of acids. Boettger has succeeded in overcoming these difficulties, using as a galvanizing liquor a hot solution of freshly precipitated chloride of platinum and ammonia in a solution of citrate of soda. Two strong Bunsen elements will euffice.

A PIGEON LIVING WITHOUT A BRAIN.—Dr. McQuillen recently described before the American Philosophical Society a case of the extirpation of nearly the whole of the cerehrum of a pigeon, operated upon by himself. He desired to place on record the fact that the animal not only survived the operation 24 days, but that it gradually regained its usual powers and habits of flight, and its ability to feed itself and drink. Only one other such case is on record.

Mental Logarithms.

Some years ago, ahout 1863, Mr. Oliver Byrne, formerly Professor of Mathematics in the College of Civil Engineers at Putney, discovered aa entirely new and ingenious method of arithmetical calculatioa of great practical importance to eagineers and others, aad which was claimed to enahle aayone acquainted with the ordinary rules of common arithmetic to extract the roots of cubics, equatioas of the fifth degree, aad higher equations; to determiae aagular msgaitude and trigoaometrical lines, to solve plaae triangles without the use of tables, aad generally, to deal with almost innumerahle problems which had previously heen considered to reqnire great mathematical skill, and an intimate acqusintance with the higher hraaches of the science. But, owing to the discoverer having adopted a peculiar and nnfsmiliar system of notation in explsining the art, many have regarded the whole suhject as unintelligihle, if not useless. A complete remedy for this has now beon found by Mr. Edward David Heara, M.A., of Columbia College, New York, whoso name is already known to mathemsticians as the author of an extension of Horner's method for the synthetic division of algehraic quantities with detached co-efficients, and of an elucidation of Suffield's method of arithmetical synthetic division. Mr. Hearn contributes to the October number of *Scientific Review*, an interesting paper on "Mental Logarithms," in which he demonstrates thst all the developments of which Mr. Byrne's art is capahle, are not only practicahle without departure from the ordinary Arahic notation, with which every schoolboy is familiar, but that the common notation really increasca the speed at which the calculations on the new system can be performed.

COMPOSITION OF MR. DARWIN'S DROSERA.—*Drosera rotundifolia*, Lin., has been analyzed hy G. Lugan. The fresh plant was treated by dietheralysis, the process recommended by Legrip (*American Journal of Pharmacy*, 1876, p. 235). The aqueous liquid obtained thereby contained glucose, various salts and a crystallizable organic acid, which appears to be peculiar to this plant, and was also obtained from the ethereal liquid by evaporating it and treating the residue with chloroform, which leaves it nndissolved, together with wax and yellow coloring matter. On evaporating the chloroform, a greenish-brown resin was left, which had a strong and characteristic odor, was exccedingly acrid and produced a burning sensation when applied to the skin. Contrary to the observation of Reiss and Will, the author found the viscous exudation of the glandular hairs to bo destitute of acid reaction, and was unable to obtain formic acid, which was stated to he the principle hy which the leaves convert albuminoid mattor into peptones.

THE LIEBIG MEMORIAL.—In response to an invitation issued by the Executive Committee at Munich, various models of a proposed statue to the memory of Liebig have heen sent in by sculptors from different parts of Germany. The jury appointed to select from them the first and second best models met there recently, and awarded the prizes of 2,000 and 1,500 marks offered by the committee to Herr Wagmuller, of Munich, and Herr Begas, of Berlin, respectively. A sum of 120,000 marks is available for the completion of the work, and the committee have given notice that in accepting any particular model, they reserve to themselves the right of erecting in Giessen a copy of the original work abont to be placed in Munich.

LIBERALITY TO SCIENCE.—*Nature* says that M. Bischofsheim, the well-known Parisian banker, has sent a sum of 1,000fr. to the French Bureau Central Meteorologique to help in the construction of the intended Mount Ventoux observatory. We may remind our readers that he, at the suggestion of his friend, M. Leverrier, helped in the same manner the construction of the Puy-de-Dome and Pic-du-Midi establishment. M. Bischofsheim has also agreed to pay M. Eichens £1,000 to complete within a year the construction of the great refractor hegun in Leverrier's time, in 1870.

PECULIAR ACTION OF PETROLEUM.—A very curious effect (says *La Nature*) is produced on oils of petroleum, even the lightest, by addition of pulverized soap-wort (an herhaceous plant of the family of *Caryophileæ*). The powder being digested in water and mixed with the oil, the latter forms a very thick mucilage, so that the vessel in which the experiment is made may be inverted without its contents escaping. What is still more singular, if a few drops of phenic acid be added, and the mucilage agitated, it hecomes in a few minutes perfectly limpid.

A RUSSIAN TECHNICAL LABORATORY.—The Russian Ministry of Roads and Communications has established at the St. Petershurg Engineering School a great technical laboratory, provided with apparatus for testing all kinds of materials for construction, such as stone, cement, metals, wood, etc. Any one can have materials tested there for a small sum.

PERUVIAN COAL.—The *Chemiker Zeitung* informs ue that a rich deposit of coal, sufficient for the supply of all South America for a long period, has been discovered at Chala-Alta, in Peru.

Table of Highest and Lowest Sales in S. F. Stock Exchange.

Name of Company.	Week Ending Oct. 3.		Week Ending Oct. 10.		Week Ending Oct. 17.		Week Ending Oct. 24.

Mining Share Market.

A few weeks ago it was the regular habit of the stock market to have dcclinc towards the end of each week, from a rise at the begiuning. This scemed to be based upon sucb reasonable grounds—a desire among business men to wind up accounts towards the end of each little period—that it is rather snrprising to see a directly opposite tendency now. As the week draws to a close now the market becomes more lively.

The crosscutting so long promised seems almost as far off as ever, and it is tiresome to see tbo patience with which some papers repeat, and repeat again their prophecies. The market has hung for a long time on Sierra Nevada and Union Con. Bad news came from these mines, and showing a disposition to rise all along the line, when strikes were reported, or when conciliatory movements between Skae and Flood have been rnmored, as was the casc tbis week. It is now urged, as should have been done long ago by those wbose dnty it is to "point" the market, that more attention should he turned to the south and middle Comstock. All stockdom could not live on a few hundred feet of the lode, even if other places had no promise whatever.

Nevertheless, the dependence of all the stocks upon the condition of a very few mines continues, as is proved by tho following from tho Gold Hill *News:* "The stock market for the past week has been wavcring and unsteady. For this there have been two causcs; one of which was the doubt engendered as to whether the Ophir and Sierra Nevada would bc able to successfully handle their own and the Union Con. water, and the other a restless, nneasy feeling created by the disputed title to a portion of the new bonanza, both the Sierra Nevada and the Union Con. laying claim to it." The advice given is to have an eye nn Savage nr Gould & Curry, or some other on the Comstock. Our advice would bo: Havo an eye to eastern Nevada, Arizona, Idaho, Oregon and southern California, and the Comstock holders keep their shares.

MAP OF BODIE.—We have received from the publisher, L. J. Lewis, 424 Montgomery street, a lithographic map of Bodie mining district, oompiled from authentic surveys. It shows all the prominent points, locations of the various mines, etc. A tahle of routes and distances is also given: "From San Francisco to Carson, hy rail, 325 miles; from Carson to Bodie, by stage, 119 miles; total, 444 miles. From San Francisco to Milton, by rail, 119 miles; from Milton to Bodie, by stage, 150 miles; total, 269 miles. From Aurora to Bodie it is 19 miles, and from Bridgeport to Bodie it is 20 miles. The altitude of the town is 8,700 feet above sea level, and that of Bodie Bluff, 9,400 feet. There are three quartz mills in Bodie, having 46 stamps."

Mining Summary.

The following is mostly condensed from journals published in the Interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

BETTER AND BETTER.—*Ledger*, Oct. 10: Favorahle reports coutinuo concerning the Downs mino. Another clean-up was made last Monday. The rnu amonnted to 68 tons of rock, and ths yield reached the gratifying sum nf $3,100, over $45 per ton; the best run yet made. For mining, hauling and milling the expanses reach about $10 por ton. Tho ore for the last run was taken from tho shaft, but that in the tunnel looks even richer, and will, at a low estimate, surrender $60 per ton. The eugins for the hoisting works is on the ground and will bs put in positiou Monday. The hoiler will also be on haud in a few days. S. Breece, of Sutter Crock, has charge of tho erection of the hoisting works.

CENTENNIAL.—The 20-stamp mill is expected to be started up within the next two weeks. Sinking has attained 330 feet deep, with a four-foot ledge in the hottom of the shaft. Thcrs is ore enough on the dump to keep the mill running 60 or 70 days. There ars 13 men at present in the employ of the company. When the mill gets started ths company will give steady work to ahont 30 hands.

OTHER MINES.—Along ths Consnmnes river prospecting is proceeding hriskly. R. Sumner & Co.'s gravel hank is turning out well. Thsy have expended in the neighborhood of $2,000 in fixing up for hydraulicing. For the last two months they have been making inroads npon the auriferous bank, and are sanguins that a splendid clean-up awaits them. . Several other gravel claims are paying well. Some rich pockets or crevices in the river bed are being found. One of these crevices lately panned out $3,000. The Empire mine at Enterprise, has commenced operations. Both mine and mill are running by steam. Rumor has it that other mines thereabouts will start hefore long.

ITEMS.—The marble from H. L. Joy's newly discovered quarry near Slahtown proves capahle of recciving fine polish. The Montirichard company are sinking their shaft an additional 100 feet. The Moore hoisting works are making rapid headway. The contract for the supply of lumher for the mill, to the extent of 42,000 feet, has heen let to Mace and Whitmore, and part of the material is already on the gronnd.

BUTTE.

REVIVAL IN MINING.—*Record*, Oct. 19: There is much talk of reviving mining operations on the Dogtown ridge. The introduction of water, which will soon take place on the bank deposits of gravel along Butte creek, will revive the old-time glory and splendor of Butte creek. Some of the former claims on the ridge between the West Branch of the Feather river and Butte creek are being re-opened and prospected, among them the old Barret claim and others, that were found rich in mineral deposits years ago. The fact is, these claims were all successfully worked until the discovery of mines in Nevada, Idaho and Montana, and were ahandoned by men and capital for new ventures in fields east of the Sierras. If there is no positive reaction now, in favor of the mines of this section, attention is being attracted to them, and it will not be long until the whole section watered by Butte creek and the West Branch will he as successfully worked as in former years. The gravel mines on the hill above Oroville are again attracting attention, from the fact that William Gilston is taking out large sums daily, from a claim that he has opened.

NOT YET WORKED OUT.—Oroville *Mercury*, Oct. 18: It has been a nnmber of years since the lava beds below town have been mined, but they have not yet been worked out. We learn that there arc six engines and about 2,000 Chinamen at work taking out gold. One claim working 25 men takes ont $400 each week; and another, owned by Fong Lee, and worked by 20 men, takes out $600 each week. There is not less than $25,000 taken out each month and sent to the mint below. The mines support qnite a village and makes a pretty good market for wood, poles, hogs, chickens, hay and grain.

EL DORADO.

KELSEY.—Placerville *Democrat*, Oct. 19: The Gold Deposit tunnel was driven ahead ten feet last week, and is still looking as favorahle as heretofore. The air shaft was sunk several feet, and now the workmen in the tunnel and shaft can hear each other quite plainly althongh they are yet thirty feet apart. The water in the main shaft will probahly be got out hy tomorrow night; then the work will be carried on night and day. Everything is life and activity in and about the mine, and general good feeling prevails. A report of a rich strike some six miles east of St. Lawrenceburg, needs confirmation. The rock from the soap mine of Alderman & Co., has been tested by a number of parties, and they all agree that it is one of the hest dotersive agents known.

MONO.

GENERAL REVIEW.—Bodie *Standard*, Oct. 16: Strikes and rumors of strikes have been the order of the week past, and our mining men are proportionately encouraged by the ontlook. Wherever a mine is located the owners are eagerly at work making preparations for the advent of the much-dreaded and long-expected winter months, so as to be ready to work under cover, regardless of the sleet and snow, which may bowl and hlow outside. Our superintendents, without exception, deserve praise for the energetic manner with which they have pushed work forward on their various mines, and, had it not been for the failure on the part of lumber dealers to fill contracts made, would now have heen in complete condition to defy the weather. The snow of Monday was rather a blessing than otherwise, as it served to lay the dust and pack the roads leading thitherward, thus rendering navigation more speedy and reliable. During ths week tho Mono, Booker, Goodshaw, and other mines, whose names escaps us at this writing, have received their engines and erected gallows-frames, etc., and are now either working by steam or soon will be.

BULWER.—The Ralston ledge in the south drift is 15 inches wide. The ledge in the winze is 18 inches wide, and is looking well. The Stonewall stopes are yielding the usual amount of rich ore.

MCCLINTON.—The ledgs in the bottom of the incline is still looking well, and is three feet wide of good milling ors.

IDA.—The ledge in the bottom of ths incline is two feet wide, and a marked improvement has been noticsahle in the last few days in the character of the ore. Assays have been made, resulting in returns of from $10 to $279 per ton.

QUEEN BEE.—The shaft is being enlarged and timhered rapidly. Work on the gallows frame and new hoisting works will bs commenced Wednesday forenoon. The new engine and machinery is on the way between hsre and Carson.

CHAMPION.—A station has been cut out at 250 fest, and crosscuts ars being run east and west, and at the same time work is continued in the shaft. In the west crosscut a fins four-foot ledge has been cut. Everything about the mine is in perfect order, and wood and timbers are being laid in for winter.

BODIE CHIEF.—A very fine ledge of pay ore has been followed for the past 10 days in the new shaft. The mine never looked as well as now, and is one of the best on Bodie bluff.

UNIVERSITY.—The shaft is down 115 feet, with a three-foot ledge of good ore in the hottom. Cribbing is about to be commenced, and drifts will be run on the vein. Ore will thereafter be taken ont steadily.

SANTA MINA.—Sinking the new shaft. The work is being pnshed forward rapidly. A fine ledge of two feet six inches is now in the bottom of the shaft. Indications of fiue ore bodies.

STAR OF BODIE.—In the Star of Bodie a fine ledge was struck in the claim a few days since. Width, two feet at a depth of 30 feet, and widening rapidly. This is the first large ledge discovered on Silver hill. The mine will be worked all winter, and will he incorporated at once.

HUMBOLDT.—The shaft is now down 150 feet, and crosscuts are being run east and west from the hottom. Water has heen struck in considerable qnantities in the west crosscut, and appearances indicate the approach of a ledge. The mine is looking well.

HIBERNIA.—Located on Silver hill, immediately west from the Relief Con. and east from the South Bodie, is situated the Hibernia mine. The work of development has been done hy a shaft, sunk 300 feet from the northerly bonndary in the center of the claim, and has now attained a depth of 50 feet. Forty-seven feet from the surface a foot-wall, which extends thr ugh the hill from one end to the otber as far as explored, was encountered aud the work done has resulted in disclosing a vein of gold-bearing quartz four feet in width. Experiments with the horn have revealed gold in quantities sufficient to make the ore mill from $100 to $500 per ton. Work will be commenced on this mine as soon as the necessary arrangements are completed and but a few weeks will be required to show up a large and valuable pay vein. Captain White has the reputation of being a correct and energetic hnsiness man, and, aided by the reports in his possession, from competent mining experts, cannot fail to make a success of his intended enterprise.

BEACONSFIELD.—This promising mine is situated on Bodie blnff, adjoining the Rough and Ready on the east and the original Summit on the west, and is an extension of the McClinton mine. G. E. Smith, of this place, is now bclow engaged in preparations for incorporating the mine. The work already done consists of a perpendicnlar shaft 62 feet deep, which, in its descent, shows stringers of quartz, widening out as depth is attained.

NEVADA.

DERBEC.—*Herald*, Oct. 19: About 40 tons of gravel is taken out per day at present, and the quantity is increasing as the mine becomes opened. Tho gravel yields from $6.50 to $13.50 per ton, and the general appearance of the mine does not change, but continnes to present the rich breasts, which more than met expectations at its opening.

ITEMS.—The Scadden Flat have purchased the hoisting works, huildiug and the engine bed blocks, of the Eureka company. They found both in good condition, and obtained a good bargain in tho purchase.

Very rich gravel bas been found in the Schultz mine on the Greenhorn, two miles from Banner mountain.

Work is being pushed in the Lincoln mine, on Little Deer creek; the ledge shows well.

The ledge in the Hudson incline, now down 113 feet, is six feet wide and increasing in richness. The ledge contains gold, silver snd rich sulphnrets.

The Eureka Lake compauy ars engaged in digging au sxtension to their upper ditch, so as to carry more wster to the Woolsey Flat mines.

ORIENTAL MINE.—Nevada City *Transcript*, Oct. 15: Mr. Blanding, who was for three years Superintendeut of the Ophir, on the Comstock, snd at present owns two mills in San Francisco, says tbs value of the mine consists in the fact that it presents four distinct sources of profit, viz: First, rock heavily charged with extraordinarily coarsc free gold; secoud, the fabulously rich arsenical pyrites, going into the thousands and tens of thousands of dollars in valus; third, the averags ore proper, yielding from $15 to $20 per ton; fourth, the ordinary sulphurets, amounting to about seven per cent., and yielding from $60 to $90 per ton. The ledge runs east and west, dipping to the northeast, and has an avsrage width of between 3½ and 4 fect.

SAVAGE PLACER MINE.—Virginia City *Enterprise*, Oct. 18: Stockholders of the Savage placer mining company, Sierra county, California, the majority of whom are residents of the Comstock, will be glad to learn thst all is going on in good shape at the mine. S. V. Mooney, of the Consolidated Virginia assay office, who returned from a visit to the mine two or three days sgo, says all is in shape there for a good winter's work. Two substantial and comfortable buildings have been srected, one as a boarding and lodging-honse for the workmen and the other for storing supplies. The storshouse is filled with provisions and mining supplies, a contract for running the tunnel has heen let and the contractors are hard at work and making good headway. The men who have the contract ars miners from the famous gold quartz mine at the Dowuisville Buttes, and thoroughly understand their husiness. It is expected that the tunnel will reach the ancient river channel for which it is being run some tims this winter and certainly next spring. The tunnel will tap the blue lead at a point opposite the head of Jim Crow canyon, which canyon, as all old Downieville miners know, was one of the richest in Sierra county. The example set by the Savage placer might well be followed by other companies, to be formed here and elsewhere, to prospect famous localities in California. They find that an occassional assessment of three cents per share produces all the money reqnired for keeping prospecting operations in full hlast. Previous to starting the tunnel they sunk a shaft on their gronnd and ascertained the whereahouts of the channel, (striking the edge of it, as was known hy the deposit of ancient drift-wood encountered) and, though it was necessary to purchase and set up an engine for this work, no assessment has ever exceeded three cents on the 100,000 shares.

PLACER.

A GOOD MINE.—*Herald*, Oct. 19: Considerable attention is now paid hy knowing ones, to developments made recently in the Rock Creek mine, owned by Messrs. Molin & Heenan. These gentlemen started in on a ledge running parallel with the old Calf Pasture ledge, on Rock creek, and worked steadily during last season with very flattering prospects for a permanent mine. Their machinery, which then consisted of a modern slip whim, driven hy horse power, being too slow for the profitable prosecntion of the work after the rainy sesson set in, they concluded to prepare for enlarged facilities for working their mine to better advantage. Accordiugly they erected a good snbstantial 22-foot water wheel for pumping and hoisting purposes, they cnt, hewed and hauled the timbers necessary for such an enterprise, dug their excavations, hauled their lumber from the mill, and with the exception of tbe assistance of one carpenter, done all their own work until ready to mine. Since commencing to take out quartz they employ several men, and their rock has averaged $30 per ton. They have crushed all quartz taken out from the top down to a depth of 90 feet, their ledge averaging two feet in thickness. This company has paid for its improvements, sinking the shaft and timbering to the depth of 95 feet, and running levels for a thorough opening, out of the proceeds of the mine. We understand that the extension of this mine was recently located by a party from Auburn and vicinity.

ITEMS.—A stone quarry recently opened in the vicinity of Lincoln is producing a fine quality of granite. A party of prospectors have discovered a new mining location on the Middle Fork of the American river, six miles from Soda springs. They commenced work upon it last August and have been at work ever since, but have now ceased for the winter.

SHASTA.

COPPER CITY.—Reading *Independent*, Oct. 17: The mining outlook continues very prosperous for this district, and every foot they go deeper on the ledges shows more positive proof that they are well defined and true lissure veins. The Extra company continue to make their regular shipments of hullion, and Mr. Crane is making the necessary arrangements to keep the mill running all winter regardless of the heavy rains which we are snre to have.

MR. SALEE has connected the tunnel in the Potter mine with the shaft, and has a chute in, so that he can run the ore out in a car instead of hoisting the ore to the snrface by windlass, and the ore of the mine can now he laid on the dnmp at as little cost as any mine in the State, as the ledge is about eight feet wide and of such a character that no blasting is required to remove the ore.

Continued on page 268.

The Mines and the Courts.

Ores Unlawfully Extracted.

The Supreme Court of Nevada has decided, in the case of Waters vs. Stevenson, action to recover damages for the conversion of ore, that plaintiff in an action to recover damages for ores unlawfully extracted from his mines, is only entitled to recover full compensation, to-wit: The value of the ore in place, as it lay in the mine befors beiug converted. The defendant admitted in his answer, and at the trial, that he converted to his own use a certain number of tons of metalliferous ore containing gold and silver; but he denied that he did it willfully or intentionally, and alleged that his entry upon ths mining claim was the result of inadvertence and mistake, under the *bona fide* belief that he was mining within the boundaries of his own adjoining mine. The verdict of the jury was in favor of the defendant's alleged *bona fides*. The District Court held, and so instructed the jury, that if the defendant, hy mistake, and not willfully or wrongfully extracted ores from the mine, plaintiff should recover their gross yield, less the necessary expense of assorting, transporting, hoisting, hauling, milling, and all other expense after tbe ore was picked down in the mine. The defendant requested the Court to instruct the jury to include in his expense the amount per ton which the lessee, by his agreement, was ohliged to pay plaintiff for the privilege of extracting ores, bnt this instruction was refused. The Supreme Court says that the Court erred in refusing to allow defendant to prove the necessary cost of mining the ores in question, and for this error the jndgmsnt was reversed.

Trespass in El Dorado County.

Samuel Snow vs. Michael Kimmer *et al.* Action first commenced on January 22d, 1877, in which plaiutiff claimed that, being owner in fee of a certain 160 acres of agricultural land in El Dorado county, by purchase from the United States, in 1871, the defendants who wsre working a mining claim, called the "Northern Light mining claim," on an adjoining section, had run their tunnel iuto and under one of his forties, towards and near to a spring of water, which he had procured by making a tunnel of 60 feet at much expense, and decreasing its flow, and endangering its continuance, and he claimed damages $300.

Defendants claim a prior mining right on the land dating back over 10 years, as a continuation of their mining claim, and that the plaintiff desiring to pre-empt the certain 40 acres, with other lands, made a verbal agreement with them that if they would not oppose him in ths pre-emption, he would, upon securing a patent thereto, at once convey to them all the gravel on the bedrock of the claim; and they, acting in good faith, did not oppose his pre-emption, and have since run their tunnel as heretofore, and with his full knowledge and consent till May, 1876, for 498 feet through the bedrock st an expense of over $3,000. Had been in such adverse possession for over five years, and now pray for judgment that plaintiff be *required* to convey to them that part of the claim within the 40 acres in question.

The plaintiff demurred but was overruled, and judgment was given for defendant. On appeal the judgment was affirmed. But the Supreme Court reverses the judgment and remands the cause.

Other Cases.

J. W. Tripp, a stockholder in the Joe Scates M. Co., sues the company to obtain examination of hooks and papers, and for an accounting.

J. C. Lennon served the South Comstock M. Co. for five months in the capacity of superintendent. His claim of $969, for services, he assigned to M. Seligman, who has recovered $862.

In the Twenty-third District Court, Henry C. Swain has commenced procesdings for an injunction against the officers of the Joe Scates Con. M. Co., to restrain the voting of csrtain alleged illegal transfer of stock at a meeting of stockholders. It is said that the co-defendants are trustees of ths company, but have never mst to form a quorum, notwithstanding that at their insufficient meetings they voted shares to J. W. Tripp, which made him to appsar the owner of 31,069, when in fact he is not entitled to more than 10,000. Tripp was President of the company and used his influence, as it is allsged, with the Secretary, to have improper entries made in the books.

Lower California.—The San Diego *Union* says: We were shown yesterday by D. O. McCarthy, who returned from a trip to Lower California last week, eome rich specimens of valuable minerals from one of the most remarkable deposits on the Pacific coast. These specimens comprise sulphur, alum, borax, horacite and cinnahar, all being found in the same district. The sulphur deposit is almost pure, the epecimen ehown us being over 95% pure sulpbur. The other minerals are also nearly pure, except the cinnabar, which is very rich. This district is on the Colorado Desert, in the Cocopab range of mountains, Lower California, and the deposits are within eight miles of tide water in "Hardy's Colorado," a branch of the Colorado river. A good natural road now exists between the river and the mines, and it can easily he made first-class. There is ahundant fuel on the ground. There can be no question but that these deposits are very valuable. The mines are owned hy Mr. McCarthy and other Sau Diego parties, who are preparing to put them in working shape.

Lixiviation versus Amalgamation.

W. T. Rickard, F. C. S., writes to the *Arizona Citizen*, enumerating the advantages of the lixiviation of silver ores over that possessed by amalgamation as carried on in Nevada, as follows:

1. The works cost little more than one-half the latter, and the machinery being much lighter, a considerahle saving is effected in freight.
2. The reduction of the silver is accomplished at one-third less expense.
3. There is no loss of mercury.
4. A much larger nercentage of silver is obtained from the ore.
5. Less than one-third the motive power is required and consequent.
6. Great saving in fuel where steam is employed.
7. Great saving in wear and tear of machinery, and less liahility to have recourse to the foundry and machins shops, involving heavy loss through delays and interruptions of work.
8. The silver produced is invariably of the finest quality.
9. When copper is present, as is the case with most of the ores of southern Arizona, it is obtained in a pure state as a by-product; in some cases in sufficient quantities to cover all the costs of reduction of the silver. On the other hand, in the amalgamation process, the copper is entirely lost or makes its appearance in the silver bullion, whose value it materially depreciates. It also has a most destructive effect on the iron amalgamating pans.

Another communication from Mr. Rickard ie now in order, explaining why the lixiviation process has proved a failure, or at any rate not a succees, in Utah, Nevada and California.

Refrigerator Shipments.—The *Iron Age* of New York city says: Our tonnage, which wae bnt 8,000 tons in 1876, is now 28,000 tons. This covers oystere, butter, fruit, eggs, canned goods, and a thousand and one other perishable articlee of food, the export trade of which is increasing enormonsly from year to year. If this thing keeps on it will not be long before America ie tbe butcher shop and grocery etore, as well the granary and manufactory of the world.

The Hairy Woodpecker.

The engraving on this page shows a pair of "hairy woodpeckers" (*Picus villosus*) common on this coast and widely distributed throughout the whole country. The birds are lively, noisy and fearless of men. In the South it may be seen at all seasons in orchards, among the trees of cities, along the borders of plantations, on the fences, on isolated fields, and in the densest forests. It is even found in the salt marshes at the mouth of the Mississippi, where a struggling cotton tree or willow affords an opportunity for the exercise of its skill in boring. In the Northern States it disappears at ths approach of winter and returns with the apple blossoms. In most parts of the Southern States it is quite familiar in winter, and comes boldly to the barnyard to glean its food.

In his report on the birds of the Northwest Dr. Coues notes two varieties of the hairy woodpecker; one *Picus villosus*, the other *P. Harrisii* and states that on this coast we have the latter, except in the upper region of the coast, where ths trend of the Rocky mountain range toward the northwest brings in the Eastern variety in Alaska. The habitat of the *P. Harrisii* extends westward from ths Rocky mountains to the Pacific. Specimens found in New Mexico and southern California ars slightly smaller than those of Washington Territory, but not notice ably so. The chief distinction between the two varieties of the hairy woodpecker is in the color of the wing-coverts. The wing-coverte of the *P. villosus* are profusely white spotted; those of the *P. Harrisii* being scarcely or not epotte with white.

THE HAIRY WOODPECKER.—(Picus Villosus)

Certified assay from the Alpha mine, Lake district, Mono, givee $301.08 eilver and $27.62 gold.

The West Indian insurrection is reported qnelled. Labor contracts caused the trouble.

The Mexican "Zona Liboa" is not abolished as was a short while ago reported.

A Bodie miner, grading for a cabin, has etruck a fine ledge of gold-hearing quartz.

Nearly 4,000,000 salmon egge were ehipped East on the 7th inst.

The Engineer.

Models for River Improvement.

According to a description which we read in the *American Manufacturer*, there is a most interesting display of models for the improvsment of ths Ohio river at the Pittsburg exposition. A wooden flums or canal has been built by ths exposition authorities, and supplied with a large stream of water from a steam pump. This canal, intended to represent the Ohio river, is used by the inventors and exhibitors of the working models to demonstrate the method of opsrating their various designs.

Mr. Brunot exhibits two styles of movable dam, one suitable for the upper lock of a canal, or other location in which there is considerable difference in the level of water above and helow the dam, the other for the lower lock of a canal, or for the bed of a stream where tbere need be no diffsrence in level. Each dam consists of a floating water-tight box or caisson, which is raised to closs the dam by its own buoyancy when emptied of water and filled with air, and sunk to open the water way when filled with water. A chamber of masonry or other material underneath the dam receives it when sunk. The only difference between the two dams is in the method of the emptying of water to raise the dam. In the first the water is allowed to escape to the lower level through a valve; in the second, there being no lower level, the water is pumped out.

Lieutenant Mahan exhibits a model of the Chanoine wicket dam. The principle of the Chanoins system is that a nnmber of wooden wickets, four or more feet in width, and as many feet in hight as may be necessary, according to the depth of dam, are placed side by side across the channel to be dammed. Each wicket is hinged to a movable cast-iron hrace or trestls, which braces are hinged to the foundation at the bottom of the dam. The braces are so adjusted that by tripping them the wickets can be made to lie flat on the bottom of the stresm. They can bs raised by a hooked rod either from a boat designed for the purpose or from a movable trestle bridge.

Mr. Discher exhibits a movable dam which has some resemblance to an ordinary hinged canal lock gate. The gate, however, is a hollow watsr-tight box, floating when filled with air, and movahls, and rendered stationary when brought into position for closing the dam by being filled with water.

Mr. Parsons, Mr. Wood, Mr. Smith and Mr. Duhois exhihit movahle dams which are all somewhat similar in principle. In these the up-stream and down-stream faces of the dams are built of boards or other material, and are hinged together at the top, forming together. when raised to close the dam a very flat letter A. The bottom of the up-stream face slides along a foundation prepared to suit, to open the water way, till the A hecomes entirely flatteued out, and the two faces lie in a horizontal plane at the hottom of the stream. The plans differ in the method of moving the sliding face. Mr. Wood and Mr. Smith use different kinds of mechanical gearing, while Mr. Parsons uses a hydraulic cylinder, and Mr. Dubois utilizes the buoyancy of the two faces of the dams to raise thsm.

Mr. Thompson's movable dam is a curious device. It consists in a revolving semi-cyliuder, whose axis is at right angles to the line of the stream. It revolves in a semi-cylindrical chamber at the bottom of the stream. When the dam is raised the semi-cylinder is revolved till ths cylindrical portion rises out of its chamber, thus forming a dam; to lower it, it is revolved till the flat portion is uppermost and on a level with ths bottom of the stream.

A Railway up Mt. Vesuvius.—At last there is a prospect of the railway up Mt. Vesuvius hecoming a reality within a not very remote futnre. The carriages on the railway will bs drawn, not by a locomotive engine, hut by a wire rope. The line will be double. The rails will be laid on an iron framework supportsd by pillars, also of iron. The pillars will bs six meters (a little over six and one-half yards) apart. According to the rsport upon the plans, it appears that the length of the railway up the mountain will be almost 919 yards. The station near the summit will be nearly 460 yards higher than that at the foot of the mountain, which gives the very steep gradients of ons in two. Ths traffic will be carried on by eight carriages, each having room for four persons; thess will be so distrihnted that while four are engaged in making the ascent the remaining four will be descending the mountain. The carriagee will be kept nearly 230 yards apart from one another. To guard against accidents, each carriage will be fitted with two newly-patented automatic brakes, which, should the rope happen to break, will instantly etop the carriage. The wire rope will be previously tested by a strain equal to 64 times the weight of the carriages; and the whole machinery will be set in motion by two eteam-engines of 12 horse-power each.

Railroad Enterprise in Australia.—English mechanical papers are awake to the fact that Australia has ordered nearly 1,000 miles of new railway. The *Colliery Guardian* says: Thie is the boldest stroke yet attempted by any Australian minister in the interesting work of railway construction; and, as snch, it appears to us to be especially entitled to notice. We

may remark that the consolidated revenus of Victoria, for the year ending Juns 30th, 1878, amounted to £4,488,803, showing a decrease of £24,934, as compared with the year ending Juns 30th, 1877. Yet, so confident is Mr. Woods, the Victorian Minister of Railways, of the elasticity of Victorian resources, and of ths stimulns which railways are to give to their development, that he has mapped out for construction a network of about 900 miles of new line. Most of Mr. Woods' predecessors in office have been content to propose 200 or 300 miles of new line at a time, but Mr. Woods has shown himself more energetic, and, if not mors sagacious, at any rate more ambitious and more enterprising. It should ho remarked that the income derived in 1877–8 from the Victorian Government railways presented an iucrease of £124,188, as compared with 1876–7, the increase being obtained with 164 additional miles of line in operation. At this rate, the railways of Victoria are rapidly increasing in produetihility and, as ths capital required for ths coustruction of a Victorian Government lins can now he raised npon the security of Victorian Government debentures at the relatively cheap rate of 4½% per annum, the development of uew sections is a comparatively easy task.

A Chance for American Bridge Builders. Great activity ie just now being shown in the Austro-Hungarian empire in the prosecution of all kinds of puhlic works, and especially of thoso in any way relating to the extension of the railway system of the country. Among others there is talk of the construction of an iron hridge over the Drave at Eszeg, to replace the present ferry, at a cost of 800,000 fls., which would be carried ont partly hy the government and partly hy the Alfoeld and Flnme Railway Company, which is domiciled at Pesth. It is also proposod to replace hy iron hridges all the wooden bridgee on the line worked hy the Alfoeld and Flume Railway Company and the Kaschau and Oderhurg Railway Company, etc., and the construction of thc proposed lines of railway on the military horders of Croatia and Slavonia is to he offered for puhlic anction—in fact, according to *Herapath*, one line has already been adjudged.

The Grand Canal of China.—This canal is likely to share the fate of the great wall. This water-way was constructed hy Kuhlai-Khan and his snccessors of the Yuen race, and ie 600 miles in length. There are 10,000 flat-bottomed hoats on this canal, and these are used in the transportation of grain. The *Echo* states that this great water-way is an enormous "white elephant," as it costs an enormous amount every year for repairs, the appropriation there, as elsewhere, not being entirely devoted to the purpose for which they are meant. Junks are delayed every month while channels are cut for their passage. This year, for the first time since the construction of the canal, the grain from Nanking, with the consent of the government, has heen forwarded by sea, and this fact has impelled the Peking authorities to consider the expediency of abandoning the canal as a commercial highway.

French Enterprise.—The *Railway Age* says: The French government is laying nut a very broad and gigantic scheme of railway construction, adapted to the wants of various sections. With the vast sum of $100,000,000, which it proposes to borrow every year for ten years, the ordinary lines of four feet nine inch gauge are to he increased and pushed into districts which are at present without them; next a meter gauge is to be introduced for ten productive districts; and finally steam tramways, with a gauge of two feet, six inches, are to he laid on most of the ordinary highways. The epeed on these lines is to be ahout nine and one-half milee an honr, and on the meter gauge about thirteen; the estimated cost is $12,800 per mile on tramways and $20,480 on the meter.

St. Gothard.—The work of tunneling the St. Gothard railway is being pnshed on with considerahle rapidity. A telegram from Geneva statee that on the Goeschenen side alone 1,000 men are employed inside the tunnel and 400 outside. Three hnndred wagon loads of earth are excavated every day, and in the daily blastings 600 pounds of dynamite are used. Equal energy is heing shown on the Italian eide.

Mine Working in Lapland.—Two Norwegian engineers have found that the problem of working minee in Lapland may he solved by a railway through the Lulea and Tornea valleys from the Bothnian creek across the mountains to the North sea, where coal can he procured from England. In winter, measures would he taken to prevent snowdrifts.

Steam Tramways in India.—A company, under government sanction, has been started to connect Darjeeling with the State railway by meane of steam tramways. The Maharajah of Bnrdwan has granted to the company a site for a terminns in Darjeeling.

Locomotive Gas Consumer.—According to the Springfield *Republican*, the locomotive gas consumer, on trial for the last few months hy the Southern road, is proving so euccessful that after a little further experiment it will probably be put on all the company's engines. The consumer destroye over one-half the gas which causes the smoke, so disagreeable to passengers, and saves 10% of the coal.

Useful Information.

Workshop Management.

Frederiek Smith, an Englishman, has written a book on this snhject in which he makes the following among othsr points, as deserihed in a review hy *Iron:* Not every one who owns or has charge of a workshop knows, or eares to know, npon what prineiplcs it should he conducted in order that success may accrue. Indeed, we do not hesitate to say that the incompetents are largely in the majority. Too often proprietors, so that they get an income which means a handsome interest on capital invested, au easy life, and soms dignity, do uot troubls themselves to inquire closely how the details of their busiuess are being carried out; and as a result petty tyranny often flourishes, and frequently dissimulation and dishouest practices grow apacs. Ths teaching that employers owe to their workpeople ths duty of watching their condition is not sufficiently recognized, and the consequences are found in diffidenee and contensions. Now, to ignors this duty is unwise as well as improper, for where the employer evinces little or no interest in his people—is rarely seen hy them, and more rarely heard as counselor—the helief forces itself that there exists indifference and selfishness, and corresponding qualitics spring up on the other eide. Demoralization is then rapid. "Give the least you can for the most yon can get" becomes a guiding principle. What follows is depreciation of profits, and whore drastic remedies are not applied crippling emharrassment often rears its head. If employers, then, desire the maximum of henefit from their husiness, among other things their knowledgc of their workshops ehould he intimate and their interest in the lahorers in them active. To the advocacy of this, much of Mr. Smith'e hook ie devoted. But the author also finds ample opportunity for scathing condemnation of unworthy foremen, who connive at dishonest practices, and, hy showing they have no self-respect, set the example of impropriety to those whom they are entrusted with the care and guidance of. The capahle foreman and his qualities are, of course, likewise coneidered. He should he honest, honorahle, respecting and respected, with his conscience ever for his guide, and intelligent enough to exercise his hrains when difficulties present. Of course there are very few such; hut only euch are fitted for the position; and an employer who lacks the foresight enabling him to detect such qualities is minue a power he can ill spare.

Tin Coating.

For the purpose of coating metals with tin, Messrs. Neuburg & Co., of Vienna, propose to use a zinc and carbon battery. The inner cell containing the carhon is half filled with chromic acid, and the outer cell containing the zinc is filled with dilute sulphuric acid. The articles to be coated with tin are put into a hath composed of protochloride of tin and cream of tartar, with or without chloride of tin. The proportions of these ingredients are: Eight parts of protochloride of tin, 16 parts of cream of tartar, and two parts of the chloride, if the latter is used. When it is present the tin coating is effected more rapidly, whereas when the bath is composed of protochloride of tin and cream of tartar only, the tin coating is very white, but is not produced eo rapidly as when the chloride is used. These ingredients should be dissolved in about 100 gallons of distilled water. The black plates are first "pickled" in any suitable manner, and then immersed in the above-described bath or solution, and are allowed to remain in the same for a longer or shorter time, according to the thickness of the deposit or coatiug of tin required on the plates. While in this bath the plates or other pieces to be coated are connected by a wire with the positive end of the battery, while the negative end of the battery is connected with a piece of tin hung in the same bath. When the plates or other pieces or articles have been sufficiently coated with tin, they are held over a fire in order to give the tin a lustrous appearance.

Note on "Blowing Off" Steam Boiler.—In a French essay on the care of steam hoilers we find a note on the advantage of cooling off the arch after etopping and before "hlowing off." It is as follows: Those who possess externally-fired hoilers working only hy day have all observed that the fire being covered at night, and the doore closed, the pressure rises dnring the night, often sufficiently to open the valves. This ehows that the masonry, being at a much higher tempsrature that the hoiler which it envelopes, imparts to it some of its heat. The same effect of heating the boilers by the masonry is produced to a less degree, it is true, but, nevertheless, to some extent on the outer jacket of internally-fired boilers. It is consequently injurious to empty hoilers soon after having stopped them, because after emptying the plates would be heated hy the action of the masonry. It is well to admit a current of air through the flue some honrs after the stoppage of the generator, and not to empty it before the flues have become cooled to a temperature below 150°. When the flues are not too hot, no serious inconvenience is experienced in emptying the boiler under pressure. We do not say at high pressure, as for a boiler the pressure of which would be 5 kilogs., the temperature of the water being 152°, a great quantity of steam would he generated dnring the process of emptying; we think that at a pressure at 1 kilog. the hoiler could vsry well he emptied.

In internally-fired hoilers, as thero is no masonry to cool in the furnace tubes, it would he preferahls to admit tho current of air intended to cool the masonry hehind the hoiler, as in this case the furnaces would not be cooled more rapidly than the jacket. We have sometimes seen owners empty their hoilers almost immediately after the fires have heen extinguished, clean them with cold water as soon as they were empty, and keep up a current of watsr so that the workmen might work there. Boilers of small dimensions sometimes resist this treatment, but in largs hoilers it will hs seen that unequal contractions must taks plaes which hurst ths rivets.

Introducino the Electric Light.—We read in an exchange that one of Philadelphia's largest carpet manufactories has recently put in the electric light to illuminats its floors, and the devics is a complete success. It consists of a Brush dynamo-electric machine of 12,000 candle power, arranged to give four separats currents, each running an electric lamp of 3,005 candle power. Two of the lamps were placed on the third floor and two on the fourth floor of ths immense huilding, and when the engine was started up the machine started at the same time, and without the slightest manual interference the lamps flashed ont their light in all its magnificence. The effect was most hrilliant. The rooms were flooded with a pure white light like the light of the sun, and it streamed out at all the windows, illuminating houses and streets for a long distance in every direction. The light was very uniform and steady, free from the flickering, and, considering its enormous illuminating power, was unexpectedly soft and endurahle to the eyes. Estimates were made as to the amount that the light furnished by this apparatus would cost if used hy the carpet company, as it was used on this occasion, and it was ascertained that the total cost from the whole light from the four lamps, including the items of consumption of carhon in the lamps, interest on the investment and wear and tear, would not exceed 30 cents an hour. The light produced was photometrically equal to 800 gas burners, hurning five feet of gas per hour each. This amount of gas would cost $8 per hour.

A Bad Climate for Needles.—It appears that now the English have succeeded in mounting Cleopatra's needle they have a new trouhle, namely, that of preserving it from red-hot lightning and disintegrating frosts. *Iron* eaye: Now that the ohelisk is safely and permanently established on its last resting place, there are certain precautions that must be taken to preserve it. The danger from lightning is not small; but a wire hrush, such as projects from the head of his Grace of York on Carlton terrace, would detract greatly from the appearance of the monument. A bronze cap on the apex, with a thin rihbon of the same metal carried into the river, would, however, without defacing, effectually protect it from the electric fluid. The danger from the chemical elements in the London atmosphere is more immediate. The surface, evcu of the Paris obelisk, is reduced to kaolin, and the air of London is likely to act still more powerfully. There are, however, applications that have heen proved quite efficient on the walls of the Legislative palace and elsewhere; and they cannot be too soon applicd, for it is alleged that the surface of the needlc already scales very easily, and that the external condition of the mass is such as to render it very liable to be disintegrated hy frost.

A Rose by any Other Name, etc.—At a recent meeting of an English scientific society it was stated that "otto of roses" has been derived from coal tar.

Good Health.

Alcohol in the System.

We find in *Hall's Journal of Health* a vigoroue article in reply to an English review which upheld alcohol as a food, etc. The article is long and forcihle, hut we have space only for the general summing up, as follows:

If alcohol is not a poison, hut food; because alcohol gives force, muscular power—then, arsenic is not a poison, but food, bscause aresnic gives force, muscular power.

As nature has formed no element in its purity, which element in large dilution is necessary to health, we conclude that such element in its purity is not essential to health.

As men have lived in perfect health without alcohol, the use of alcohol cannot add to that health, because a man cannot be better than well.

As we know of no article which contains hydrocarbon largely, which would not destroy life, if used alone, not even sugar; so we may conclude that alcohol, which does contain hydrocarbon largely, will destroy life, if used alone.

If any elementary snbstance in its purity detroys life, if used alone, it is reasonable to conclnde that the only safe methed of using any elementary substance is, in using it in the proportion in which nature has combined it with other materials: therefore, that however essential to existence hydrocarbon may he, it is not healthful or safe to uee it in its concentrated, artificial combination, but only healthful and safe in deriving our eupplies of it, as contained in our natural food. Therefore, wo consider it established, that alcohol is not essential to health; that it is not promotive of the health of those who are well; and that in proportion as it is used largely, or alons, in such proportion is it, like all other elementary concentrations, certainly destructive of health and life together.

A New Treatment of Tape-worm.—Malsfern oil, kousso, and the hark of the pomegranate root are the anthelmintics usually employed to oxpel tæniæ, hut their action is violent, and often uncertain. A careful inspection will always enable the medical attendant to discover the ova and fragments of ths parasite in the stools, and when this has heen done we have a simple and effeetual method of insuring a cure. From the results of numerous experiments M. Bouchut has asscrtained that not only ascarides, but fragments of tæniæ, when placed in a weak alcoholic solution, containing 1.35th of amylaceous pepsine, are digested hy ths fluid in the course of twelve hours. Wo thus ohtain an artificial digestion of the animal matter exactly similar to that which ensues when meat is treated hy the same process. On submitting the conclusion drawn from his experiments to the test of practice at the Enfants Malades, M. Bouchut found that ths solution of pepsine was eminently sucessful. If his experience he confirmed a valuahle addition will he made to adult as well as to infantile therapeutics.

Colic Cured by Standing on the Head.—Dr. D. L. Phares, in *Trans. Mississippi State Med. Association*, 1878, recommends as a prompt and effectual cure in many cases of colic, to place the patient in an inverted posture. Some cases which have resisted the ordinary treatment for hours and even days, have hy this simple means heen relieved and permanantly cured in from one to five minutes. Sometimes relief appears to he afforded from the escape of air. In other instances, the air in the howels changes its place, to the relief of the patient. Some movement of gas in the intestines appears to he essential to relief hy this method. Of course it is only flatulent colic which can be permanently relieved hy this treatment. The *Pacific Medical and Surgical Journal* says: The confidence with which Dr. Phares asserts the success of the plan entitles it to a trial. The treatment could be easily applied in popular practice. The patient might at least he held up hy the heels till the arrival of the doctor.

Another Cure for Corns.—The safest, the most accessihle, and the most efficient cure of a corn on the toe, is to douhle a piece of thick soft buckskin, cut a hole in it large enough to receive the corn, and bind it around the toe. If, in additiou to this, the foot is soaked in warm water for five or more minutes every morning and night, and a few drops of sweet or other oily substance are patiently rubbed in on the end after the soaking, the corn will almost infallibly become loose enough in a few days to be easily picked out with the finger nail; this savcs the necessity of paring the corn, which operation has eometimes been followed with painful and dangerous eymptoms. If the corn hecomee inconvenieut again, repeat the process at once.

Brain Work and Longevity.—The oldest living chemist is eaid to be Michel Eugene Chevreul, a Frenchman, born August 31st, 1786, and consequently just entering upon his 93d year. He has been for many ycars a resident of Paris, where he still continuee his studies, in full possession of his senses, the vigor of his mind being wholly unimpaired. The production and usc of colors has been a specialty with him, and the durability of the colors in the Gobelin tapestry is said to be due to his discoveries, by which hundreds of persons have been enriched, while he, as usually happens, remains poor. Chevruel serves to corroborate an opinion often expressed—that of all the classes that hahitually employ the hrain, men of science live the longest.

Plants as Air Purifiers.—Mr. Girdlestone says, in a little pamphlet lately published: "If a number of flies he placed in a glass case (such as an aquarium), with plenty of sugar to feed on, and the case be then made air tight, they will in a few daye have so poisoned the air with their hreath that they will die. But if some living plants, as well as sugar, are shut in with them, they will continue to live for months, with active appetites and in perfect health; the plants removing the carhonic acid and ammonia (both of them poisons to animals), and returning to them pure oxygen and nitrogen instead."

The Appetite of Temperate People.—We read that in Frankfort, Germany, the hotel keeper found that the members of the Peace Congress, who were mostly tetotallers, ate so much of solid food as to create an unheard of deficiency in certain dishes, as compared with an equal numher of his countrymen, who revelled in wines, hrandies and lager-heer. If this proves anything, it shows that temperance secures a good appetite.

Turpentine as a Disinfectant.—Mr. Thos. Taylor, Microscopist of the Department of Agriculture, has an article in the Washington *Evening Star*, from which we take the following: "Turpentine I also found to he a powerful deodorizer. A tablespoonful added to a pail of water will destroy the odor of cesspools instantly, and in the sick chamher will prove a powerful auxiliary in the destruction of germs and bad odors."

SAN FRANCISCO:
Saturday Morning, Oct. 26, 1878.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Mines and Works of Almaden—No. 6: Improved Pulley for Wire Rope Tramways, 257. The Week; The Study of the Natural Sciences; The French Treaty and our Productive Interests; The Academy of Sciences; Gold Mining with a Pump, 264. Artesian Wells—No. 3, 265. Patents and Inventions; Notices of Recent Patents, 269.

ILLUSTRATIONS.—The Almaden Mines, 257. The Hairy Woodpecker, 262. The Artesian Wells in San Francisco, 265.

CORRESPONDENCE.—Carson City, Nevada.—No. 2, 258.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado and Idaho, 261-263.

MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 260.

NEWS IN BRIEF on 269 and other pages.

MECHANICAL PROGRESS.—Sugar-Making Machinery; Steel as a Building Material; Thum's Furnace for Galvanizing Iron; Testing Iron and Steel with a Falling Weight; The Point of Greatest Strength in Metal; Steel in Ships, 259.

SCIENTIFIC PROGRESS.—A New Derivitive from Opium; A Martyr to his Theory; A New Dental College; Platinum Plating; A Pigeon Living Without a Brain; Mental Logarithms; Composition of Mr. Darwin's Drosera; The Liebig Memorial; Liberality to Science; Peculiar Action of Petroleum; A Russian Technical Laboratory; Peruvian Coal, 259.

THE ENGINEER.—Models for River Improvement; A Railway up Mt. Vesuvius, Railroad Enterprise in Australia, 262. A Chance for American Bridge Builders; The Grand Canal of China; French Enterprise; St. Gothard; Mine Working in Lapland; Steam Tramways in India, 263.

USEFUL INFORMATION.—Workshop Management; Tin Coating; Note on "Blowing Off" Steam Boilers; Introducing the Electric Light; A Bad Climate for Needles, 263.

GOOD HEALTH.—Alcohol in the System; A New Treatment of Tape-worm; Colic Cured by Standing on the Head; Another Cure for Corns; Brain Work and Longevity; Plants as Air Purifiers; The Appetite of Temperate People; Turpentine as a Disinfectant, 263.

MISCELLANEOUS.—Improved Gold Washer's Bowl; A Fair Hint from Colorado; A Model School of Mines; A New Dry Washer; Nickel Smelting in Norway, 258. The Mines and the Courts; Lower California; Lixiviation Versus Amalgamation; Refrigerator Shipments; The Hairy Woodpecker, 262.

NEW ADVERTISEMENTS.

A Practical Treatise on Casting and Founding, E. & F. N. Spon. N. Y.; Joseph C. Todd, Engineer and Machinist, Patterson, N. J.; Assessment Notice—Mount Jefferson Mining and Milling Co., J. W. Clark, Sec'y, S. F.

The Week.

Forebodings of a panic in England have caused some anxiety in business circles. The fall in silver—bar silver lower in London, October 16th than for over two years—brought about in part by the demonetization effected in Germany, goes hard with English houses trading in India, the hills against that country being paid in silver. The failure of the Bank of Glasgow has caused most distressing depression, so that the matter is hardly made worse by the discovery of a further deficiency of £60,000, not shown on the first balance sheet of that concern, published since the crash.

The inauguration of Sherman's new system for buying fine silver was postponed by the late tornado, the telegraph wires were so demoralized. The amount of silver purchased per week is limited to 400,000 ounces. The bids will be opened at a stated time so that no seller can find out the prices of earlier bidders. The system will probably result in the depression of silver. The Government will certainly be bettered by it.

THE Franklin M. Co. of Dutch Flat exploded a blast of twelve tons of black powder in their claim on the evening of Oct. 23d, doing good work, as well as giving the town a shake-up equivalent to an earthquake.

The Study of the Natural Sciences.

The development of the natural sciences may be said to be the peculiar feature of the present century. We are all sufficiently acquainted with the benefits which science has scattered with a lavish hand among us, but few of us realize the increasing difficulty of the study, and the need of appliances of every kind to make its development continuous. The study of the natural sciences as a part of a liberal education is a growth not of a century, but, at least in this country, of only a score of years, and many of our college men who were educated 20 years ago in our old-time American colleges have but a faint idea of what the study consists of at the present day.

The study of the natural sciences is useful to the world in more than one way. In the first place, as a means of mental training; next, as a means of increasing the amount of human knowledge; and lastly, as a means of better developing the practical arts. As a means of mental training it is unequaled, since it brings the student face to face with nature, with the forces and the facts of existence. Such an intimate personal contact with the real never fails to stimulate the faculties of the mind. There is no logic so inexorable as that of nature; there is no mental training equal to its conscientious study. In the next place the study of natural science leads, by a process of natural selection, to the development of such students as are fitted by nature for the highest of privileges, the extension of the limits of human knowledge. And finally it is only by the thorough study of science that progress in the practical arts is at all possible.

Now, while all of us admit, in a general way, the importance of this study, there are but few of us who understand at all the many difficulties which surround it. The time was, and was not so long ago but that many of us may remember it, that our single college professor, with his air pump, his electric machine, his crucible and retort, could take in all the sciences, and teach besides, perhaps, a little rhetoric, or moral philosophy. That day is gone, never, we hope, to return. Science has grown so rapidly in the last score of years (thanks to the untiring labors of many heads and hands) that even of the most recent of the sciences no one man is master, much less able to make the proud boast of Von Humboldt that "all knowledge is my province." Science can to-day be profitably studied only with the aid of all the appliances which large laboratories, collections, libraries, and learned professors can furnish.

We have been lead to make these remarks, because we find there is a great deal of misunderstanding upon this subject, even by some of our leading citizens, who, educated in the old way, have been too busily engaged with their professions and business to become acquainted with these facts. There is an important corollary from the above conclusion, that the study of the sciences needs apparatus, collections and instructors for its successful accomplishment. That is, the amount of money which is spent upon institutions devoted to the higher education, is best utilized when it is concentrated upon one worthy institution, instead of being divided among a dozen others, all of which are necessarily of the lower order.

In the latter case apparatus is necessarily duplicated, it becomes impossible for any one to have instructors of proper ability, or to allow them to devote themselves to one department, as is absolutely essential in teaching science at the present day. The only way that we in America can fully realize the benefits which science is ready to bestow upon us, is to follow out as nearly as our different circumstances permit, the idea of the university system which has grown up in Europe. We in California have made a start in this direction. As to our success, we shall speak in an other number.

BULLION SHIPMENTS.—Extra, Oct. 17th, $5,430.27; Hackberry, Oct. 17th, $9,132.00; Manhattan, Oct. 16th, $10,600.00; Bodie, Oct 14th, $12,812.21; Northern Belle, Oct. 14th, $3,315.58; California, Oct. 19th, $92,207.61, total to date, $186,385,07; Con. Virginia, Oct. 19th, $26,402.99, total to date, $77,113.24; Independence, Oct. 14th, $12,027.40; Jefferson, Oct. 16th, $1,958.47; Leopard, Oct. 16th, $9,200; Bodie, Oct. 17th, $12,000; Tyho Con. Oct. 14th, $7,553.64; 18th, $7,781.92; total this month to date, $33,949.16; Navajo, Oct. 14th, $7,520.02; 21st, $7,300; Christy Con., Oct. 22d, $4,435. Received at Salt Lake: Ontario, Oct. 11th, $6,250.42; 12th, $4,608.87; 14th, $6,184 73; 15th, $2,886.75; 16th, $2,875.04; 17th, $2,034.56; Silver Reef, Oct. 12th, $5,577.33; 16th, $11,972.79; 17th, $10,475.52; Butte, Oct. 14th, $10,384.65; Indian Queen, Oct. 14th, $5,089.21; Hillside, Oct. 19th, $5,700; Northern Belle, Oct. 19th, $7,633.74; Oriental Con., Oct. 23d, $5,160.60.

ON FILE.—"The Silverado Mines," "Cap;" "The Niagara G. S. & C. M. Co.;" "The Golden Fleece G. & S. M. Co.," W. G. A.; "Sonora, Mexico," M.; "Mining Patents to Foreigners," L. C.

FIVE Rocky Mountain bison, of the kind so rapidly becoming extinct, were recently seen in the neighborhood of Whiteley Peak. One of them was killed.

The French Treaty and Our Productive Interests.

We own we never could quite understand why it was our Chamber of Commerce fell in so quickly with the treaty schemes which the clever Frenchman, M. Chobreau, announced in this city some months ago. Whether they only intended to give the foreign gentleman a most courteous reception, and unwittingly gave him material to use against our productive interests, or whether, as merchants, they only caught one idea, and that is, that the smoother the path for the introduction of commodities the easier the trade. However this may be it matters little, for our wine producers are moving vigorously to counteract whatever of prestige the treaty-hearer gained from his San Francisco endorsement, and to place the wine interests before the country in its true light. At least three notable meetings have been held—the first at St. Helena, the second in this city, and the third at Los Angeles—at all of which action was taken showing that the proposed treaty with France would be fatal to our growing wine interest, and hand over to the French all the advantage in the contest which we have been waging with them, with the hope of victory for our side. At the San Francisco meeting of the State Vinicultural Society, in addition to affirming the right of the industry to a continuance of the government protection under which it has grown thus far, measures were taken to enlist all vine-growers' societies throughout the country in a united effort to show up the proposed treaty in its true light as affecting our productive interests. We cannot but believe that the direction of public attention to the matter will prevent the ratification of the proposed treaty; for although we have a high idea of the French as producers of different articles, we do not want any more of their low grade wines in this country, nor do we want their free competition in the markets which we are endeavoring to build up in this country for California dried fruit and other local productions. We pay the French enough money already for articles which our producers should supply. There is every reason why the amount should not be increased. All our future in some lines of production, which we are now developing, depends upon the fostering which is now received at the hands of the government.

A Useful Book on Mines and Mining Matters.

There has just been issued by the publishers, Messrs. Francis & Valentine, a book entitled the "Annual Mining Review and Stock Ledger." It contains some 300 pages, and is devoted to a consideration of mining interests and properties on the Pacific coast. The main feature of the book consists of a Mining Directory, in which all the principal mines in California and Nevada, together with many situate in other sections of the country are briefly, and in some cases quite fully described. Where but little or no developements have been made on the mines, or where the owners have not cared to have them described in detail, the name and site of the property, with list of officers, locality of principal office, time of annual meeting, number of shares, amount of assessments levied, dividends declared, etc., are given. As this information is obtained from official sources, and therefore supposed to be correct, this book is likely to be largely consulted as a work of reference, for which purpose the alphabetical arrangement of the matter renders it exceedingly convenient.

This volume also contains a description of the several San Francisco Stock and Exchange Boards, with a list of members, constitution and by-laws, rules of order, etc., which also being authoritative may be fully relied upon. What forms an attractive feature of this work is the biographical sketches of many of our more prominent mining men and stock operators, and which, embodying as they do the leading facts and incidents connected with their busy lives, will interest a large circle of readers. A number of well written essays on bullion production, the remonetization of silver and kindred topics, and the several articles on the mines of California, Nevada, Idaho, Arizona, etc., adding materially to the value of the book.

A matter of general interest is the decision of the Commissioner of the General Land Office with regard to the width of all lode claims. A section of the Revised Statutes provides that no claims shall extend more than 300 feet on each side of the vein at the surface. The Commissioner says. "When the vein outcrops at the surface, there can be no question as to the point from which the lateral measurement must begin; but when it is discovered that a shaft develops the vein at some distance below the surface, and the location does not determine by any further prospecting that the nearest actual surface point is elsewhere, and the fact does not otherwise appear, I am of the opinion that the point of the vein so discovered must be assumed to be the middle of the vein, and the lateral measurement be calculated therefrom."

THE attempt to introduce cat fish into California waters is meeting with decided success.

Gold Mining with a Pump.

Our readers will remember the description which we published not long ago of the new gravel pump, invented by E. Moreau, of this city, and belonging to the American Mining and Dredging Company, and the report of the trial made with one of said pumps, of small size.

At the Union Iron Works, in this city, a large pump of the same kind is now being built, which will be shipped, presently, to Barbacoas, in South America, for working the auriferous gravel deposits, which are known to be very rich, in certain rivers there. This machine has a suction pipe fourteen inches in diameter, and will be driven by an engine of 100 horse power. The company claim, on the basis of working tests in this city, that such a pump has a capacity of raising 32,400 cubic yards in twenty-four hours, one-half of which may be solid matter, cobble-stones, gravel, sand, etc., if the bulk of the suction pipe be kept near the material to be raised. This claim, as to capacity, will not seem unreasonable when compared with the report, in *Engineer*, of a trial of a centrifugal pump, at the International exhibition in London, in 1863, which pump had a runner of the same size, moving at the same velocity, and raised 91 tons of water, 21 feet above the surface, per minute, or 131,000 tons in 24 hours.

According to Dr. Young, water moving with a velocity of 900 feet per hour, tears up fine clay; at 3,600 feet, carries fine gravel; at 2 miles an hour, moves pebbles as large as hen's eggs. In such a pump as we have described, running at 200 revolutions per minute, the velocity of the water will be about 20 miles an hour, and will tear up clay and carry cobble-stones as easily as chips. Any solid material, when once in the line of the flow, will be held in its place and forced through the pump at the same speed as the water. Mr. Moreau's pump differs from all other centrifugal pumps, in that it has no valves, contractions, nor obstructions of any kind, giving a continuous flow, free from stoppages, heating, or other cause of trouble. The company proposing to operate in South American rivers, have examined many dredging machines, in this country and abroad, and have finally selected the Moreau pump, as offering better results than any other. A company has recently been incorporated in this State for working the bed and bars of Feather river, at Oroville, with similar pumps.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, Dr. Gibbons in the chair. The following donations to the cabinet were received: From J. P Moore, Indian skull, from mound at San Rafael; from W. B. Heilings, reptiles, from Phœnix, Arizona; from James D. Hague, samples of guano, from Malden island, South Pacific; from J. R. Scupham, ores from 2200 level, Sierra Nevada mine, and from Northern Light mine, Shasta county; from Eichelroth, head of mountain sheep, from Sierra Nevada range. Hugh Hittel, M. D., was elected resident member. Mr. W. N. Lockington read a paper on "Specific Names," and also described two new species of fish. Dr. A. B. Stout presented 25 geological and mineralogical specimens from Bodie, California. He exhibited a map of the district and charts showing ideal sections of the mountain in which the mines are situated. He also gave a lecture on Bodie district, describing its geological conditions, etc., and in his ideal section put veins enough in the mountains to make all the miners hearts rejoice. He also brought forward some very startling theories on the formation of quartz veins, and the occurrence of gold, proving the old adage of the shoemaker doing better by "stieking to his last," for if he had lectured on ethnology, which is a specialty of his, and not taken up geology of which he apparently knows very little, the audience would have derived more benefit from his remarks. He claimed the veins were of volcanic origin and that the gold had been evaporated and then condensed in globules in the veins. The reports in the daily papers were to the effect that the subject had been referred to a committee of 15 for consideration, which was probably a reporter's joke. The fact was that one member called attention to the fact that they did not find gold in lava from volcanoes, and another objected to having any such theories as those advanced published as if sanctioned by the Academy. To the latter, the Secretary stated that the Publication Committee took charge of such things and never permitted the publication in the proceedings, of any theories advanced by persons dealing with subjects, or which in the judgment of the committee, they only had superficial knowledge. Dr. Stout's remarks elicited some surprise among those present who had knowledge of mining affairs, more especially his handling of some of the mining terms.

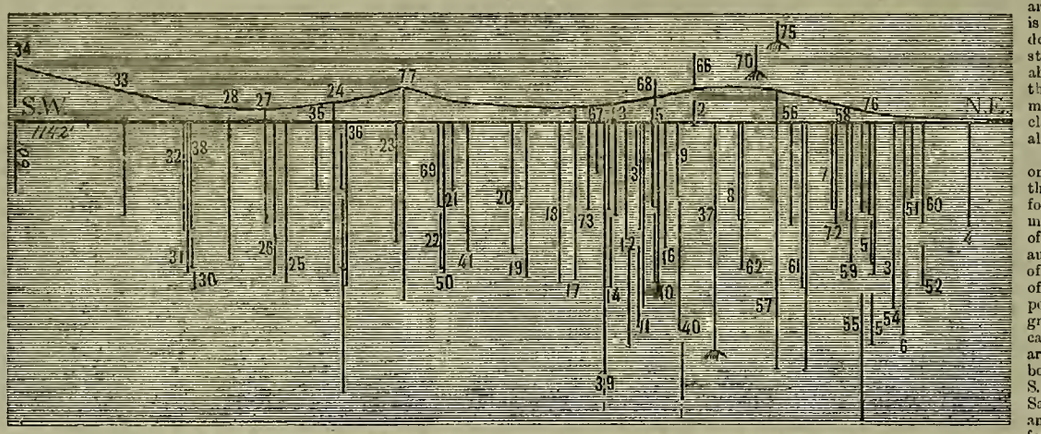
THE steamer Mohave arrived at Yuma from Ehrenberg on Oct. 23d, bringing 10 tons of copper ore and 6 tons of wool for San Francisco, and 28 tons Castle Dome ore for Oakland. All went forward by Southern Pacific R. R.

DURING a snowstorm in the Wahsatch mountains, two miners were carried on a snow-slide, over a precipice 500 feet deep. They escaped with only a few bruises.

Artesian Wells.—No. 3.

Fig. 5 shows the profile of the city on a line passing through 16th and Howard, and Market and First, together with the depths of some of the wells, below the datum of the city levelling. As there are many wells in the Figure not shown in the map published two weeks ago, it will be necessary to rapidly state the localities of some of these. No. 52 is on Beale street between Market and Mission; 53 is on Fremont between Howard and Folsom; 54 is near the corner of Fremont and Misson; 55 is on First between Mission and Howard; 56 is on Second between Howard and Folsom; 57 is on the block bounded by Market, Mission, Second and Third; 58 is between Sutter, Bush, Montgomery and Sansome; 59 is between Bush, Pine, Montgomery and Kearney; 60 is between Washington, Jackson, Kearney and Dupont; 61 is between Post Sutter, Montgomery and Kearney; 62 is near the corner of Dupont and O'Farrell; 66, Sacramento and Polk; 67, Van Ness Avenue and Sutter; 68, Bush and Larkin; 69, Van Ness Avenue and McAllister; 70, Laguna and Filbert; 72, Lombard and Gough; 73, Bryant and Fifth; 75, Polk and Broadway; 76, Market and First; 77, Folsom and Ninth. Beyond the profile the land rises, as a general thing. In front of it the land is generally lower. Wells, 70, 75 and 37 strike rock. Wells 39 and immediately below 40, are the deepest, running out of the limits of the Figure.

The *Alta* questions some of the figures given in the first two articles of this series. The possible number of wells bored in San Francisco was given at 1,500. It is suggested that this number was a misprint for 150. The estimate 1,500 was taken from the *Bulletin* of July 20th, but not without our having reason to believe that it was correct. Mr. Delaney says that he can answer for 1,000 wells in the city. Another well-borer has made at least 300; and it is known that many others have bored artesian wells here. The estimated capacity of the San Francisco artesian wells. 15,000,000 gallons per day, was also taken from the *Bulletin* of the same date. It is not an unreasonable estimate, as may be seen by referring to the *Bulletin;* nevertheless it was not indorsed in our articles. It is not unlikely that much of this water is allowed to waste. The *Alta* says, in support of the suggestion that this estimate is a "grave mistake:" "That amount (15,000,000 gallons per day) would be 50 gallons for every inhabitant of the city, or enough for the entire supply; whereas, four-fifths of the people depend upon the Spring Valley Water Works." This argument might lose some of its force if it were known that these four-fifths of the people who have depended upon the Spring Valley water have had, at times, mingled with the drainage of Pillarcitos canyon, a taste or so of water which comes from not quite so near the surface as the origin of the Spring Valley supply is generally supposed to be. If the Spring Valley Water Company have bored artesian wells to serve in augmenting their supply to the city, an additional reason exists for confidence in the ability of the strata underneath us to yield sufficient quantities of good water. The *Alta* says: "As a general rule, in the city as in the interior, the probabilities are that the artesian auger will not find water; or, in other words, by far the greater part of the area does not contain artesian water in a sufficient quantity to be of practical value." We do not think this is sustained by the facts.



PROFILE THROUGH SIXTEENTH AND HOWARD, MARKET AND FIRST STREETS.

Where an Artesian Well will be Successful.

In attempting to form some judgment as to whether or not artesian well boring will prove successful in a given locality, the general principle on which artesian wells depends must be borne in mind. Water falling on the earth as rain or snow or whatever, is disposed of in one of three ways: Part flows rapidly over the inclined surfaces, collecting in rills, and rivulets and rivers; part sinks into the earth; part is evaporated. That which disappears into the earth continues its course through permeable material until it meets with some impermeable obstacle. If this obstacle be a rocky cavity the water trickles into it, filling it up until some crevice is found through which the water can continue its always downward course.

If the obstacle met with be the rocky sides of some old watercourse long covered by material washed down its sides or carried into it by other means, the water follows the rocky incline to the bottom of the old channel, and runs down this, to appear at the foot of the old ravine in springs, or to meet other impassable obstacles, and collect in the reservoir furnished by the old river-bed, until it again finds outlet.

If the obstacle be an extended and somewhat regular stratum of impermeable material the water will run along upon it, seeking the lowest portion, and filling up the space or the porous material above the stratum until again some outlet is found. If the impermeable stratum has beneath it more porous material and below that again a similar impermeable stratum, and if the two are bent in such a way as to present their edges upwards so that the percolating water has access to the porous "filling," then the two together form a kind of U tube, which may become filled with water, the water at the bottom being subject to pressure corresponding to the hight to which it has risen in filling the tube. The water so caught in porous matter between impermeable strata continues in its "tube" until some break is found, and if no extensive break is met with there is a constant tendency for the water to force its way, under the influence of the above-mentioned pressure, through the upper stratum of the tubes and to appear in springs such as are found often in the center of valleys, at considerable distances from hills. This is likely to be the case only when the water-bearing strata do not reach to a great depth. When the strata are deep they may become swollen with water, having perhaps no outlet, or an outlet at great distance from the outcrop, as, for instance, under the ocean. In the latter case the strange phenomenon of fresh-water springs in mid-ocean occurs.

Considering then the origin of artesian supplies, it is seen that in determining a place for boring, three general questions must be noticed: The configuration of the country, in the locality, the character of the material occurring in the neighborhood, and the climate.

Configuration of the Country.

In studying the configuration of the country, much depends upon whether the aim is to obtain a comparatively shallow or a deep well. As a general thing the shallower well will yield a smaller supply of water than the deeper, and, very naturally, a smaller area of land need be considered and greater attention paid to the configuration in the more immediate neighborhood, when a shallow well is wanted than when a deep well with a probably great and invariable supply is the aim. A sufficiently good, though incomplete, illustration of this may be found in San Francisco. The Mission hills stop short of the end of the peninsula, leaving the northern part to the sand drifts and lower hills of different formation. The Mission hills are furrowed with numberless little canyons, which, in the rainy season, collect the water and send small streams down to the lower portions of the peninsula. Now, the surest place on the peninsula to bore an artesian well for a moderate supply only, is on the low land opposite and near to the foot of one of these little canyons. If larger and more reliable supply of water is needed, boring had better be made not so close to the hills, but nearer the bay, in the little valleys, as Hayes valley, or between Rincon hill and Ninth street hill, or south of Ninth street hill towards the Mission. In boring these, there is taken into consideration the configuration of greater area than in the previous case. When still greater supply is sought for, and boring is carried into the rock underneath the city, then our petty hills no longer enter the problem, but the dip and condition of strata that may extend eastward under the Coast range and outcrop in the Sierras, demand attention. Another illustration may be drawn from a part of California where few artesian wells have been bored. In parts of Tulare valley the country is covered with low, sandstone hills. These hills are parts of what was once a continuous deposit of strata, covering these portions of the valley, and, where not horizontal, rising gently towards the mountains to the east. The hills were formed by the washing away of parts of this deposit, in some places the washing having been carried so far as to lay bare the granite underlying the sandstone. The sandstone is of the tertiary age, and under favorable circumstances, artesian wells would be expected to prove successful in it, especially as it shows a gentle decline from the mountains. Now, as in the former illustration, in choosing a place to bore a shallow well for a moderate supply, the low hills, the little valleys which they form, and the little canyons on their slopes, would be considered; while in prospecting on a larger scale, the hills would be in part ignored and the broad deposits extending all over the country and rising towards the mountains, would require the larger share of notice.

Shallow Wells.

With regard to the selection of a place to bore a shallow well, for a moderate supply, enough has perhaps been said. At the foot of canyons and in the lower parts of small valleys the boring may be made with most confidence. An almost sure indication that a well will be successful, is the occurrence of springs in the neighborhood.

Deep Wells.

David Dale Owen, in the report of a geological reconnoisance of Arkansas, made in '59 and '60, gives three conditions, which are necessary to the successful boring of artesian wells: First, the fountain-head must be higher than the boring; second, there must be a general dip of the surface from the fountain-head towards the well; third, there must be alternation of porous and impervious strata. These are all self-evident. The first two illustrate well the popular idea of the best place for boring wells. A valley is par excellence the ideal location for a well. But "valley" need not imply the neighborhood of hills. On the contrary, the vaster the tracts of low land, and the more widely separated the hills which form the "valley," so long as the necessary conditions of strata are fulfilled, the better the chance for a deep well to obtain a large and lasting supply. No hills need be in sight, and their absence should not discourage the water-prospector. The larger the circumference of the rim surrounding any valley, the greater, other things being equal, the surface exposed for the catchment of water.

The most favorable condition of strata, as to inclination, is found where they dip on all sides from the rim to the center, forming a basin. They may dip towards an axis, forming a trough. Again, they may dip in but one direction, forming a nearly plane incline, in which case there can be little choice as to location of the borings.

Not only the dip of the strata demands attention; the condition of their outcrop is also of great importance. English engineers distinguish three or four different kinds of outcrop of water-bearing strata. The porous strata that absorb the water may appear on the surface at the top of a hill, the most unfavorable occurrence. They may outcrop on the slope of the hill, and become so worn to conform to the general inclination of the hill, that the water running over their edges may have so great a velocity that only a small porcentage can be absorbed. This will vary with the slope. At the foot of a hill, and in a depression, is the most favorable occurrence of the outcrop. The outcrop may be naked, so that the water may be directly absorbed, or it may be covered by drift material; in this case the character of the drift determines the amount of water that may reach the porous strata.

Besides the inclination of the water-bearing strata, and the condition of their outcrop, their regularity and continuity must be looked after. Often a bed of clay beneath a porous stratum is found to thicken up to such an extent that it is impossible for water to find a passage. An upthrust of any impervious material through the water-bearing strata may blast all hopes for artesian water, in an otherwise favorable location. In such cases the land lying between the fountain-head and the barrier is the more likely to yield artesian water, as in some instances may be indicated by the appearance of springs, which indeed may be the only evidence of the existence of the barriers.

All these details of the configuration of the country may be studied with advantage before attempting to bore wells in an untried region, especially when it is intended to make that outlay which is necessary in sinking to great depths.

In our next we will take up the subjects of the "character of material" and the "climate," giving illustrations relating to the position and condition of water-bearing strata and their outcrop. We shall also consider the outfit necessary for boring wells, and the *cost*.

Wells Bored and in Progress.

F. W. Morse of Chico, Butte county, obtained for us the data of a well bored on I. R. Bennet's farm, four miles north of Chico. Since the memorandum was handed to him it has been published in the Chico *Enterprise*. The well was finished one year ago, and proved a failure, reaching a depth of 686 feet without finding artesian water. The data are as follows: soil, 16 feet; gravel, 10 feet; yellow clay, 164 feet; gravel, 6; earth the color of ashes, 10; cemented gravel, 3; sandstone, 20; ash-colored earth mixed with white streaks resembling burnt or slaked lime, 40; brown hard-pan, 231; quicksand, 2; very hard basalt rock, 20; soft stone resembling blue clay, when pulverized, 80; quicksand, 1; sandstone, 30; pipe clay, 10; cemented gravel, 3; sand, 10; quartz gravel, 2; blue clay, 10; washed sand, 18; total, 686 feet. The bottom of the pipe is now in sand and gravel. We sunk the pipe five feet the last half day that we worked.

This is the only artesian well that has been sunk in the neighborhood. Plenty of water is obtained from surface wells at a depth of 20 feet, and in many cases a good supply is found at six or eight feet. The strata are often different at places only 20 or 30 feet apart. The water-bearing strata are principally sand and gravel.

J. W. A. W. writes us that there are only four flowing wells in Tulare county, one near Tipton of which so much has lately been published, and three others This well struck water at 280 feet below 6 feet of sandstone. It went 30 feet deeper through clay and four gravel beds, each of which gave water. It yields 86,000 gallons of water, containing only six grains of solid matter to the gallon. The three other wells in the county are on John Heinlan's place near Lemoore. There is a good deal of pipe being made at present in San Francisco for wells near Bakersfield. Pipe is also being shipped to the San Joaquin valley and to Mendocino county.

W. G. A. writes us from Gold Hill, Nevada: At Battle Mountain, Lander county, on the line of the C. P. Railroad, there are several artesian wells. The water is cool and quite free from deleterious chemical substances. The borings are about 150 feet in depth, and the geological strata are mainly volcanic detritus; clay strata, gravel and sub-alluvium.

At Elko on a bluff, or second bank of the Humboldt, the citizens are now boring for water. They have good machinery and are confident of success. At present the auger has reached the depth of over 400 feet. The valley of the Humboldt at that point is covered by strata of gravel, sand, clay and drusy carbonate of lime. The first artesian well in Nevada was bored in 1870, on the farm of S. C. Nevers, near Carson. Said well was 18½ feet deep, and the stream shot out 7½ feet above the surface, and is flowing yet with unabated vigor, sending up a stream sufficient to supply all demands for household purposes and a surplus equal to the wants of a large number of acres for irrigating purposes.

Prof. W. F. Stewart, State Senator from Storey county, introduced a joint resolution in the Senate of the last Nevada Legislature, which passed the Senate but failed in the House, memorializing Congress to make liberal donations of land in the arid valleys of this State to parties who were successful in causing a flow of water to the surface. There are millions of acres of as fine soil as can be found in any portion of the world, covered with luscious, succulent grasses during the spring and forepart of the summer, and not a hoof of stock to eat it because there is no water. These valleys are surrounded by mountains serrated by deep canyons, which if dammed at proper intervals, a supply might be stored up for summer use. This is one of Prof. Stewart's plans to make inhabitable the heavy rich valleys in this State, that are now worthless. Stewart intends to introduce his resolution again this winter.

The new City Hall well at San Francisco, near No. 20 in the Figure, was, at last accounts, 58 feet deep. It passed through yellow sand, 40 feet; then black sand. At about 40 feet a bed of vegetable matter was bored through. Wood of a dicotyledonous tree was brought up, together with a fibrous substance, either bark or peat.

In our next will be given more concerning wells nearer home.

Mining patents have been issued for the following mining claims: California, Nevada county—Mark Zellerbach, consolidated, gravel mine; Selby Hill Company, Downie placer mine; William Terran and others, Buena Vista blue gravel mine. Arizona—Edwin N. Fish, Enterprise lode. Utah—Hezekiah McCoy and others, Silver Dipper lode; Wm. W. C. Hiff, coal mine, No. 31. Montana—Robert Hale, San Jose lode; Charlee Dahler and others, Harlem, Iron Rod Clipper and Glenn Falls lodes; John Treanor, Roderick Leggot and James Ryan, each one placer mine.

It is now claimed that the United States produce more carpets than any other country in the world.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME St., N.E.Cor. Pine, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported hy Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inveutions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemhurg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, aud is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered hy a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, helieving that the mutual conference of legitimate business and professional men is mutual gain. Parties in douht in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

KING ENGINE.

The Only SAFE BOILER.

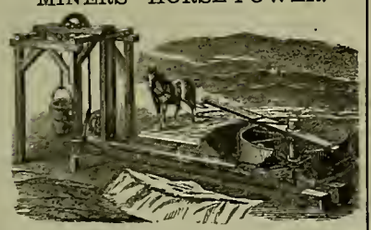
SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

No. 19 Channel Street, San Francisco, Cal

G. F. DEETKEN, MANAGER.

Highest price paid for GOLD, SILVER and Copper Ores.

SACRAMENTO SEMINARY.

SACRAMENTO, CAL.

The Sixteenth annual session of this Institution commences Monday, August 5th, 1878. Young ladies will here find superior facilities for a thorough and finished education, and a home of culture and refinement. The music will be under the direction of Prof. John P. Morgan, founder of the Musical Conservatory of Oakland. For further particulars address,

MRS. HERMON PERRY, Principal.

SUMMER RESORT.

Exhilarating Climate! Grand Scenery!!

☞Persons intending to spend a few weeks in the country during the summer months should stop at the Bridge House, on the South Yuba. Accommodation may be had for a few more boarders by addressing MRS. R. H. CULBERTSON, Emigrant Gap. House only one mile from the station.

HEMORRHOIDS OR PILES,

A treatise on their scientific treatment and radical cure, by E. J. FRAZER, M. D., San Francisco. Price, 25 cents; for sale at the bookstores and by the author at 221 Powell street. Sent by mail to any address on receipt of the price in coin, currency or postage stamps.

Continued from page 261.

THE Jennie June mine is a fine one, showing 14 feet of very good ore. The beauty of the ledge is the uniformity of the ore, there being no difference in the appearance of the entire ore body for 14 feet. This ore resembles very closely that of the Potter mine, and averages about $40 per ton in gold and silver, and it is the opinion of many good millmen that this ore can be milled without roasting.

SUPT. CHAS. DUNN, of the Northern Light mine can take out 1,000 tons of good ore just as easy as any place you ever saw; a face of rich ore the full size of the drift, and good ore everywhere in sight. This mine is very conveniently arranged for taking out ore—dumps the ore into a chute, where the teams can drive up and load without shoveling the ore, and the company's new road, now completed to Copper City, is a good piece of work, affording the company the best facilities for getting in their winter supplies; also for hauling their ore down to the mill for reduction. Mr. Whitney, President of the company, is always to be found at his post, carefully looking after the best interests of the company's property.

THE Winthrop company are driving their tunnel into the hill, and expect to cut their ledge in about 75 feet further. This mine is too well known to require any comment, and when the company put up a mill in the spring, a very material increase in the shipment of bullion may be looked for. There are many new discoveries, and so far as there have been any developments upon them, the parties find many most excellent prospects, and all they require is to sink a shaft or run a tunnel 100 feet to prove up a good ledge.

TUOLUMNE.

ITEMS.—*Independent*, Oct. 19: The Sonora foundry is now running on work for the mill being erected on the Kelsey mine, and on pumps for the Confidence mine. Six men are at present working at the Hunter, developing the parallel vein. On this a shaft is being sunk, and also a crosscut to connect, from the Hunter tunnel. Work on the La Rose claim has been discontinued, though the prospect is reported excellent.

LIVE OAK.—Work is progressing at the Live Oak. The shaft is now down 80 feet, showing the vein 2½ feet wide; ore rich and very thickly sprinkled with free gold. The rock proves richer as they get deeper, carrying also native silver. The sulphurets assay $75 in silver to the ton.

NEVADA.

MANHATTAN.—Austin *Reveille*, Oct. 19: During the six days ending yesterday the mill reduced 129¾ tons of ore, of the assay value of $16,696.30. Of this amount $701.67 was obtained from custom ores, $5,254.06 from tribute mines, and the remainder, $10,740.57, from the Frost and Curtis shafts. The 570-stope in the Frost shaft continues in good ore its entire width. A smaller amount of work has been done in the 670-level than usual, as the stope is up to the face of the drift. The drift, having been connected with the North Star shaft, is being pushed ahead. The 770 stope shows good ore on the west side of winze No. 2. The 770-west drift carries a strong ledge of average ore. Sinking has been resumed in winze No. 2 below the 870-station. The 560 stope in the Curtis shaft improves daily as work progresses up towards the 517. The ledge in the west drift is not as good as last week. The several stopes in the 600, 675 and 750 are not producing as much ore as formerly, but of a better grade. The 600-crosscut has cut the south ledge, and will be continued 75 feet further to the north ledge. The 825-east drift carries a strong ledge, with some good ore.

ITEMS.—J. F. Abel has a large ledge of mineral-bearing quartz on the west side of Paradise valley. The lower workings of the Fairmount mine look particularly well.

WASHOE DISTRICT.

CALIFORNIA.—Gold Hill *News*, Oct. 23: Daily yield, 225 tons of ore. The ore stopes on the 1650 and 1750 levels are looking well and show no changes of value to note. The north drift on the 1950 level is advancing on the ore streak before mentioned. The main north drift on the 1650 level is steadily advancing, the face in low grade ore.

CALEDONIA.—The north drift on the 1600 level is making fair progress, the face in favorable vein matter.

JULIA CON.—The damages to the pump rod will be repaired again to-day, and by to-morrow work will be progressing at all points as usual.

BULLION.—Sinking the main incline is going vigorously ahead, the bottom is a mixture of porphyry and quartz. The west drift on the 2000 level is now in 217 feet, the face in soft vein matter of a fine character.

SIERRA NEVADA.—Within three feet of the bottom of the sump ore rich in both sulphurets and free gold were taken out, which indicate not only the continuation of the ore vein downward with steady regularity, but a continuation of the uniform rich character of the ore as well. An assessment of $3 per share has been levied.

OPHIR.—The flow of water from the Union Consolidated during the first part of the week stopped the sinking of main incline, and rose in the shaft 50 feet above the 2100 level, at which point it was checked by the pumps and is now being again gradually lowered at the rate of about five feet per day, standing this morning at a point 30 feet above the 2100 level. It would have been entirely drained before this with the assistance of the tanks had it not have been for the breaking of a shaft which has prevented the running of the hoisting engine. The breakage will be repaired and everything again in running order by to-morrow, when the water will be quickly drained.

CON. VIRGINIA.—Daily yield, 180 tons of ore. On the 1950 level the south drift has been advanced at the rate of three feet per day, the face in vein porphyry carrying streaks of lively quartz. Crosscut No. 3, on this level, is being steadily advanced, the face in quartz and low grade ore. A drift northeast has been started from the south winze, the face of which is in quartz and low grade ore.

NEW YORK.—The south drift from the east drift on the 1100 level is now in favorable vein matter. The face of the north drift on the 1100 level is in the quartz, showing spots of good ore. Crosscutting this level will be commenced in a very few days.

HALE & NORCROSS.—Owing to the breakage of a pump rod, the water rose during the first part of the week above the 2100 level, where it has remained until this morning, when the station at that level was again drained

SENATOR.—The south branch of the Sutro Tunnel is running in directly on the west line of the mine and as soon as the tunnel has laid bare the broad side of the claim crosscutting the ore vein will be easy.

NORTH CON. VIRGINIA.—Sinking the main shaft is being pushed ahead with great vigor, the bottom in hard blasting rock. The flow of water in the shaft is light and gives but little trouble.

GOULD & CURRY.—The water is now drained and work is progressing as usual.

LEVIATHAN.—On the 750 level the lateral drifts both north and south are still being pushed ahead along the foot-wall of the ledge, in very favorable material, with good streaks of quartz continually being cut through. Crosscutting, so long deferred, will be commenced soon.

ALTA.—The ore in the bottom of the winze, below the 1450 level, continues to show a decided improvement. The face of the north drift on this level is also in better ore. The east drift on the 1550 level is also showing spots of good ore in the face.

JUSTICE.—The north drifts on the 1150 and 1225 levels are each showing good paying ore, and preparations are being made to stope ore on each of these levels. The west crosscut on the 1400 level is still advancing, the face in vein matter carrying spots of excellent ore. East crosscuts, Nos. 4 and 5, on the 1300 level, are still in good ore. Sinking in winze No. 1, below the 1300 level, is making good progress, the bottom showing occasional spots of rich ore.

BELCHER.—The south drift on the 2360 level is steadily advancing, the face in a mixture of quartz and porphyry. Crosscut No. 1 on the same level is now in 283 feet, the face in porphyry carrying streaks of quartz. The prospecting operations on the 2160 level afford no changes of value.

TROJAN.—The average assay of the car samples for the week has been $33 per ton. The usual amount of milling ore is being extracted from the second station level, at which point the ore stopes show splendidly.

BEST & BELCHER.—Sinking the new joint shaft is making the best of progress. The north drift on the 1900 level is again steadily advancing, the face in hard blasting porphyry.

NORTH BONANZA AND FLOWERY.—The putting in of the timbers from the tunnel level up to the surface will be completed and the hoisting frame raised ready to start up the machinery in a day or two more.

CROWN POINT.—The east drift from the bottom of the main joint shaft is still advancing, the face in quartz and vein matter of a favorable character.

CON. IMPERIAL.—The south incline winze, below the 2400 level, down 100 feet on the slope below the 2400 station, the bottom in quartz and vein matter of a very healthy character.

GOLDEN STANDARD.—Sinking the Golden Standard and Promontory new shaft will be resumed in about 10 days.

UNION CON.—The flow of water from the east drift from the north drift on the 1600 level is still quite strong. It is undoubtedly only a pocket and will be drained in a very short time.

SOLID SILVER.—The chamber at the head of the winze will be completed by Friday next, when, as soon as the water can be got out of the winze, crosscutting the fine ore vein developed at the bottom will be commenced.

LADY BRYAN.—The management of the mine are determined that the delay in prospecting shall be the very shortest possible. Work progresses accordingly.

MEXICAN.—The water is now under control and work was resumed in the joint Union Con. winze yesterday.

SILVER HILL.—Work suspended on the 900 level on account of water. No important changes to record of any of the prospecting drifts on the 800 level. As soon as a sump can be made, and a pump, tank, station, etc., can be put in, opening the 1100 level will be commenced.

UNION DISTRICT.

HIGH GRADE ORES.—Eureka *Sentinel*, Oct. 20: Our informant says that he saw larger bodies of high-grade smelting ores in the Union series of mines that he had ever seen on any part of the coast. The ore is rich and easily reduced, working from $60 to $150 in gold and silver. The company have now on their dumps many tons of high grade ore, ready for the melter. The company propose erecting a furnace this fall or winter, to be in readiness for the reduction of their ores as early as possible. Other mines in the camp are producing an excellent quality of first-class carbonate ore, among which may be mentioned the claim owned and worked by Messrs. Sanchez, Bennett & Co. The Blackhawk ledge is under the immediate supervision of Mr. W. E. Smith, a veteran miner of large experience, and under whose able management the most satisfactory results are being attained. A recent discovery, called the War Eagle, located by Messrs. Parks & Wilkins, is now attracting considerable attention in the district, on account of the richness of the ore, which assays up into the hundreds, and is easily reduced by a common mahogany fire. There are many other claims of more or less prominence in the district, which are being developed in a satisfactory manner.

OSCEOLA DISTRICT.

THE placers cover an area of twenty miles square; much of the ground being cut up by deep ravines and canyons, but in the canyons are beds and bars of gravel that prospect well. Osceola, like one-half the camps in Nevada, is without water sufficient for its demands, and a placer mining districts without water is like a Pioche saloon without whisky. * * * * The quartz runs all the way from $6 to $40 per ton; the ore is free milling and as averaged all over the district yields at the rate of $15 gold per ton. The Eagle Company's mill made a run on 700 tons of ore, which yielded $10,000 worth of free gold, and then a few assays from the tailings were reported as running from $5 to $22.50. The mill is idle at present, but the company employ some 15 men still at the mines and about the mill. The favorable climate in which this camp is situated allows the work to go on all winter, and the occasional finding of a rich nugget, has kept about 100 men "coyoting" and prospecting about with rockers and the little drippings of water, for the last six months, and this apparently insignificant work has not been thrown away, as in the time mentioned, these hundred men have taken out upwards of $20,000—all of this sum was collected by the use of the rocker and pan only. The largest nugget has been recorded and vouched for enough as coming from this district, and was worth $3,500.

ARIZONA.

GLOBE ITEMS.—*Silver Belt*, Oct. 10: Six men are at work on the Mexican ledge. The incline is 80 feet deep, and the sulphuret ore is coming in. W. A. Holmes asserts that one blast threw out 200 pounds of $2,000 ore the other day in his Ready mine. It is well to be ready for big things. A mill-crushing of five and a quarter tons of second-class ore from the Rescue mine produced 134 ounces, from ore worth by assay over $170 per ton. The El Capitan mine is prospecting well. From an opening 20 feet deep ore assaying from $289 to $2,084 has been taken. The vein from which this ore was taken is 20 inches wide. Good ore is still being extracted from the westerly half of the Richmond lode. The last shipment milled assayed $190 to the ton. In any other district this would be considered fine ore, but the owners thought it should have yielded more. At the depth of from 40 to 60 feet, the Cox & Coplin mines are yielding ore of wonderful richness. The highest grade, worth many thousands of dollars to the ton, is from two to four inches thick. Alongside of this is found good milling ore, worth $400 to $500 per ton. Six tons of the latter was sent last week to the Miami mill, and is lying there now unworked. The Chromo incline followed a vein of ore with an easterly pitch of 45° for over 40 feet. At the bottom a wall was found going down quite steep, and it is now believed that that will prove to be the foot-wall of the large lode. The theory of our mining men, it ought to be stated, is that the Imperial, Chromo and Sherman are on the same great fissure vein as the Stonewall Jackson, though they are five miles to the southwest of that celebrated mine.

COLORADO.

GOLD HILL.—Boulder *News*, Oct. 18: McBarnes, Clark, Christopher & Co., are working 10 men on the Horsefall, making money out of the old dump. They are also preparing to work the mine extensively. Our informant says that they will employ as many as 50 men when they get fairly under way. The ore is treated at the Corning Tunnel stamp mill, now rented and run by Hersey & Stevens. The Slide, under charge of Prof. J. Alden Smith, is sending a good deal is high-grade ore to market, employing 15 men. Van Wendt is working the Winona, for the Denver owners. Truman Whitcomb is working two shafts on the old Hoosier, and is also preparing to raise a large body of rich ore in sight in the Cold Spring. These, and other operations, are very encouraging.

SILVER CLIFF EXCITEMENT.—*Chieftain:* There is great excitement at Alamosa. Rosita is fast being deserted, it is said, for the new mines which are reliably reported to be the richest ever discovered in Colorado. The rush at Leadville is no comparison to this new excitement and rush. The people here are wild with the thoughts of the great richness of the new district. Eight tons of ore from the new district sold at Canon City for $11,000, and shipments are being made daily.

LITTLE PITTSBURG.—On Oct. 9th, the Little Pittsburg mine at Leadville produced 40 tons of ore. The next two days the product was 100 tons. It is currently reported that the $134,000 received by Geo. Hook for his one-third interest, and the $35,000 paid to release the bond held by Eastern parties has been taken out of the mine within a few weeks at an expense of about 3%.

ITEMS.—Boulder *News*, Oct. 18: Last week's run from the Caribou resulted in three silver bricks weighing 4,300 ounces, valued at $4,300. This represents six days work of the Nederland mill, with 10 stamps. On Saturday the Boston & Colorado Smelting works shipped from Central a gold brick worth $26,000.

IDAHO.

BLACK JACK.—*Avalanche*, Oct. 19: All reports from the Black Jack seem to confirm the extent and richness of the recent discoveries. At a point in the adit-tunnel about 375 feet from the mouth and 150 feet from the surface, the ledge shows up heavily in rich gold deposits, the pay-streak being over three feet in width and bearing all the characteristics of a permanent and immense ore-body. From that point to the shaft, a distance of nearly 300 feet, the yield promises to be unusually rich, and it is pretty evident that the Black Jack is steadily looming up as one of the great mines of the country. The Ellmore mill is pounding away on Black Jack rock and the crushings daily yield a steady amount of bullion.

GOLDEN CHARIOT.—This mine is once more coming to the front. An order was recently received here by Thomas West, the newly appointed Superintendent, to purchase wood and winter supplies and to set the works in full operation without delay. It will take several weeks to pump out the water, and after that is accomplished sinking operations will probably be resumed.

GOLD HILL.—The new level in the Gold Hill mine, which was opened about a month ago is 250 feet from the surface. They are in now about 50 feet each way running northeast and southwest. From the crosscut a No. 1 ledge has been struck three feet wide, the ore from which will mill from $50 to $150 per ton. The ledge contains streaks of specimen rock and zinc blende, with wire gold sprouting out like needles. It is a great curiosity and a very rare formation. Work is pushed night and day on the main levels. The stope at the turntable shows up some splendid ore, and the prospects are very flattering for a continuous ledge of the same, which, with the good showing elsewhere in the mine, will ensure a steady supply of rock for the 25-stamp mill for years to come. Under the careful attention of Superintendent W. A. Coughanour and his engineer, A. G. Phillips the entire works are in No. 1 order.

News in Brief.

THE Sacramento river is rising.

FROST near Memphis, Oct. 18th.

FANATIC riots in Mexico are reported.

THE Petaluma Woolen Mills have been started.

THE wheat crop may exceed 400,000,000 bushels.

THE oat crop will probably somewhat exceed last year's.

THE Russian army lingers 100 miles from Constantinople.

TROUT fishing is prohibited until after the first of November.

COTTON factory, at Chattanooga, Tenn., burned on Oct. 17th.

THE Santa Clara county fruit crop is estimated worth $2,800,000.

OCTOBER cotton crop returns, at Washington, indicate a yield of 5,000,000 bales.

THE British ship, *City of Dublin*, stranded on the Columbia river bar, Oct. 18th.

THE balance sheet of the Bank of Glasgow, shows a loss of £5,190,983.

THE outturn of the corn crop will not vary much from 1,300,000,000 bushels.

THE Russian Envoy to the Afghans, returns with an Afghan Embassy to the Russians.

THE steamer *John Bramhall*, with war material for Turkey, wrecked near New London.

A RETURNED miner from the Snohomish gold fields reports the alleged discoveries a fraud.

GENERAL GRANT is visiting Spain, where he has been most cordially received by King Alfonzo.

IT is said that the Rothschilds have agreed to loan Egypt $30,000,000 to clear off the floating debt.

THIS season large quantities of Napa county grapes will be shipped in refrigerator cars to the East.

DURING the rage of the yellow fever, 25 ministers have died at their posts in the southwestern cities.

OUT of nearly 2,000 turkeys raised by him this year, C. Rucker, Upper Pope valley, lost about 800 by roup.

THE whaling bark *Susan*, of New Bedford, was capsized in a hurricane, and 22 out of the crew of 25 were drowned.

CAPTAIN EADS estimates at as high as $200,000,000 the diminution in the amount of trade caused by the yellow fever.

A MORE pacific state of affairs has never been known to exist on the western side of the Republic of Mexico than exists just now.

THE Government is suing the Central Pacific Railroad to recover 20,085 acres of land in Colusa county, illegally entered and claimed.

THE Colorado potato beetle, the chintz bug and another insect have greatly damaged the potato crop in the neighborhood of Verde, Arizona.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING OCTOBER 8TH, 1878.

HYDRAULIC AND WIRE ROPE PUMPING SYSTEM.—William P. Barclay, Virginia City, Nev.

ONE-TRACK RAILWAY CARS.—David B. James, Visalia, Cal.

ADJUSTABLE CENTER-BOARDS.—Dennis McColgan, San Francisco, Cal.

BUTTONS.—Albert Michelson, San Francisco, Cal.

BUTTON FASTENERS.—Albert Michelson, San Francisco, Cal.

TELESCOPE ATTACHMENTS FOR FIREARMS.—Chas Slotterbek, Lakeport, Cal.

CHAIR BRACES.—Soven P. Sovenson, Rio Vista, Cal.

HARVESTERS.—Wm. H Foye, San Francisco, Cal.

CHILD'S TABLE TRAY.—Charlotte Gillard, San Francisco, Cal.

BARLEY AND MALT DRIERS.—Gustav S. Reuter, Sonora, Cal.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BASIN TRAP.—Wm. E. Worth, S. F. This is an improved stench or basin trap valve for the prevention of the admission of sewer gas into dwellings through the pipes connecting the basins with the sewers. Mr. Worth, who formerly kept the Worth house in this city, had considerable difficulty with the basin traps, and when he took the Nucleus hotel, which he now keeps, he found frequent repairs necessary there also. To remedy the defects he devised a trap consisting of two chambers in a cylindrical case, these being connected by a pipe through which water may flow. A float valve is arranged to close the opening at the upper end of this pipe when the water is out of the upper end of the chamber, while the pipe is opened by the valve while water is flowing. The pipe connecting the chamber extends down into a cylinder in the lower chamber, and a float valve in this cylinder allows the water to float down the pipe, but as soon as the flow ceases, floats up against the lower end of the pipe and closes it tightly. The water which enters the cylinder flows out of a passage at its top, and thence into the chamber and out of the waste pipe. Sewer gas is prevented from passing into the basin through this trap by its peculiar construction and operation, and the liability to siphonage is entirely overcome. The trap may be cleansed at any time. A body of water remains at all times in the cylinder, and both ends of the pipe connecting the chambers are sealed by the valves at all times except when water is flowing through the trap. The device is a practical one of great utility.

WATER GAS MANUFACTURE.—W. A. Goodyear, S. F.—Dated August 27th, 1878. The invention relates to an improved method of manufacturing water gas, the object being to produce at a minimum of cost, through the decomposition of the vapor of water, hy means of carbonaceous matter, a gas of great heating power. The apparatus used for the purpose is a suitable furnace, or generator, having one or more regenerative chambers connected with it. These chambers are loosely filled with firebrick, or other refractory materials, so as to allow a free passage of gases through the chamber, for the purpose of retaining and utilizing as much as possible the heat that is produced in the various stages of the process. The necessary pipes and valves for introduciug, discharging and controlling blasts or currents of air, steam or gas, which are employed or produced, are properly placed for the purpose. The apparatus is so arranged as to be continuous in operation, the currents of air, steam or gas moving through the chambers and furnaces, first in one direction and then in the other, suitable arrangements being made for controlling them at the proper time. The great result obtained hy the arrangement patented is the saving of hy far the greatest portion of the heat generated hy the combustion of the air gas during the passage of the air blast, which heat is subsequently taken up to the steam blast, and hy it returned to the generator, and thus utilized in the generation of the desired product, the water gas, which possesses a far higher degree of heating power than the air gas does.

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several Iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual

FOR PRINTING MATERIALS, the publishers of this pape patronize Marder, Luse & Co., Pacific Type Foundry and Printers' Supply Warehouse, 532 Clay street, San Francisco, Cal. Send them a stamp for specimen sheet, and say advertised in this paper.

The Averill Mixed Paints.

Now that the dust has been laid in most parts of the State, all those who wish to refresh and beautify their dwellings and outbuildings will begin painting. We doubt not we shall help some readers to a choice of materials when we state that we have heard nothing but praise of the Averill mixed paints from those in the country who have written to us about them. These paints have been advertised considerably in the PRESS, and we doubt not are known experimentally to hundreds of our readers. To those who have not yet used the Averill we can but say that our experience with it has been most satisfactory and such that would lead us to commend it to others.

The fact is that the manufacture of the Averill mixed paint is one of the most thriving and progressive of our local industries. Not only are larger amounts than ever before shipped to all parts of this coast and continually winning new friends by sterling quality and readiness for application, but the export of the paint to the islands of the Pacific, makes the Averill paint a promising item in our export trade. It is being shipped to Australia in considerable quantities. In the Sandwich islands it has been in use five years, and the shipments this year are six times as great as in any former year. This increase of demand after the complete test which has been made of the material is indisputable evidence of the satisfaction which the paint gives to its users.

To its long list of victories at fairs and industrial exhibitions the Averill paint adds a conquest at this year's State fair at Sacramento. Among other valuable qualities the committee awarded it the first place for the "greatest durability." This is, of course, a very strong point in a paint, for almost any material if skillfully mixed looks well at first.

The California Paint Company, who are the manufacturers of the Averill on this coast, make it to suit all purposes, from the outside painting of barns aud bridges, or roof and sides of other buildings, to the exquisite tints for inside finishing. It is also made for painting wagons, and every other manufacture of wood or motals. We believe that any one needing paint for *any* purpose will do well to send to the California Paiut Company, No. 329 Market street, S. F., for card of colors and prices of material suited to the purpose they require.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Keystone Quartz Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Sierra county, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No 6) levied on the thirtieth day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Carolan, James, Trustee	59	200	100 00
Hall & Charles, Trustees	68	1248	824 00

And in accordance with law, and an order of the Board of Directors, made on the thirtieth day of August, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, No. 201 Sansome street, corner of Pine, San Francisco, California, on the twenty-eighth day of October, 1878, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, No. 201 Sansome street, corner of Pine, San Francisco, California.

Mount Jefferson Milling and Mining Co.—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1878, an assessment (No. 5) of five (5c.) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 315 Pine St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fifth (25th) day of November, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the seventeenth (17th) day of December, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 8, No. 318 Pine St., San Francisco, Cal.

New Basel Gold Mining Company.—Principal place of business, 610 Merchant street, San Francisco. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of September, 1878, an assessment of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 18th day of November, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. D. F. LUCAYE, Sec'y.

Office 610 Merchant street, San Francisco, Cal.

Orion Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the fifth day of September, 1878, an assessment (No. 3,) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 28 Sansome Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fifth day of November, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 20th day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

P. CONKLIN, Sec'y.

Office, No. 28 Sansome Street (up stairs), San Francisco, Cal.

Summit Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the tenth day of September, A. D., 1878, an assessment, (No. 5,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the twenty-second day of October, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the nineteenth day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

The California Fruit Growing Association.—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three ($3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the California Fruit Growing Association, held September 24th, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till Saturday, the 26th day of October, 1878, and the day of sale of delinquent stock is hereby postponed to Friday, the 22d day of November, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco.

POSTPONEMENT.—At a meeting of the Board of Directors held on the Nineteenth day of October, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till November 30th, 1878, and the day of sale of delinquent stock is hereby postponed to December 21st, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

Vigorit Powder Company.—Location of principal place of business, City and County of San Francisco, California. Location of works, California City, Marin County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No 1) levied on the first day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. Shares	Amount
Louis McLaue, Trustee	30	437½	$218 75
Louis McLaue, Trustee	32	½ of 375	218 75
O W Grayson, Trustee	62	1312½	656 25
H H Shinn, Trustee	91	400	200 00
H H Shinn, Trustee	92	400	200 00
H H Shinn, Trustee	93	400	200 00
H H Shinn, Trustee	94	112½	56 25

And in accordance with law, and an order of the Board of Directors, made on the First day of August, 1878, so many shares of each parcel of stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 1, 109 California street, on Wednesday, the second day of October, 1878, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

JAS. W. BAKER, Sec'y.

Office, No. 109 California street, Room 1, San Francisco, California.

POSTPONEMENT.—By an order of the Board of Directors made on the First day of October, 1878, the above sale is postponed until Monday, October 21st, 1878, at the same hour and place.

JAS. W. BAKER, Sec'y.

POSTPONEMENT.—By an order of the Board of Directors made on the Eighteenth day of October, 1878, the above sale is postponed until Friday, November 1st, 1878, at the same hour and place.

JAS. W. BAKER, Sec'y.

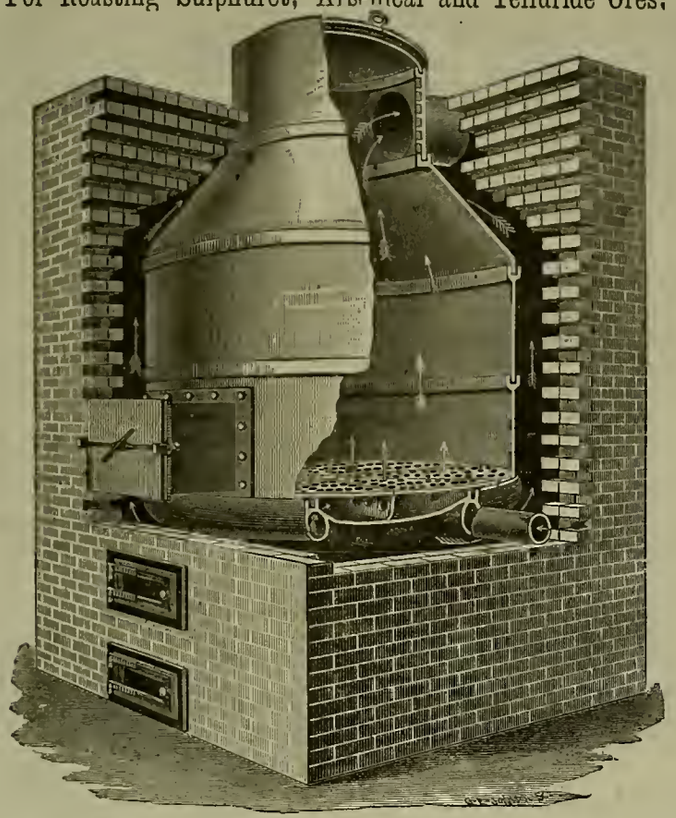
Z. A. WILLARD'S AUTOMATIC FURNACE

For Roasting Sulphuret, Arsenical and Telluride Ores.



The attention of scientific and practical men is called to Z. A. Willard's new method of treating sulphuret ores.

This process has been tried and tested on a large scale in Boston and in Colorado on every variety of ore, including sulphurets of iron, copper, lead and antimony, and arsenical and telluride ores of high and low grade, and in all cases with the most complete success.

The advantages claimed for the Furnace are: Perfect adaptation to the process. Simplicity and ease of construction. Cheapness—caused by shortness of time required in roasting, small amount of fuel needed, dispensing with skilled labor, and by the low cost and durability of the furnaces. Durability—the low heat used not injuring either iron or brick work. Economy of fuel—the amount used not exceeding one cord of wood to ten tons of ore. Economy of labor—no skilled labor, and very little labor of any kind, its automatic action only requiring one man to six furnaces. Perfect nature of roast—by which all the sulphur is burned away, the base metals oxidized and the precious metals set free. Ability, by reason of the perfect nature of the roast, to use chlorination (Plattner's method) for saving the gold in strictly gold ores. No loss by dust or volatilization.

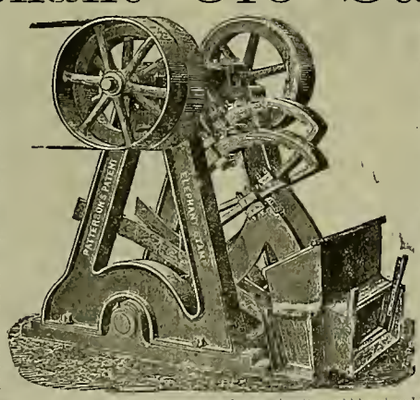
The cheapness and simplicity of this process renders it of vast importance in solving the question of the profitable reduction of low grade refractory ores.

Z. A. WILLARD, Patentee,

Baldwin's Hotel, Market St.,

SAN FRANCISCO.

Elephant Ore Stamp.



We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Carihoo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No 342 Main St, near Harrison, San Francisco For particulars, apply to

EDMUND WHITE, Care of A. B. Grogan, 705 Sansome St.

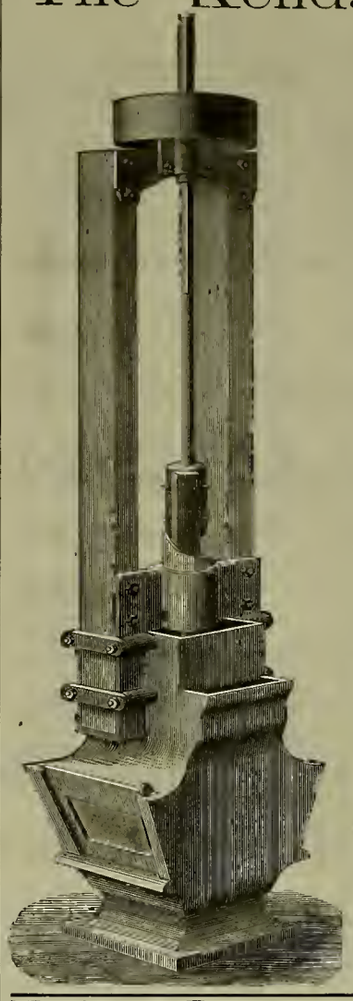
GOLD, SILVER AND COPPER MINING, Reducing and Concentration Machinery.

Hoisting Engines, Diamond Pointed Rock Drills, Manufactured by M. C. BULLOCK.

Address, FRASER, CHALMERS & CO., Chicago, Ill.

The Kendall Battery.

STEPHEN KENDALL, Patentee.



This Battery embraces the only genuine improvement that has ever been made in the process of reducing ores. The frame is all secured to the mortar, so that no extra framework is required. The stamp is rotated by a horizontal pulley on the top of the frame, and raised by the cam which is set horizontally on the girt timber. The upper end of the stem is made square, and works up through the pulley. When the stamp falls it crushes and grinds the ore fine by the continual rotary motion. The mortar has three discharge openings, and is adapted to either wet or dry crushing. A mill with an 800-pound stamp will crush five tons of average ore per day, shipping weight, 4,000 lbs., and requires about five horse-power. A 1,600 lb. stamp mill is in process of construction, which will give a capacity equal to any five-stamp mill. Several of them are now in successful operation in various parts of the country. For PROSPECTING PURPOSES this mill has no equal, as it can be set up and moved with such facility and operated at so small an expense. Address for further information,

Rankin, Brayton & Co.,

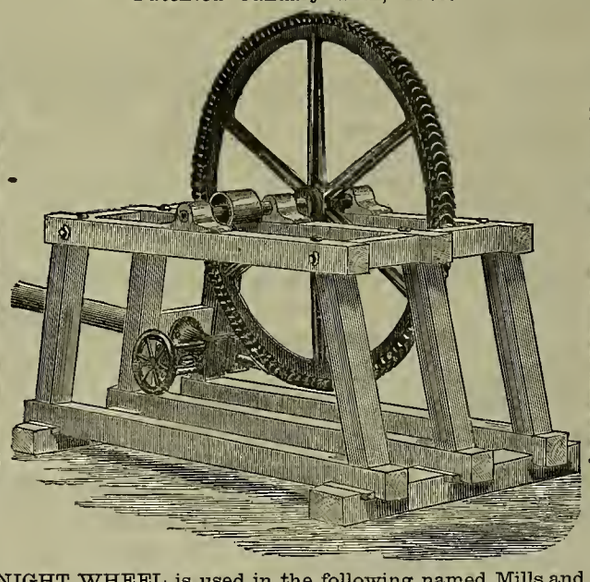
Pacific Iron Works. San Francisco.

Knight's Water Wheel,

Patented January 12th, 1875.

This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.



This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.

The KNIGHT WHEEL is used in the following named Mills and Hoisting Works, to which the Public are referred:

1-Eight-foot wheel, running Oneida Co.'s Mill, Amador county, Cal.; 60 stamps. Rob't Robinson, Supt.
1-Eight-foot wheel, running Con. Amador Mining Co.'s Mill, Amador county, Cal.; 40 stamps and two Hepburn pans. David Davis, Supt.
1-Eight-foot wheel, running Lincoln Gold Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
1-Eight-foot wheel, running pump at same company's mine. S. D. R. Stewart, Supt.
1-Eight-foot wheel, running Keystone Con Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
2-Four and one-half foot wheels, used in hoisting by reversible water power at same company's mine. O. C. Hewitt, Supt.
1-Four and one-half foot wheel, running Original Co.'s Mill, Amador county, Cal.; 40 stamps, one pan, one rock-breaker. J. R. Johns, Supt.
1-Four-foot wheel, running Gover Mining Co.'s new Mill, Amador county, Cal.; 20 stamps.
1-Eight-foot wheel, running same company's old Mill; ten stamps. John Palmor, Supt.
1-Six-foot wheel, running Talismau Mining Co.'s Mill, Amador county, Cal.; ten stamps.
1-Eight-foot wheel, hoisting and driving pump at same company's mine. John Tregloan, Supt.
1-Four and one-half foot wheel, running Bunker Hill Mining Co.'s Mill, Amador county, Cal.; ten stamps. John Palmer, Supt.
1-Four and one-half foot wheel, running Cold Mountain Mining Co.'s Mill, Amador county, Cal.; ten stamps. J. C. Goodman, Supt.
1-Six-foot wheel, running St. Patrick's Mill, Newcastle, Placer county, Cal.; 15 stamps. Jno. Townsend, Supt.
1-Eight-foot wheel, hoisting and running pump, compressor and hoisting at Sheba Silver Mining Co.'s Mine, State of Nevada.
1-Four and one-half foot wheel, running Luck Q. M. Co.'s Mill; ten stamps, Oregon.
1-Four and one-half foot wheel, running Republic Mill; 20 stamps, Nevada county, Cal. E. H. Dyer, Supt.
1-Six-foot wheel, at the Plumas Eureka, running 48 stamps, two pans, two rock-breakers. Wm. Johns, Supt.
2-Six-foot wheels, sent up to Sierra Buttes Mines, one to run 50 stamps and the other to run pans.
1-Six and 2 Four and one-half foot wheels, sent to Sauls burg Mine, Sonora, Tuolumne Co. J. Leechman, Supt

KNIGHT & CO.,
Sutter Creek, Amador County, Cal.

A. S. HALLIDIE.

WIRE ROPE

Office, No. 6 California Street, SAN FRANCISCO.

Manufacturer and Dealer in all kinds of

Iron and Steel Wire Rope,

Flat and Round, for Mining, Shipping, Hoisting and General Purposes.

Having the most complete and extensive Wire Rope Works in the United States, I am prepared to manufacture Wire Rope and Cables of any length or size at short notice, and guarantee the quality and workmanship equal to any made at home or abroad.

Iron, Steel and Galvanized Wire

Of all sizes on hand or made to order.

WIRE

Barbed Fence Wire.

Sole Proprietor of

Hallidie's Endless Ropeway,

For the Transportation of Ores, etc.

Send for a Circular.

A. S. HALLIDIE,

Office, No. 6 California St., San Francisco.

N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS,

Manufactory. 17 & 19 Fremont St., S. F.

THE IMPROVED O'HARRA

CHLORIDIZING FURNACE.

Patented Sept. 10th, 1878.

Now in Operation at the Extra Mining Co.'s Works, Copper City, Shasta Co., Cal.

Two men and two cords of wood roast

Forty Tons of Ore in Twenty-four Hours,

Giving a full chlorination (100%) at a cost of 30 cents per ton. Address,

O'HARRA & FERGUSON,
Copper City, California.

Or CHAS. W. CRANE, Agent,
Room 10, Safe Deposit Building, San Francisco.

PACIFIC MAIL STEAMSHIP CO.

The Company's Steamers will sail as follows, at 12 M.:

CITY OF TOKIO.....December 3d.
CITY OF PEKING.....January 4th.
For YOKOHAMA and HONGKONG.

COLIMA.....November 5th
For Panama and New York, calling at Mazatlan, San Blas, Manzanillo and Acapulco, touching at San Jose de Guatemala and La Libertad, to land passengers and mails only.

Tickets to and from Europe by any line for sale at the lowest rates—also to Havana and all West India ports.

CITY OF NEW YORK.....October 28th, at 12 o'clock, noon, or on arrival of the English Mails, for HONOLULU, AUCKLAND and SYDNEY.
$10 additional is charged for passage in Upper Saloon.

ALASKA.....October 30th
For Victoria, Port Townsend, Seattle, Tacoma and Olympia, connecting at Tacoma with Northern Pacific Railroad for Portland, Oregon.

Tickets must be purchased before 11 A. M. on day of sailing, at Wharf office.

For freight or passage apply at the office corner First and Brannan streets.

WILLIAMS, BLANCHARD & CO., Agts.

BUY THE N. Y. WATCH,

Barlow J. Smith. M. D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervous derangements, Brain, Spinal and Heart diseas s, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-moterpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygieuic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology tbo past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

Artesian Wells.—No. 4.

Character of Material.

Spon says, in his "Practice of Sinking and Boring Wells": "Every permeable stratum may yield water, and its ability to do this, and the quantity it can yield, depend npon its position and extent" The type of pormeable material is sand; of impermeable, compact clay. As rock is full of irregular fissures water does not exist in it in regular strata, thero is small chance of obtaining water in it, and for this reason, as well as on account of the difficulty of horing in it, rock is avoided as much as possible. Between sand and clay, there are innumerable grades of permeability according as the one or the other predominates or as other material, for instance, gravel is mixed with these. Experiments by Prestwich, quoted by Spon, have shown that ordinary siliccous sand will hold about one-third of its bulk of water, or from two to two and one-half gallons per cubic foot. When clay and gravel are introduced the amount absorbed is less. When the material is compacted as in sandstone or limestone water is still absorbed but in very diminished quantity. Drift material, consisting largely of sand and gravel bronght down comparatively recently by rivers or floods, may yield water, but not in large snpply. Alluvion, consisting of sand, gravel, rolled pebbles, clays, and found in the valleys of great rivers, is distributed more regularly than drift and over more surface and hence may yield larger supply of water. But, as has been already many times hinted, it is in more regular, more widely extended, and, generally speaking, deeper strata of sandstones, limestones and clays, that reliahlo snpplies are to be sought. The striking of rock is, of course, no sign of failure. The rock may he drilled through, or if it is merely a boulder it may be avoided by another boring.

The Climate.

The amount of rainfall ou the outcrop of water-hearing strata determines the quantity of water that may probably be obtainod from them at a distance by artesian borings. An entirely rainless district may he supplied with artesian water. In fact the gentle tilting of alternating pervious and impermeable strata seems to be a special arrangement of nature, by which low, dry, unwatered plains may receive their share of irrigation. All that is needed is rain on the surrounding highland where the edges of the water-bearing strata are turned up and exposed. An examination into the condition of this outcrop (as in the last article) of its extent and of the rainfall upon it, may furnish data for roughly calculating the amount of water that the plains may expect to be able to obtain. For instance, on a steep outcrop less water can be absorbed than on a more level one; again, less water can be appropriated by the outcrop from a deluge immediately followed by burning sunshine, than from a long continued drizzle followed by dull cold days. It is unnecessary to enter further into this. The entire subject in fact is very simple and even suggestions are hardly necessary to an intelligent and observant mind.

The Tools.

Artesian well-boring machinery has been made quite a study. A great number of inventions and improvements have been made over the primitive auger and rods, so great a number that it would be impossible in a short space even to name, much more so, to describe and explain them. Only the most necessary apparatus will he mentioned without description, leaving the latter to cuts which will appear in the next issue.

A derrick is required, which may be easily rigged out of three spars. It must be at least as high as the length of the longest rods to he used in sinking the auger. A tackle is necessary for use with the derrick; also a barrel and cranks for winding the tackle rope. For boring in stiff clays, a twist auger of some kind is needed; for working in soft materials, a pod auger; for rock, a drill. The rods for sinking the auger, may he made of stont poles, joined together by wrought-iron couplings, and may be gotten np hy any good carpenter and blacksmith. For ohvious reasons it has been recommended to make the rods of straight-grown trees, of requisite diameter. Iron rods and pipes are used frequently, but while better than wood on many accounts, are much more expensive. Wooden rods may be turned by a stout wooden lever; for the iron rods and iron lever is better. The iron couplings for the rods are made with shoulders, upon which iron shoes attached to the hook on the tackle block catch, and hy this means the rods are raised and lowered. Two of these shoes are needed. In the vast majority of cases the well must be tubed. Where any great lateral pressure is exerted hy the strata passed through, it is necessary to use considerable force in the sinking of the tubes. They are best made of sheet iron, lack or galvanized. Upon the lower pipe, a steel ring sharpened on its lower edge, is riveted, and serves cut the way for the pipe. It must be stoutly riveted, for its detachment when at considerable depth may ruin the well. The pipe may be forced down by applying snfficient pressure at the top, in almost any convenient way. Sometimes an iron ring is fitted over the top of the pipes Chains attached to the ring descend and are wound about a lever made of two stout timber. spread so as to include the pipe. One end of the level is fastened to the ground a foot or so from the pipe. The long end extends out for some twenty or thirty feet on the other side of the pipe, and is weighted. By this means tremendous pressure is exerted on the pipe. When sinking the pipe, sand or other fine material has to he removed from the bottom. This is accomplished hy a sand-pump. If the hole is not large enough to allow the pipe to pass, reamers are used to scour it out larger under the end of the pipe. With an outfit such as this, and in addition a few tools for recovering articles that may accidentally fall down the well, arrangements for soldering the pipes, and sharpening the cutting apparatus, any intelligent and careful man, with a couple of laborers, can sink an artesian well in favorable material and to a reasonable depth, say 200 or 300 feet.

We had the cost of tools prepared for this issue, but it is crowded out. It will be published in our next, together with cuts of the tools and description of methods.

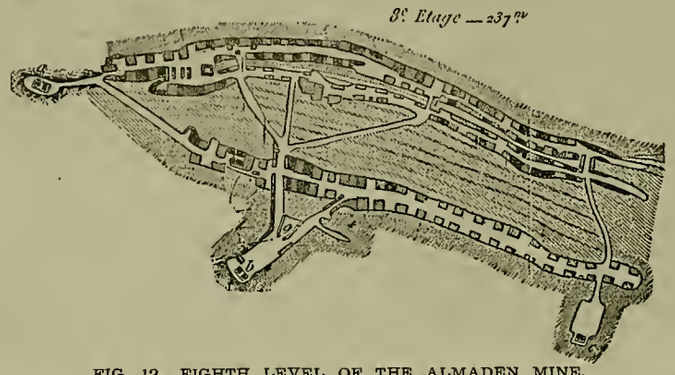

FIG. 12. EIGHTH LEVEL OF THE ALMADEN MINE.

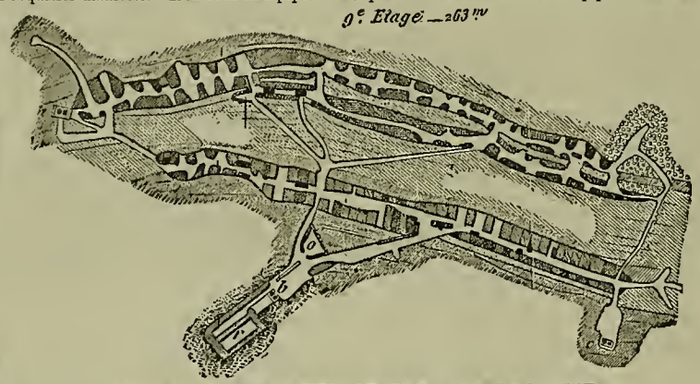

FIG. 13. NINTH LEVEL OF THE ALMADEN MINE.

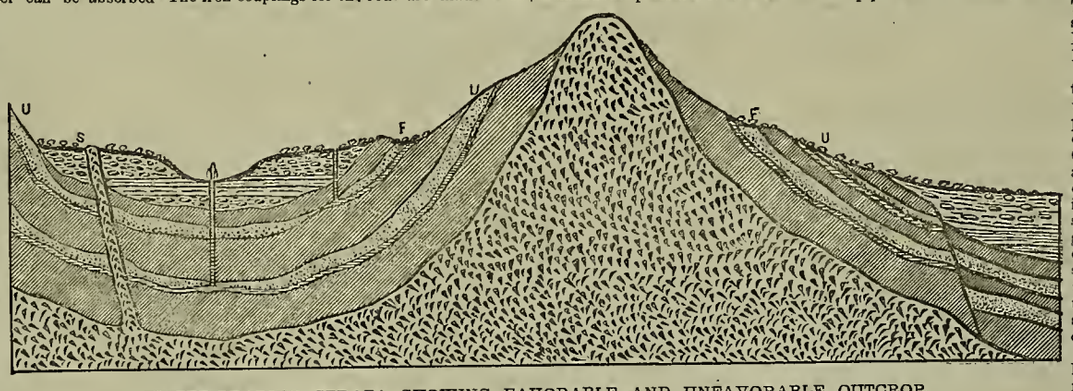

WATER-BEARING STRATA—SHOWING FAVORABLE AND UNFAVORABLE OUTCROP.

Mines and Works of Almaden.—No. 7.

[Translated for the Press from "ANNALES DES MINES."]

Eighth level; depth, 237-64 meters.—Fig. 12. From the 7th to the 8th levels the three veins dip slightly to the south: The vein San Pedro y San Diego takes an importance more and more great; it extends for a distance of 170 meters in length, with a mean width of eight meters. At its western extremity it is inflected slightly to the north, so that its bearing becomes nearly north 125° east; it is then abruptly cut by the schistes.

The San Francisco and San Nicholas are in their eastern part sensibly parallel to the San Diego, but the western part of the two veins turns in such a manner as to pass gradually from the direction north 110° east to the direction north 90° east. From this disposition of the two gronps of veins, it results that their distance apart at their eastern extremities is nearly the same as npon the npper levels, while it diminishes towards the west, where it is reduced to about 15 meters.

The length of the San Francisco is 180 meters, the mean thickness is 4.40 meters; the similar dimensions of the San Nicholas are 185 meters and 5.5 meters; the two veins now run parallel, and at a small distance the one from the other; they even seem to unite at their western extremity; when at any rate the interval which separates them has been too small for the rock to preserve.

Ninth level; depth, 263.55 meters—Fig. 13. The tendencies of the 8th level, already mentioned, pronounce themselves more and more. The San Pedro y San Diego has a length of 170 meters, and a thickness of 6.50 meters. Its southern wall to the east is formed of a sterile sandstoue, to the west by schiste. Its hanging wall is entirely formed of a very argillaceous schiste.

The San Francisco and San Nicholas separated from San Pedro y San Diego by alternating beds of quartzite and of schiste, forms in their *ensemble* a great curve, concave to the south. Quartzite forms the hanging and foot walls of the San Francisco. The foot wall of the San Nicholas is formed of sandstone, its hanging wall of schiste. The length of the San Francisco is 145 meters, its thickness 2.60 to 3 meters. The San Nicholas, which seems to absorb the San Franoisco to the west, is 180 meters in length.

These two veins abut to the east against a rock, which has already appearcd, but less developed, to the east of the 6th lcvcl. This melaphyric rock is composed of a grayish white paste, in the midst of which are seen a great number of grains of quartz. It is often in a very advanced state of decomposition, which makes it difficult to recognize; it then resemhles a coarse porcelain clay (kaolin).

A prospecting tunnel has heen run into this rock, but no trace of cinnabar was found, and it was abandoned before this mass was traversed, hence its extent is unknown.

Tenth level; depth 290 meters—Fig. 14. (Fig. 14 has been crowded out of this issue It will accompany the next article.) As the figure shows the 10th level it is only in a state of beginning. A gallery starting from

Continued on page 284.

CORRESPONDENCE.

We admit, unendoreed, opinione of correspondents.—Eds.

The Golden Fleece Gold and Silver Mining Company.

[From our Traveling Correspondeut.]

This mins is located in Peavine mining district, Washoe county, Nevada, distant 10 miles north from Reno. The mine is incorporated in this State; principal place of business, Reno, Nevada; capital, $300,000, divided into 30,000 shares, of the par value of $10 per share. President, T. K. Hymers; Secretary, M. Lippman. This mine was located October 4th, 1873, since which tims there has been expended upon the mine in running a tunnel, sinking a winze, making crosscuts, and other uecessary improvements, $36,000. The ledge has been opened for about 200 feet, and in the several crosscuts is found to average about 24 feet in width, and by actnal measurement there is in sight more than 10,000 tons of ore that will yield $56 per ton. This conclusion is arrived at hy a rock test made by the usual milling process. The ore is what is denominated "free milling," that is, containing bnt little rebelliousmetal. There is on the dump abont 600 tons of ore awaiting milling facilities. The stock is nearly all in the hands of three gentlemen, citizens of this town, who, by good management and hard work, have succeeded in bringing this valuable property to its presant advanced stage of development; hut when about to realize a hsfitting reward for their labor and money, they encountered a body of water in one of the lower levels, which they eonld not handle with their machinery, and which will entail upon the company an expenditure of money which they are not preparsd to meet. They are now offering inducements to capitalists to put their shonlders to the wheel and aid them in putting this property among the dividend-paying mines of the Pacific coast. What is required is heavier pumping machinery and a mill. The mine is plsasantly sitnated, plenty of wood and water, easy of access, and in one of the healthiest countries in the world.

The Southern Nevada Mining Co.

This mine is located in Santa Fe mining district, Esmeralda county, Nevada, and about 27 miles northwest of the village of Bellville, which is the nearest postoffice. The company is incorporated, and owns at present five original locations of 1,500 feet each—namely, the Reno, Sunrise, Jennie, London and Badger—making 7,500 linear fest, by 600 feet wide; a claim extensive enongh to make a half dozen big mines. The capital is $10,000,000, divided into 200,000 shares at $50 each. President, Mark Strouse, of Virginia City; Secretary, M. Lippman, of Reno, where is located the principal plaes of businss. A tunnel has been run, shafts have been snnk, drifts have been extended in different directions, crosscuts have been made, showing that ths ledges are quite large, and in fact, that the bill npon which it is located is literally full of ore. The mine is on a minsral belt that is known as the bass metal rangs, and consequently will have to be smelted. The ore contains about 40% lead, and 20 tons averags rock worked in San Francisco yielded $260 per ton, principally silver. There is a great abundance of wood and water, belonging to the company. A furnacs will soon he constructed, and work commenced in earnest to open up this mine. A new stage line has just been estahlished from Virginia City to Bellville, which passes withiu eight miles of the property. The point of dsbarcation is new Boston, from which a good wagon road leads to ths company's works.

This property is in the hands of prominent and enterprising citizens of Reno and Virginia City, and from the tenacity witb whicb they cling to this stock one would naturally suppose that they bslieve in "Southern Nevada." W. G. A.

Reno, Oct. 21st, 1878.

The Silverado Mines.

EDITORS PRESS:—As Santa Rosa mining district is attracting no little attention from the mining public, perhaps a brief skstch of its history and progrss may interest your readsrs.

Santa Rosa district is sitnated in the southeast corner of Los Angeles county, adjoining the wsstsrly lins of San Bernardino county.

The first discovery was mads in August, 1877, by Messrs. Purcell and Slaukard. District was organized ths same mouth. The first location was the Southern Belle lode; next ths Mammoth lods, and soon after the Grayhack lode, which at this date is one of ths most promising lodss in ths district. The locations on this lode are the Grayhack (the discovery clain); first extension north, Mountain View company's claim, now owned by Messrs. Lake & Sears, of Santa Ana; the first extension south, the Blue Light mine; the second extension south, the Dunlap miue; the third exteusion south, the Flanagan mine. The three last named are owned by the Blue Light M. Co., recently iu oorporated under that name, with principal place of busiuess at Los Angeles. Up to January, 1878, little or no attention was paid to those discoveries by people of this sectiou, save some little prospsoting hy the discoverers of these claims. In January, 1878, a disiuteresed party sent ores to San Francisco for assay from the Blue Light location—four samples in all, which assayed in silver respectively as follows: $9, $18, $23 and $100 per ton. This furnished an inducement to the parties to prospect and trace out their ledge, which led to the discovery of a fine body of galena ore at the top of the mountain (ths previous assays being from the canyon), whicb gave $145 per ton silver, with from 20% to 60% lead. Other assays following thess gavs as high as $350 per ton silver. These assays, when made public, attracted some of the farmers (many of whom are old miners) from ths valleys to prospcct, and there has heen more or less prospecting going on all summer, with favorable results. At this time it is well demonstrated that we have a mineral belt of from 5 to 6 miles in width hy 20 miles in lsngth—tracsd continnously at this date for this distance.

Other Districts.

South of Santa Rosa district the Santiago district has been recently organized. Still to the south of this is the Trabuca district—the former embracing that section of conutry known as Shrewsberry canyon, the latter that of Trahuca canyon and the Santa Rosa district, embracing that of Maderia canyon, Ladd canyon and a part of Shrewsberry canyon. The first discoveries were made in Maderia canyon, whers the town of Silverado is situated. Silverado is a veritable mining town—having already two stores, two meat markets, fivs saloons, two hlacksmith shops, two feed stables, two hotels, one restaurant, and two bakerics, besides other business establishmeuts.

There are a number of families that have already taken up their residence here, and more are coming. We ars in daily communication with Santa Ana and Anaheim by stages; also a direct line from Los Angeles every other day.

There are some half-dozen different lodes already discovered and traced out, besides others that are claimed to exist which have not been traced any distauce. Among the prominsnt lodes of Santa Rosa district are the Bear Gulch, Galena, Ophir, Grayback, Silver Belt, Faustina and the Pocohontas, all of which show ore at openings mads on the various locations. In Shrewsberry canyon, the greater portion of which is embraced in Santiago district, the prominent lodes are the Young America, Betty, American Union, Great Fall and Mint. These are continuations of the lodes passing through the Santa Rosa district. Still south the continnations are traced into Trahuca district. Some of the promineut locations in that district are the Emma, Bavaria and Vulture, all of which show an ahundance of galena ore, assaying in silver from $75 to $200 per ton. In the Santa Rosa district west of ths silver-bearing belt a vein of tin ore has been discovered; the ontcrop is about 40 feet wide and has been traced for two miles. The Geo. Washington company on this lode have had ssveral tests which show from from 20% to 30% tin. Still west of this at ths base of the mountain, about five miles west of Silverado the formation changes from slate and limestone to slate and sandstone. In this latter formation is the coal belt in which is situated the Sauta Clara and Black Star coal mines. The Santa Clara company have a 3-foot vein. At present they are not at work. The Black Star company have expended some $12,000 on their mine, and are now producing an excellent qnality of coal, which finds a ready market with consumers of southern Califoruia. Ths mine is now on a paying basis. This company has rescntly let a contract to bore 200 feet to prospect for other veins bslow the present ones. I hear of other discoveries of coal to the south in the same range that are very promising; also of discoveries of mineral in the belt some 30 milss south of present discoveries. Taking all things into consideration, there is no douht of the mineral wealth of this section of southern California, and all that is needed now is capital to develop. I am sorry to say that capital does not seem inclined to lend a helping hand. Were thess prospects on the other side of some desert or within the limits of the desert we would havs an abundancs of capital seeking us. One thing we are gratified with, our district is standing on its own merits, whicb is prohably the best for all interested. "CAP."

Silverado, Oct. 21st, 1878.

The Niagara Gold and Silver and Copper Mining Company.

[From our Traveling Correspondeut.]

This mine is located on ths eastern slope of the Sierra Nevada mountains, about 2½ miles west of Carson City, and in what is known as King's canyon. Contains 1,500 feet on the vein by 600 feet in width. Incorporated. The principal place of doing business, Carson City. Capital, $3,000,000, divided iuto 30,000 shares of the par value of $100 per share. President, W. D. Torreyson; Vice-President, T. W. Healy; Secretary, Thomas Roche. Title, perfect. Near the center of the claim a shart has been sunk to the depth of 100 feet in the ledge. From the bottom of the shaft a drift was run to the west 85 feet without finding the footwall. Some 300 feet south of the shaft and at a point much lower, a tuunel was run in parallel with the ledge along the east wall, exposing vein matter and pay ore of a very promising character. The ledge is supposed to he about 150 feet wide, taking the surface measurement as a oriterion. The lode is evidently a true fissure contact vsin, the gangue or vein-stone being quartz, calcite and a littls fluorspar, carrying gold, silver and copper. The hanging or east wall is a gneissoid granite, and the footwall is slate—hoth well defined. The trend of the ledge is nearly north and south, with an easterly dip. The ors assays reach a very high grade in gold and silver and a good percentage in copper. The facilities for mining and reducing are good; plenty of wood and water and a good millsite on the ground. The property has been examined hy such well known experts as Prof. Frank Stewart, C. A. Luckhardt, C. E. Hoffman, Superintendent Boyle, of the Alta, and others who have universally expressed flattering opinions of the prospect. There is now on the dump abont 80 tons of ore that would pay to mill, were there any milling facilities in rcach. This company—like hundreds of other meritorious mining enterprises that have been brought to the notice of your correspondent in this State—is at present doing nothing with their mine, for the want of money to put up machinery to raise and reduce the ore; and I am authorized by Judgs Healy, the principal owner, to promise most flattering terms to the money king, or kings who will come up with the coin to put this mine in working condition.

Before closing this article I desirs to oall attention to the following extract, with referense to this mine, taken from the report of the Nevada State Mineralogist, for 1874:

"The Niagara gold and silver and copper mine, is situated north of King's canyon. The vein is over 80 feet wide on the 100-foot level, and is encased in slate and gneiss. Besides two crosscuts on the surface there is a shaft 5x6, sunk to the depth of 100 feet. A drift about 75 feet running in a westerly direction (the dip of the vein being to the west pitching into the hill), cuts the vein at about 40 feet, thence runs 35 feet towards the west wall. The rock is of a greenish cast from the copper, which occurs from 5% to 30%. The copper schiste lies eastward of the gneiss, in which fine gold is found. This mine has good clay walls, and is doubtless a true fissure vein. It is a promising mine, and upon development may prove valuable. Assays of ore from this mine have reached into the hundreds."

W. G. A.

Carson City, Nevada, Oct. 7th, 1878.

Mining Patents to Foreigners.

EDITORS PRESS:—Thres years ago I wrote you from Silver Mountain, Alpine county, in this State, calling your attention to the great inconvenience, if not actual hardship, entailed upon foreiguers owning mines in ths United States, hy the Mining Act of 1872, which, whils tacitly allowing the foreigner to possess and work his claim, expressly dehars him from perfecting his title to it by United States patent.

Whils endeavoriug to enlist your advocacy in favor of some modification of this law, I pointed out at some length why I thought that, when a foreigner or foreign corporation had acquired his mining claim hy purchase from an American citizsn, and had complied with all the laws rsgulating its working and holding, he should hs entitled to the same privilege as to title as the citizen from whom he purchased—as part and pertiusnt of his purchass.

I shall not, therefore, uow occupy your time hy a recapitulation of thsse reasons.

Soon after so addressing you, I had this matter brought under the consideration of her Majesty's Secretary of State for Foreign Affairs, and after some correspondsnce with our representativs at Washington, a hill was introduced January 11th, 1875, in your Senate, of which I send yon a copy:

A Bill,

Authoriziug tbs issue of patsnts to mining claims in certain cases.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That in cases whers foreigners or foreign corporations have purchased mining claims for a valuahle considsratiou of citizens of the United States, who had complisd in the location and possession thereof prior to sale with the laws of the United States governing the same, *and such purchase was made prior to the date of the approval of the act to promote the development of the mining resources of the United States, approved May 10th, 1872*, and whers purchassrs shall have complied with the said law in the working of said claims, and shall apply for patent therefor, as in other cases, and pay to the United States the price thersof as provided by law, patents shall issue to such parties in ths sams manner and to the sams effect as in other cases.

SECTION 2. That in casss where application shall bs mads for patent to mining claims hy citizens of the United States, being *bona-fide* owners thsreof, and in possession of ths same, patent shall not be refused therefor on the ground that one or mors of the locators thereof may have been foreigners at the date of location: *Provided*, that said location shall have been made prior to the tenth day of May, 1872.

The hill was read twice, referred to the Committee on Mines and Mining, and ordered to be printed. And there the matter rests; but, finding, on my retuiu from England, that a conventiou on the Constitution is in session, I hcg again to call your attention to the subject, and if possible, through you, that of the Committee on Mines and Mining.

I do not propose to ask your Legislature to give foreigners the right of location on the puhlic domain; that is a privilege which should attach ouly to citizenship. All I ask is that when a foreigner purchases *bona fide* from a citizen, he shall be entitled to go direct to the landoffice and get bis patsnt, just as if he had been a citizsn.

Tbe people of the United States would be gainsrs in a financial point of view, becauss so long as a pateut is unobtainable by a foreigner, so long is your revenue dsprived of the $5 per acre which is not payable until a patent is ohtained, and you cannot take the land from him so long as he continues in possession and doss the statutory work on his elaim.

The citizen ownsr would also he a gainer from the simple fact that if his right of possession carried the right to patsnt, in whose hands soever, it wonld bs of more value and command a higher price; he would also bs savsd, in the case of dealing with a foreigner, the expense of getting the patent himself.

The hill sent applies only to cases where the purchase hy the foreigner from the United States citizen was made prior to the passage of the act of 1872, because it was thonght that a foreigner could now always protect himself hy insistiug on the citizen procuring a pateut before the purchase was completed; but a patent cannot hs got at a moment's notice, and the seller citizen who had not, previous to ths negotiation for purchase by the foreigner, got his patent, might not he in a position to remain in the country long enough to get it, nor the foreigner ahle to wait, and so the sale falls through.

I do not see, therefore, why the provisions of the bill should bs confined to purchasers prior to ths act of 1872, and would therefore delete all the words which I have underlined, and in place of the words "said law" immediately following, insert "provisions of the miniug act of 1872."

So much for this question of patents to foreigners or foreigu corporations; but there are two other matters which affect equally ths citizen and the foreign miner, and to which, as one deeply interested, (having expended upwards of £100,000 sterling of English capital in the purchase and development of mines in tbis State, yst unproductive,) I would taks tbis opportunity of directing attention:

1. I think that non-pronucing mines should he exempt from taxation, or only nominally assessed until they do produce. Tax the bullion but not ths mine or works, and in taxing the bullion allow a fair percentage discount for cost of production. I know mines in California taxed on $50,000 that never produced ore to pay.

2. Where a mine owner expends, or bas expended, in any one year, on an unpatented claim, say $50,000 or $100,000, or any sum over and ahove the statutory amouut necessary to bold the possession, and is unable in the following year to do even ths work necessary to hold the claim (cases of which I know), the excess expended in that year shall be credited to bim in following years, or, in other words, if the work I have to do in 1878 shonld be $1,000, and if I expend, in place of $1,000 in 1878, $10,000, that this amouut of work shall hold the claim for 10 years, on my satisfying the Recorder that such amount of work has been performed.

A miner or corporation, in 1878, has expeuded in *bona fide* work, say $100,000, on a claim on which the statutory work required is only $1,000; but in 1879 he meets with reverses and is nnable to expend even $1,000, is it fair that a jumper should he entitled to go in 1879 and relocate not the claim only hut also ths $100,000 worth of improvements? But such a thing is possible as the law at present stands, and, therefore, I hope the Committee on Mines and Mining will agree with me that, the sooner the law is amended in this particular, the hett r

LEWIS CHALMERS.

San Francisco, October 23d, 1878.

DANGER IN USE OF TANKS FOR DRINKING WATER.—A friend raises the question whether thers is really any serions objection to nsing ths water from household tanks for drinking and culinary purposes. If the tank is frequently cleaned and is protected from ths access of sewsr-gas and other contaminations, aqueduct or rain-water will not suffer from being temporarily kept in it; but since in nine cases out of 10 the danger of contaminations will *not* be sufficiently guarded against, ths discrest honseholder will make it a rule not to nse the water from the tank for drinking if it can possibly be avoided. Analysis has sometimes shown a considerable degree of contamination in water, even when the tank, supplied by an aqueduct, had been cleaned a week hefore; and in no case should a tank be allowed to go uncleaned for more than three months. The water as it flows through the aqneduct pipes carries more or less impure matter along with it, which settles to the bottom of ths tank. The amonnt may not be sufficient to affect seriously the quality of the water as drawn directly from the pipes, but its accumulation in the tank may be injurious if not dangerous. Then, again, it the tank is used to supply a water-closet, or if the overflow, as is often the case, communicates directly with a soil-pipe, the water may be contaminated in that way. This has happened in more than one instauce reported by sanitary anthorities, and probably in thousands of instances not reported nor suspected. The chief use of a tank where the water supply is by aqueduct is to prevent trouhle with hot-water apparatus if the supply is temporarily cut off; but it is rarely the case that such interruption continnes so long as to render it necessary to nse the water from the tank for culinary purposes. At any rate, it should be thus used only in cases of absolute necessity.—*Bost. Jour. Chem.*

MECHANICAL PROGRESS.

The Philosophy of a Chip.

Few of us who have set our lathe tool for a good "chip" and then watched the displaced metal slowly curling from the revolving shaft as the "feed" brings the iron to the point, have ever indulged in much philosophy on the form of the chip. This, however, and many other common operations of the machine shop, have been investigated by mechanical philosophers, and we find one of them in a paper read at a meeting lately held at the Paris exposition, discoursing as follows:

Flat surfaces are cut in the planing machine or in the lathe, and under most circumstances the two kinds of cuttings are almost identical in appearance—that of a cylinder formed of spirals more or less close, sometimes even in juxtaposition; but for this combination it is necessary that the two edges of the cutting should have been equally reduced, that is, that they should be of the same thickness. If it were otherwise the spirals would become conical; and such of these as appear to be most characteristic will now be described. The cutting obtained in mortising by means of a straight tool is absolutely cylindrical. When the tools cuts out in this manner, a rectangular groove, the material is compressed without any lateral deviation. If the cutting is of great thickness it is triangular, and the smooth surface is formed by the combination of the three faces at which the separation takes place, the direction in which crumpling takes place being the same as in all ordinary cuttings. The triangular form is the result of the compression being greater towards the middle line. To aid in forming an opinion on this point two blocks were placed side by side, which were planed at the same time in the line of junction of the pieces. Two distant horns were formed, which parted symmetrically from one another; each half-cutting following the law of shortening by which it was bound to assume a form concave towards the side which was held by its attachment to the block. The cuttings from a lathe, when they were produced from the annular groove by means of a straight tool, assumed exactly the same forms. For example, a cutting from a groove in what is called the Swedish piston is a continuous ribbon rolled up as on bobbin with the greatest regularity and of great length, without a rent. When turnings take the form of a helix the small lateral displacement of the piece is not large enough to give to the ribbon a different character to that from a planing machine, when, for instance, it is required to turn a shaft to a uniform diameter, and it is then easy, with good metal, to produce cuttings of great length. But when it is required to turn the end of the shaft or of any cylinder whatever the cutting follows a special course. If the tool be large in proportion to the diameter of the rings or circles on which it is acting the difference of diameter between the two edges of the cutting makes itself felt in the cutting, which assumes the form of a helicoidal surface with inclined generating lines, of which the two directrices are two helices of the same pitch but of different diameters. This universal geometrical character, moreover, is manifested in special ways according to the width of the ribbon and the interior diameter of the ring. In this way three horns may be obtained encased one in the other if the cutting of the tool be radial. Successive spirals foul each other when the direction of the cutting edge is a little inclined. The inner helix is replaced by a straight edge when the tool cuts right to the center of the face. Notwithstanding these differences of detail the same rules prevail; a greater or lesser reduction or shortening according to the thickness of the cutting; a less reduction of length at the thicker edge of the cutting; a smooth surface of separation, which always forms a developable surface; a rugged reverse face ridged as if waves of metal had been successively projected there; in fact, all the circumstances of a transverse flow of material—setting apart the secondary circumstances of transformation of the prism of metal from which the cutting is produced by augmentation of thickness and corresponding reduction of length.

It is the author's opinion, that for the construction of the best machine-tools, with the most suitable thickness of cuts, the minute examination of the cuttings is of the greatest importance; and that by the same means the surest evidence may be derived with respect to the qualities and homogeneity of the metal.

SHEFFIELD CUTLERS USING BESSEMER.—The *British Trade Journal* says that the exigencies of severe competition are forcing Bessemer steel pretty largely into use in the cutlery manufacture, but the quality of the resulting good is not such as to enhance the world-wide fame of Sheffield wares. It appears that steel rail ends and middles are bought for this purpose, and the increased consumption has induced several makers to blow special qualities of Bessemer steel, running them in small ingots—the same size, indeed, as "cast"—and pricing them to suit all customers, from £9 upwards. Scissors steels, which have been considered worth £40 a ton, are now "marked" in Bessemer at £12 10s per ton. German competition has been a powerful factor in inducing the use of low-class material.

Hardening Steel Tire Flanges.

An English journal gives an account of an Austrian furnace for partially hardening the steel tires of locomotive wheels. Although we do not build many locomotives on this coast, the arrangement may have other adaptations. A condensed description of the process is given in the *Iron Age* as follows: The furnace has a small, square, central grate, above which the section of the furnace is circular. The wheel with the tire on it is placed on a projecting ring of the furnace, and the nuts of the tire bolts are slacked to allow the tire to expand from the wheel when heated. The annular space around the tire is then packed with coke in a state of ignition, and blast coming from a large number of nozzles attached to a circular blast pipe is directed at the root of the flange of the tire under treatment. In order to insure uniform heating, the wheel is turned around from time to time. When the flange of the tire which is thinner and therefore heats more rapidly, has become dull red, the wheel is lifted from the furnace and the heated tire is plunged into water of 60° to 70° Fahr. As a fragment shown by the Oravitza-Anima railroad at Paris proves, this process hardens the steel to a depth of from 0.08 inch to 0.12 inch, especially near the root of the flange. The heating process, which must be rapid to insure its being local, requires only from six to seven minutes. The inner part of the tire must be kept cool by a covering of old cotton waste constantly moistened. It is stated that tires so treated last twice as long as ordinary ones.

AMERICAN COMPETITION IN EUROPE.—The *British Mercantile Gazette* says: The American exports of hardware from the port of New York to Europe, for the quarter ending March, show a considerable increase over the corresponding period of last year. The increase is mainly in household and builders' hardware, mechanics' tools, saws, cutlery, etc., which in some instances are being offered in England at quotations so low as to make it impossible that the manufacturers can derive but the barest margin of profit. A letter from New York states that advices then in hand from Europe were encouraging, and that dealers in one or two lines were quite sanguine of their efforts to create European trade. Travelers are now in England representing American houses, and there are American merchants in Sheffield who are prepared to take orders for hardware and deliver the goods within three weeks. In Canada, in a few special lines, the Americans are having it pretty much their own way. No steel rails are being sent from Sheffield to America, though once this was one of the best markets. These figures show how the Bessemer steel rail trade in America is growing: In 1873 the manufacture in the United States was 129,015 tons; in 1874, 144,914 tons. This increase continued each succeeding year until 1877, when the total was 432,169 tons.

AN ENGLISH MINING PUMP.—A recent English patent relates to pumping apparatus for mines, wherein a bucket and a plunger ram move together, the ram in a case communicating with a barrel containing the bucket, so that as the bucket discharges during the up stroke, and the plunger ram during the down stroke, a continuous discharge ensues. In the improved apparatus the bucket and plunger each obtains its supply of water through a separate suction and valve. The pump stands on two perforated suction pipes (windbores) fixed in a cistern, into which water flows from the mine. In a double clack piece (or valve piece) are two clacks (or valves), one over each suction, and two doors are provided, by opening which the clacks may be examined and changed. On one side of the clack piece is fixed the working barrel containing the pump bucket, which is suitably attached to the engine rods. On the other side of the clack piece is fixed the case containing the plunger ram; thus, the bucket is vertically over one clack or valve and suction, and the ram is vertically over the other clack or valve and suction. The ram is attached to the same engine rod as the bucket. On top of the barrel is a changing door-piece with door, by opening which the bucket may be examined, and leather replaced when necessary.

THE MECHANICAL CHESSPLAYER.—Mr. Gumpel's figure, Mephisto, of which we took a description from *Iron*, about five months ago, is now to be seen at the Westminster aquarium. His inaugural sitting was attended by a number of prominent players. Mephisto is unaltered in appearance, but is clad in a new and gorgeous dress. An important improvement, however, has been made in the board and men, which now approach nearly the ordinary Staunton pattern. No pressure is now required on the squares involved in the moves, but they may be made quite silently, and are fully observed by the unseen manipulator of the mechanism. This adds much both to the interest of a game and to the difficulty of penetrating the inventor's secret. The ingenuity of the contrivance is not only beyond question, but deserving of the highest praise. Its usefulness may possibly be doubted, but Mr. Gumpel, says *Iron*, is certainly entitled to the credit of having produced the most intellectual-looking machine we know of.

ENGLISH TRIBUTE TO AMERICAN INVENTIVE GENIUS.—*Punch* says that a Yankee baby will crawl out of his cradle, take a survey of it, invent an improvement, and apply for a patent before he is six months old.

SCIENTIFIC PROGRESS.

Getting Close to Nature.

In the *Popular Science Monthly* for November Prof. W. K. Brooks writes an article on "how to study natural history," which urges a true method. Concerning relying upon prints and the like, he says: The original investigator of nature soon learns by constant experience that descriptions or even drawings, however correct, do not exactly represent the objects themselves, but are imperfect and ideal abstractions. This is true, to a greater or less extent, of every drawing of the simplest organ or tissue, and of every description of a species of genus of animals or plants; but it is especially and most emphatically true of all attempts at definitions of the larger and more comprehensive groups of organisms.

A definition of such a group as an order or class of animals, attempting as it does to state in a few words the characteristics which are common to all the forms included, is necessarily abstract, and may not, in fact cannot, be exactly embodied in any one individual of the whole group. Then, too, certain characteristics which are exhibited by only one or two aberrant forms, and are accordingly not characteristic of the group as a whole, may be omitted from the definition, although they furnish the clue to the relationship with allied groups, and are therefore of the utmost importance. An illustration which is not drawn from the organic world may make this more evident. The fact that printed books have followed and are a perfected form of the parchment manuscripts of the middle ages is shown by the ornamental initial letters, imitations of the illuminated letters of the manuscripts, which are placed at the heads of the chapters of a few books. Notwithstanding their significance, these initial letters would not find a place in any definition or general description of a modern book. As a consequence of this inevitable lack of agreement between natural objects and their definitions, all knowledge of nature is of very little value unless it is based upon a direct personal acquaintance with nature itself.

LEAD AS IODATE.—Mr. C. A. Cameron, in a paper which he has read before the Society of Analysts at Dublin, states that as a result of experiments, he has found plumbic iodate absolutely insoluble practically. Iodic acid and alkaline iodates precipitate lead far more perfectly than sulphuric acid, even when alcohol is added to the latter. The plumbic iodate formed is weighed, or, if a volumetrical inertia be desired, the following is the process: Precipitate with standard solution of soluble iodate, and filter off the plumbic iodate. The filtrate and washings are to be mixed, and the excess of iodic acid contained in them estimated volumetrically by the hydrochloric acid and hyposulphate method. As it is almost impossible to procure pure iodic acid or potassium iodate, the solution of iodate must be standardized by means of a solution of pure nitrate of lead. Owing to the slight solubility of plumbic iodate in alkaline chlorides, iodies and bromides, none of these salts must be present. HCl rapidly dissolves iodate and lead.

MOVEMENT OF TEMPESTS.—M. Faye has studied tempests as moving whirlpools with vertical axes, comparing them to the eddies of streams. In the course of a river, as soon as there is any difference of velocity between contiguous portions of water, such eddies tend to be produced. As soon as the tendency becomes effective, it can be mathematically shown that the angular velocity of rotation increases in the inverse ratio of the square of the distance from the axis. Moreover, although the eddy is plunged in the mass of the surrounding water, it will remain isolated, as it were, by the surface of its own, which is a surface of revolution around the vertical axis, with the concavity of its meridian generatrix turned downward.

TRICHINOSIS IN BADGERS.—It is well known that rats and mice sometimes harbor *trichinæ*, and that larger animals eating their flesh become infected. The London *Farmer* announces that a correspondent of the *National Zeitung*, writing from Guben, states that a badger recently shot in that neighborhood was found on examination to be infested with *trichinæ*. It was by accident only that this discovery was made, one of a company of sportsmen who had determined on supping on the animal in question having amused himself by submitting a portion of its muscular fiber to microscopical examination. We have badgers in this State, but we have never heard of *trichinæ* being found in them. Microscopists who have badger meat available should look for the parasites. Meantime, let those who eat badger meat cook it well.

NOT A TARANTULA'S NEST.—At the late meeting of the San Diego Natural History Society, Prof. Kleehurger made some remarks upon the tarantula of California, and stated the distinction between the tarantula (*Mygale Hentzii*) and the trap-door spider (*Cleniza Californica*), and wished to correct the popular error that the nest with trap-door found thereabouts is a tarantula nest.

RADIANT ENERGY.—We learn from exchanges that Harper Brothers are about to publish a book entitled "Scientific Memoirs," by Dr. J. W. Draper, being a concise account of this distinguished chemist's contributions to a knowledge of radiant energy. From the host of his brief contributions to scientific literature, Dr. Draper has selected such papers only as relate the effects of radiations, and has condensed them into still narrower space than they originally occupied. A few among the special points herein determined are as follows: That ignited solids yield a spectrum that is continuous, not interrupted; that it is not the violet rays, commonly called the "chemical rays," but the yellow rays of sunlight, by the action of which carbonic acid is decomposed by plants; that all the colored spaces in the spectrum are equally warm, and that while the violet produces a certain chemical effect, it does not stand alone in so doing, but that all the other rays accomplish their special changes also; and that the circulation of sap in plants is due to sunlight. The first photograph from life was made by Dr. Draper, and he obtained the first photograph of the moon. In fact, it is astonishing to see how many important discoveries are due to a single active laborer in the scientific field. These essays are mostly short, but they contain descriptions of all the chief experiments by means of which the author's points were determined. To those who are interested in the history of spectrum analysis, or photography, or the effects of the sun's light in many directions, the book will prove to be a notable acquisition.

THE SPINAL CORD.—One of the most remarkable cases in the history of surgery is that of ex-Sheriff Van Blascom, Hackensack, N. J. He was thrown from a buggy and had his neck dislocated. Few, if any, cases are on record where such an accident did not result in instant death. The spinal cord is the main channel of vital force, and in dislocations of the neck is either ruptured or so injured that all organs cease to act immediately. In Van Blascom's case the spinal cord may have been disarranged sufficiently to have produced unconsciousness, which, had it continued, would have resulted in death. The dislocated bone, however, was set, when the patient immediately returned to consciousness. In other words the spinal cord, not having been materially injured by displacement, continued its functions as soon as returned to its normal position. The case is not only a curiosity in surgery, but also a suggestive element in the problem of life.

A COMPREHENSIVE ENCYCLOPÆDIA.—The great Chinese encyclopædia, recently purchased by the British museum at a cost of $7,500, is voluminous indeed. There are 5,020 volumes all told. The commissioners, who executed this work in 40 years, professed to have taken all works from about 1100 B. C. to 1700 A. D., and it is supposed that the whole Chinese literature of any importance between those dates is to be found embodied in these 5,020 volumes. The subjects are classified under six headings, under which are arranged writings relative to the heavens, the earth, mankind, inanimate nature, philosophy and political economy.

DAUBREELITE.—Prof. J. Lawrence Smith, of Louisville, Ky., has recently made analyses of the new meteoric mineral, daubreelite, the discovery of which he announced in 1876. From his present experience he has reason to believe that further research will show the constant presence of daubreelites in meteorites. The mineral occurs in small nodules mixed with troilite; it is black, scaly in structure, and is composed of 68 parts of sesquisulphide of chromium to 29.75 parts of sulphide of iron, closely approaching the formula $FeS + Cr_2S_3$

NOTE ON THE SOLAR SPECTRUM.—Prof. J. C. Draper, in a paper contributed to the *American Journal of Science and Art*, places on record recent researches on dark lines in the solar spectrum, which possess a close relationship in position to the lines of oxygen, slight differences that exist being within the limits of error of experiment. His researches lead him to believe that to prove the presence of oxygen or other substances giving faint lines in the solar atmosphere is a problem which cannot be solved by the comparison of two spectra of small dispersion.

BEN NEVIS AS A METEOROLOGICAL STATION.—Mr. Milne Holme, chairman of the Meteorological Society of Scotland, has ascended Ben Nevis and made several observations with a view to erecting a station on the summit. He found the top enveloped in a mantle of snow. It is proposed to construct the building after the following plan: first, a wall of stone with an inside lining of wood and an inner coating of felting, and the outside of the wall to be covered with corrugated iron. An external wall of stone would also be erected to serve as a protection from the blast.

BARCENITE.—Huitzuco, State of Guerrero, Mexico, says the *Iron Age*, is the locality of a new mineral, barcenite, described by J. W. Mallet of the University of Virginia. It is black, finely granular and often porous, opaque and with a dull, earthy luster. Its specific gravity is 5.3 and its hardness, 5.5. The mineral holds 20.75% of mercury and 50.11% of antimony; it is a mixture apparently of sulphide of mercury, antimonic acid and an antimoniate of calcium, mercury and antimony.

Mining Share Market.

The tendency of the market to rise towards tbe close of the week has been shown again. Accidents in mincs and reports of developments of water or ore no doubt affect the price of stock. But some of the movemente of the market appear eo utterly senseless that it is perhaps about as well to expect the move in cycles governed by the time only as to try to study out any relation between the news from the mines and tbe etate of the market. The Comstock mines still hang upon the Sierra Nevada honauza. The fact that the stocks waver as rumors are whispered about of the state of negotiations between Skae and Flood argues a hope that with the full development of the great ore body, the neighbors will be pulled up in the market along witb it. In ehort that sympathy will serve the same purpose as higb assays in those mines that have no immediate prospects.

The Bodie mines have shown a general rise. Perhaps the operators are growing tired of the Comstock. Tuscarora mines also showed an upward movement. One case of traceable relation between newe and prices is exhibited in Eureka Con. The breaking of the spur wheel has led to the fall in the stock.

No new dividends have been reported this week, to our knowledge. Bullion shipments havs not heen hackward.

Inspection day on the Comstock has passed, and still no startling news.

PACIFIC COAST POSTAL CHANGES.—Offices estahlished—Rye Valley, Baker county, Oregon, William Blaine, Postmaster; Key, Thurston county, Washington Territory, William Shuman, Postmaster; Brown's Park, Summit county, Utah, John Parsons, Postmaster. Offices discontinued—Low Gap, Meudocino county, Cal.; Providence Wells, Pima county, Arizona. Postmasters appointed—Sylvanus Gardner, Erie, San Benito county; J. C. Morrison, Lindale, Modoc county; W. E. Fifield, Madison, Yolo county; M. L. Landrum, Peach Tree, Monterey county; J. B. Datel, Sherman, Santa Clara county, Cal.; Gaines M. Adams, Hood River, Wasco county, Oregon; Chas. A. Connelly, Leeds, Washington county, Utah.

IT is suggested that the condition of the British markets renders possible a sharp demand upon us for gold, to he obtained hy returning American securitiee other than United States honds.

IT is etated that the Union and Central Pacific railroads have completed arrangements with all the Eastern lines hy which California freights will he loaded separate in full car loads, and cars run through with hut one transfer.

THE grain crop of lower Puget sound will he mucb larger this year than for any previous season. The yield has been much less per acre than last year, hnt the acreage much larger.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

TO BE TRIED AGAIN.—*Dispatch*, Oct. 26: The Markle mine, near Volcano, a few years ago one of the prominent quartz mines of this county, hut siuce abandoned hy its former owners, an English company, has been taken possession of by a new company, who, we understand, will commeuce working it agaiu at an early day. The mine is thought to be a very valuahle property if properly worked.

A MINE REVIVES A TOWN.—Ouce thrifty little Scottsville is beginning to again assume a life-like appearance, in consequence of tho flattering prospects of the Moore mine. A new office for the company is almost completed, steam hoisting works are being put up, and ground is being levsled upon which to erect a new water-power quartz mill.

HAPPY STOCKHOLDERS.—It is stated on good authority that ths quality of rock taken from tho Monterichard, continues to grow hotter and hetter every day.

PHENIX.—The 80-stamp mill is running to its full capacity. The rock is said to hs as rich as at any time in the past. A new shaft is sinking south of the south shaft.

BUTTE.

CAPITAL COMING BUT MORE WANTED.—Oroville *Record*, Oct. 26: The mining prospects of the county look brighter and hrighter, day after day. The mines that are now heing worked are yielding as well as ever they did, with good prospects for the future. The extensive gold fields just across the river that have only heen waiting the strong hand of capital to put them in working order, when they would pay rich returns, have now passed into the hands of some of the richest men of this State. Work will soon he commenced with a view of bringing in a large volume of water that may be used in any direction from the top of South Table mountain that it may be wanted. We predict that mining will he carried on inside of a year, at double the rate that it now is in this county. Men of money are now owners of these mines and they intend to open them at once. There is still room for others to purchass good mines that never will pay one dollar until water is brought in, and then they will pay large rewards.

MONO.

ALWAYS CHEERING.—Bodie *Standard*, Oct. 23: The week passed has witnessed the erection of a numher of new hoisting works and an unprecedented amount of work done on different properties. The most cheering results have heen reached in many of our mines, and indications point to a numher of honanzas in the near future. The great drawhack has been the want of lumber, and if our mill men do not hurry up and fill their orders, we fear that a number of promising mines will he ohliged to discontinue work for want of proper cover for their men. The Standard mill, under the competent management of James M. Dawley, continues to reduce the usual quantity of ore from the Standard mine, and the weekly shipments of gold hullion goee forward as regularly as ever. Ths reports from the Bodie, Bulwer, Blackhawk, Con. Pacific and others of our leading mines are of the most encouraging character, and add additional assurance of the permanency of our camp.

BEN BUTLER.—This mine was located Sept. 18th, 1878, and has heen worked hy Wilson and Ben Butler and Roger Horner. Some samples of ore from this mine taken from a depth of 40 feet from the surface contain large particles of "ferniform" gold, and also much free gold sprinkled generously throughout the specimens. A ehaft is heing sunk on the ledge and will be continued to an indefinite depth. The Ben Butler is west of the Last Chance and uorth of the Excelsior location.

DOUBLE STANDARD.—This recently incorporated company has heen taken in charge hy W. A. Skidmore, mining expert, who will push work forward with his accustomed energy. It is located on the south extention of the Standard and the South extension of the Summit and Linden mines. The ground is 300 feet in width and 1,500 in length. Work has hcen done hy a shaft 80 feet deep, at which point a ledge was struck about three or four feet wide of very fair quartz. It is intended to commence the sinking of a new shaft which will he at once pushed to the depth of from 200 to 300 feet, when it is expected a rich gold-hearing vein will be encountered.

BOOKER.—C. T. Singletary has assumed charge as superintendent and has commenced energetically to push matters forward. The main shaft is now down 210 feet from which points levels are heing started. The hottom of shaft is fine looking quartz which looks promising in the extreme.

MARYLAND.—This mine is situated on Queen Bee hill, east of the University and Booker. The work of development is bcing done hy sinking a main shaft which is now going down on a four-foot vein. The quartz found promises well. The property has heen incorporated and has heen placed in charge of G. H. Howard. Work will continue through the winter months.

MONO AND CROSS CON.—Shaft down 91 feet. Have heen making fair progrese during week past. The character of the rock has not changed materially, but still looks well.

RICHER.—The south winze is down 42 feet, to a point where qnite a body of water has been struck. Still sinking in winze, and evsrything looking favorahle for a good pay streak of orc.

DITCH COMPLETED.—For the past two weeks the Standard mill and miuing company have had men sngaged on a water ditch, leading from tbeir mill a distance of 4,500 feet to Barney's canyon, north of town. The spring from which the water was turned into the ditch will afford a three-inch supply the year round. Fear of want of water is thus dispelled, and now it can be safely aseerted that the Standard mill will pound away on ores through winter and summer, spring and autumn.

ITEMS.—Oro from the University mine, worked in arastra 12 years ago, gave from $30 to $48 per ton in gold. A two-foot ledge has been cut in the west crosscut, 480-level, of ths McClinton. The Summit ledge is 2½ feet wide, good orc. At a depth of 65 feet in the Ajax new shaft a two-foot vein was struck. The Staudard has at least two ledges exposed, two and three feet wide respectively. Fine ore and favorahle indications in the Bodie. Rich ore heing extracted from the Con. Pacific. Ledge matter, eight feet wide and prospecting well, in South Bulwer. Bulwer shows at least two ledges, 15 inches and three feet wide reepectively. Two very promising veins to he opened up in the Orient. Two etringere of quartz in White Cloud, one of them prospecting slightly in gold.

NEVADA.

CLEANING UP.—*Herald*, Oct. 26: The North Bloomfield Gravel mining company have heen engaged for the past few daye in making a complete clean-up of their tunnel and undercurrente. They make this complete clean-up about once a year. The upper part of the tunnel, where the flumes are, is cleaned up about every three weeks, heing accomplished in a day, hut to clean all the tunnel and undercurrents it takes about a week. It will he remembered that this tunnel is over one and a half miles long. The water is turned off at the upper end of their ditches, which are over forty miles in length, and the work of cleaning the gold out of the tunnel and arranging for another run is gone through with. Their undercurrents extend from the mouth of the tunnel aloug the mountain side dowu to the South Yuha. It is expected that this clean-up will yield an immense amount of bullion.

NEVADA COUNTY MINING ASSOCIATION.—Grass Valley *Union*, Oct. 26: This is the name of a new mining organization recently perfected in Grase Valley, intended for general miuing operations. It has takeu a one year's lease on the North Star mine (the French lead) and will do some work the present season, hut any extensive work or the erection of machinery will he postponed until next snring.

SWISS-AMERICAN. — *Union*, Oct. 26: The perpendicular shaft which is being sunk on this new mine is down 80 feet, and is now in hard hlasting ground. At the depth of 100 feet a crosscut will he run to the ledge a distance of about 25 feet, when sufficient hacks will he obtained to give at least a year's work. Another shaft has heen put down on the workings of the ledge, and has reached the depth of 50 feet. Whsn a good face of quartz is reached in this shaft a winze will he sunk down to a connection with the perpendicular shaft, through which the quartz will be raised. The water in the mine is not troublesome, and is easily handled hy the machinery.

ANOTHER MINE REVIVED.—*Herald:* Forlorn Hope is the name of a quartz mine located west of Rough and Ready. It was worked about two years ago and some very good rock taken out, hut it has for some cause eince that time, until quite recently, lain idls. Its owners have now gone to work on it, and the first part of the week they came across eome rich rock. The vein is prohahly a pocket ledge, hut the pockets when found, are very rich. The quartz is of a neat white color, and looks very handsome, interspersed with gold. The specimens make very neat jewelry, for which use the last find was priucipally sold.

ITEMS.—Lafayette No. 2, a prospecting company on Oshorne hill, has hsen taking out some fine looking rock which shows well in ore and free gold. The Cold Spring mine has good prospects. The Manzanita mins is preparing to uss 1,300 or 1,400 inches of water next season. Centennial is sending another hundred load lot of ore to the Orleans mill for crushing. This ore always pans out well. The Godfrey gravel mine on Alta hill, is regularly running and they are taking out some quite rich looking hlue cement which requires crushing, occupying a five-stamp mill regularly. The Scadden's Flat new mining company have purchased extensive machinery for hoisting and pumping works and are putting the same in shape for a thorough opening up and working this well-known mining property. The Derhec, drift gravel miue, is working a force of 35 men now and putting on more as the drifts are opened. The machinery used for hoisting and pumping is laige and first-class, and the gravel yields from $6.50 to $13.50 per ton. Winze No. 3, in the Watt mine, is now down 15 feet. Bedrock was struck at a depth of 12 feet, and the striking of the channel is a mere matter of days. The work of raising for the gravel deposits in the Planet has begun. A recent crushing of 48 loads of rocks from the Alpha yielded $1,082.72 in gold, or $22.55 per load.

PLACER.

TO BE DETERMINED.—*Herald*, Oct. 26: The mining interest in the neighhorhood of Wisconsin Hill seems to be somewhat at a standstill. There are two large ditches which bring water from Shirt-Tail canyon during the winter, affording water for the working of a few hydraulic claims; hut the deposits of gravel are irregular, and chopped up by deep canyons. There has becu considerable prospecting, as on every side may he seen open cuts which have been commenced in the hills, hut which are now abandoned. The future prosperity of Wisconsin Hill, as an extensive mining section, is yet to be determined. It is to hs hoped that the enterprise of the miniug community will yet he rewarded.

ABANOONED TWICE.—Soms thirteeu years ago thero was a mine opened in the vicinity of Michigan Bluff, which was then known as tho Bird's Valley mins, and for some time was worked with moderate success, hut for some cause was abandoued. After the mine had remained idle some time the attention of other individuals hecame directed to it, who determined upon re-opening the old mine, which they did, and worked it with similar succese as the parties who first opened it, and soon it again becams ahandoned. Some time since this same old mine was opened by a Mr. J. C. McCook, who is now working it with hetter success than any of his predecessors. Ws have often heard it said that the third time is the charm, and so it proves to he in this case, as wo are credibly informed that Mr. McCook took out in two days two tons of rock which will yield $75 to the ton. The hest part of it is that the prospect for its continuance is good.

PLUMAS.

GREENVILLE NOTES.—Quincy *National*, Oct. 26: Mr. A. McIntyre has purchased a half-interest in the Antelope mine from F. A. Murphy. This mine is about one-fourth of a mile from the New York mine. McIntyrs will mill the Antelope rock in the New York mill, and also the rock from tbe Wiles claim. The latter mine is also about three-fourthe of a mile from the New York, and was formerly worked by Mr. S. Wiles, who sold out to a stock company. The company ran some 400 feet of tunnel, and McIntyre has hought most of the company out, and is ready to take out pay rock as soon as he completes a new grade from the New York mill to the mine. Mr. M. will also start up the old Union mill to work the Hidden Treasure rock.

SHASTA.

COPPER CITY.—Reading *Independent*, Oct. 18: The Extra company have made their regular shipments of hullion the past week, and propose to keep doing so the entire winter, regardless of rain or snow. There are about 15 teame hauling ore from the Potter mine, on Bully hill, to the mill. The Northern Light mine continues to yield rich ore in ahundance, and have a fine pile of high-grade ore on their dump ready for the mill. This company will build a mill in the spring, if not eooner, as they have plenty of ore now in sight to keep a 20-stamp mill running.

TRINITY.

A MINING ENTERPRISE.—Weaverville *Journal*, Oct. 26: The new company which is operating near McWhorter's place on lower Trinity is to he known as the Dixon Bar M. Co. Dr. P. W. Fonda, who has been superintending operations, tells us that everything is progressing nicely, and that ditches, flumes, etc., will he completed in time to commeuce running at the opening of the water season. The company have excellent prospects, and it is to he hoped their efforts will he rewarded with success. Dr. Fonda left here for Oakland last week; during his absence Mr. Charles Tucker bas charge of the company's affairs at Dixon Bar.

GOOD PROSPECTS.—It is reported that Joe Watrous and his partner have found very fair prospects on the headwaters of the north fork of Trinity, about 15 miles above the town of North Fork, near what is known as Blue Ridge. Coarse gold has heen found in paying quantities, soms pieces weighing as high as $12.

TUOLUMNE.

THE REWARD OF PATIENCE.—Sonora *Democrat*, Oct. 26: The Harris mine, situated at Whisky hill on what is known as the mother vein, is proving to he a very valuable property. It is another of the many instances whsre large amounte of money havs been expended hy capitalists in opening veins to he ahandonsd as costing more than they would prohahly come to. Some years ago Gen. W. S. Rosecraus and others prosecuted work on the mins now owned and worked hy Mr. Harris, resulting in ahandonment. After it was ahandoned the presnt owner took it up and quietly worked several years until he was satisfied he had a good mine. This summer he built a mill and is now reaping the reward of his patience and industry. Thie week he cleaned up a run of 12 days, of 12 hours sach, resulting in a yield of several thousand dollars. There is room on Whisky hill for a number of mines on the same vein, which can be traced quite a distance, that there is reason to helieve will prove as rich as this one.

NEW MILL.—A five-stamp mill with capacity for 10 stamps was commenced at the Evans mine this week. It will he huilt under the superintendence of James Tullock.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—Gold Hill *News*, Oct. 30: The south incline has reached the 2200 level, at which point cutting out a station is well under way. This station is heing cut out in the porphyry on the east side of the shaft and ore

Continued on page 284.

Rotary Dry Ore Concentrator.

Mr. E. W. Stephens, of Erie, Pa., has employed his ingenuity in adding another dry ore concentrator to ths fast increasing list of that class of machines. His invention is the result of practical observation and of experience in the concentration of lead ores. The Erie *Dispatch* describes it as follows:

The machine is an iron frame supporting an endless belt of wire cloth, which, by means of pulleys, is passed over an ore bed in which a horizontal blast plate or fan acting vertically, oprated by a lever and spiral spring, gives intermittent air impulses at a rate not exceeding 500 strokes a minute to a stratum of ore resting upon the cloth, thus affecting a concentration of the heavy minerals contained in the ors from the associated rock, by the action of specific gravity. The specific gravity of rocksand is about 2½, of iron ore 6, galena 7½, copper 9, silver 9, and gold 19. The material in order to be treated over an air concentrator must first be crushed to about the size of wheat, then dried iu oveus, and then divided into separate sizes by sieves or screens. This ends the preparation of the ore. After being passed over ths concentrator and the mineral separated from the rock, skimming knives at the forward end of the machine separate the concentrated strata as the wire cloth belt is revolved, the lightsr passing over the knives into one receptacle, and the heavier mineral passing below the knives into another receptacle stationed at convenient distances in front of the machins. The capacity of a machine having a 2 by 3 feet blast-plate or fan would be six and a half tons per hour. It is claimed that this is many timcs in excess of the capacity of any ore separator of similar dimensions hitherto in use.

In other dry ore concentrators, similar to that tested by the Pacific Concentration Company last November, the ore is compelled to pass over a stationary ore bed, thus limiting the capacity to a practical working of about 1,000 pounds per hour. In this rotary machine, however, ths ore remains stationary npon the ore bed and is then concentrated and removed from it by the revolution of the endless belt, aud the capacity is practically uulimited, as it depends entirely upon the length of the belt, which may he mads to pass over a frame containing a series of an indefinite number of blast or fan plates. It is claimed that a length of 60 feet of belt exposing about 20 feet to the simultaneous action of the fans would bs the best practical working capacity. The capacity of such a machine would bs about sixty tous an hour, aud the cost of concentration, exclusive of preparatory work, would in that case not exceed five cents per ton.

It is intended for use in separation of all mincrals associated with a large quantity of rock, such as lead, copper and eilver, and also for iron ore where found associated with sand as it is iu a number of counties in this State, in the Lake Superior region and at points on the Atlantic seaboard, and in the separation of gold sands. It is claimed that the advantagcs of air over water as a separating medium for ores, is very decided on account of the superior elasticity of air, rendering it practicable to give four times the number of impulses per minute that can be given by water and also the freedom from lateral current, which iu the case of the finer sizes of ores causes great waste.

Falling in of a Mine.

An exchange publishes a letter dated Scranton, Pa., October 10th, which gives the followiog account of the accident to the ooal mine reported briefly by telegraph a short time ago.

A destructive caving in of the extensive Diamond coal mine is causing much consternation on the Hyde Park side of this city. The crash was announced several days ago by a series of rumbling sounds in the roof of the mine. These signals, indicating the unsettled condition of the overhanging rock, became eo loud and constant that on Wednesday morning the men were forbidden to enter the mine except to remove their tools. This task was attended with some peril. The mine has three working veins, the lowest of which is 350 feet deep. About 90 feet of rock separated the upper and middle veins, and a similar partition existed between the middle and lower, before the caving in occurred. When the men entered for their tools they found all three veins in a dangerous condition, and in the bottom one the pressure was so great upon the props that the iron T rails, on which they rested, were in many instances bent and nearly reached the roof. The men could feel the rails moving beneath their feet nnder the great strain.

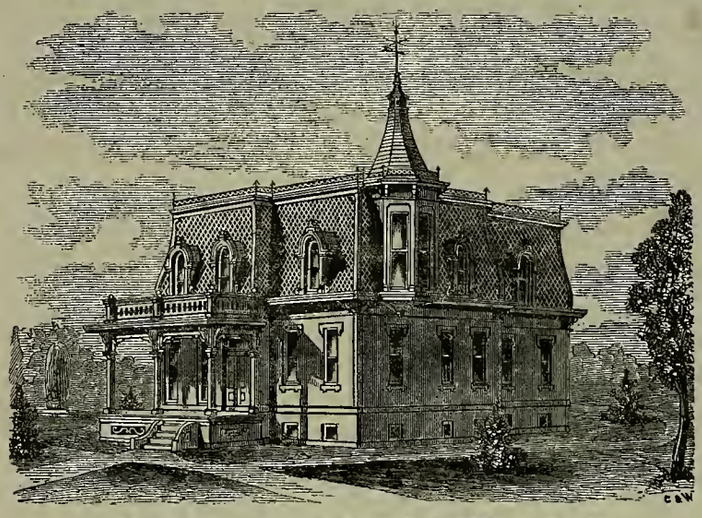
The crash occurred about one o'clock this morning. A gang of workmen who had been on the watch desoribe it as terrible in its effects. The three veins caved in simultaneously, with a roar that was deafening. This sound wae repeated a number of times, like thunder-claps, while, in the midst of the din, a euccession of short, sharp reports, like those of a rifle, kept up a regular fusilade. The caving in covers an immense area, and will cripple the mine for many months. The plane by which coal was lowered from the middle of the bottom vein, to be hoisted through the main shaft, was oruehed, together with its eugines and hoisting gear, and about 300 feet of the main gangway road filled with rock. The mine is still in convulsions, and will not settle for several days. A large flood of water, walled into some old workings, may possibly bs released, and if it is will flood the entire colliery. The disaster throws about 400 men and boys out of employment. The Diamond mine is the first ever sunk in this section by the Delaware, Lackawanna and Western Company, and its coal is the best in the valley.

GAS-WELLS.—An East Liverpool (Ohio) correspondent of the Cleveland *Leader* says of the natural gas-wells of the former city: "They form one of the seven wonders of the world. They are situated in and around the city, and give it a continual supply of the finest light. The gas is almost as free as the air. It costs practically nothing, and forms the illuminator and heater of the town. The city is lighted by it, and the street lamps blaze away at noonday as well as at midnight. It costs nothing to let them burn, and it takes trouble to put them out. Its light is not the flickering mockery of poorly-manufactured gas, but a flame which approximates in its brilliancy that of the electric light. Almost the entire fuel used in the town is this gas. It is conducted into the grates and stoves in pipes, and by it all the cooking and heating are done." It is also used in furnishing steam power for many of the largest pottery and ironstone china manufacturing establishments, 22 of which are in operation and busily engaged, employing over 2,000 hands, and which it is considered justly entitles East Liverpool to be designated "the Ceramic City" of America. Regarding the duration of the supply from these wells, it is stated that "the first well discovered now burns as brightly as when it was first opened, and for the last 20 years has never flagged in its briliancy, and none of those now in operation have ever shown any signs of giving out. For years Liverpool used manufactured gas, never dreaming of the rich supply that was wasting away daily under its very feet." The poor quality of the manufactured product induced the opening of the first well in 1859. This well, which is 450 feet deep, "has been furnishing fuel and light to several houses, producing the steam for a large engine and burning pottery kilns every day for nearly 20 years."

ENGLISH LOCKS AT PARIS.—We recently stated that United States lockmakers were far in advance of all competitors at the Paris exposition. English manufacturers, however, show some interesting things. In one lot of locks the keys are ornamental in the extreme. One of these—valued at £50—is 17 inches in length, the work of the bow, in silver and gold, being very delicate and intricate. Another is a copy of one made for the late Queen Isabella, of Spain, set with rubies and diamonds. A key concealed in a gold signet ring, and one in an oyster-shaped gold locket are curiosities worth looking at and worth using. An oddity ie a model in German silver of the fish adopted as the trademark of the makers cleverly fashioned into a look, with keyhole under a fin, and bolt shooting out of the mouth.

A Neat Dwelling.

In the planning of honses and the ornamentation of their exteriors and interiors, there is wide room for ths application of individual tastes. What would please one homs-maker would not another. In our choice of dssigns to present to our readers, we have made a wide diversity in styles that each might choose according to his liking. The designs which we give on this page is another from the establishment of Isaac H. Hobbs & Son, architects, of Philadelphia, Pa. It is quite different from the light aud airy cottage exteriors which we have given before. It is rather more severe in outline; the feature of the building being the French roof. It is qnite flat above, but the upper rooms are kept from overheating by the downpouring of the snn's rays, by leaving an air-space between the roof and the ceilings of the upper rooms. It is estimated that the house can bs built of frame, as shown in the plans, for $2,500 where materials is of average cost.

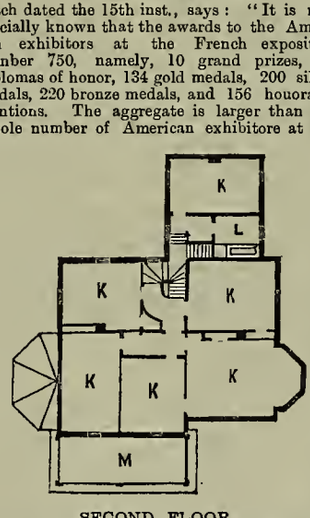


DESIGN FOR A COTTAGE WITH A FRENCH ROOF.

The floor plans are sxplained as follows: *A*, hall, 8 feet wide; *B*, parlor, 18 by 20 fest; *C*, library, 14 by 16 feet; *D*, diniug room, 14 by 16 feet; *E*, chamher, 12 by 14 feet; *F*, kitchen, 16 by 17 feet; *G*, chiua closet; *H*, porch.

In the second floor, *K* represents the chambers; *L*, bath room; *M*, veranda.

FIRST FLOOR.



SECOND FLOOR.

THE UNITED STATES AHEAD.—A Paris dispatch dated the 15th inst., says: "It is now officially known that the awards to the American exhibitors at the French exposition number 750, namely, 10 grand prizes, 30 diplomas of honor, 134 gold medals, 200 silver medals, 220 bronze medals, and 156 honorable mentions. The aggregate is larger than the whole number of American exhibitore at the Paris exposition of 1867, or at the Vienna exposition of 1873, and is a larger proportional award to exhibitors than to any other nation represented at this exhibition."

GOLD IN WASHINOTON TERRITORY.—It is reported that the Swank mines are doing well this season. New leads have been discovered and more are, so to speak, "on the way." The diggings are worked principally by Chinamen, who lately shipped from $80 to $100 each to their respective companies in Portland. Some fine nuggets have been produced by the mines. The Fehastin quartz mines are paying well. About 25 men are engaged at these mines and six or seven small mills are iu successful operation.

PLACERS and quartz mines are reported lively in Lynx Creek district, Arizona. Extensive deposits of stone coal have been discovered about 30 milee from Brigham City, north of the Little Colorado, Arizona.

New Incorporations.

The following companies have filed certificates of incorporation:

RED JACKET CON. M. Co.—Devil's Gate district, Storey and Lyon counties, Nevada. Capital—$10,000,000. Directors—D. L. Thomas, John Crockett, Philip Henkle, H. O. Reinhardt and A. D. Snedeke.

SULTAN HILL M. Co.—Indian district, Mono county. Capital — $10,000,000. Directors—Sumner D. Prescott, Joseph Wasson, E. C. Locke, T. E. Jewell and Clinton Gurnee.

BODIE LION M. Co.—Mono county. Capital $10,000,000. Directors—J. M. Gitchell, A. C. Dietz, William A. Phillips, J. L. Sanford and A. C. Hendley.

ALPHA H. GRAVEL M. Co.—Nevada county, California. Capital—$1,000,000. Directors—David Morrow, James F. Haycock, Thomas Redwayne, Alex. Girvin, W. H. H. Hamilton and James Ireland.

EAST SIERRA NEVADA CON. M. Co.—Storey county, Nevada. Capital—$10,000,000. Directors—Solomon Heydenfeldt, A. J. Holmes, B. B. Minor, G. Holland and G. R. Ghisclin.

NUMA M. Co.—Trinity district, Humboldt county. Capital, $10,000,000. Directors—W. M. Pierson, E. W. Blasdel, A. M. Bnrns, N. Dupera and B. Block.

MOUNT ROSE M. AND M. Co.—Mount Rose district, Humboldt county, Nevada. Capital—$10,000,000. Directors—F. A. Huntington, M. P. Ivory, S. P. Pharis, S. F. Curtis and W. T. Robinson.

BUNKER HILL DISCOVERY Co.—Mono county. Capital, $250,000. Directors—E. B. Cooper, Benjamin J. Haslett and Alexandsr Warfield.

PIONEER Co.—Capital, $10,000,000. Directors—Charles Land, J. M. Byrne, W. H. Wallace, N. H. A. Mason and E. Straus.

GLYNN DALE CON. G. M. Co.—Capital, $10,000,000. Directors, F. B. Taylor, George B. Hubbard, Irving M. Scott, F. Home and John Neale.

EAOLE G. AND S. M. Co.—Capital, $10,000,000. Directors—George A. Gates, A. C. Mc.-Skinner, W. D. Kock, W. J. Richardson and N. Mason.

CON ASTOR M. Co.—Capital, $10,000,000. Directors—C. L. Weller, J. Landers, A. Andrews. Cameron H. King and Frederick A. Roe.

TIGER G. AND S. M. Co.—Pyramid Lake district, Nevada. Capital, $10,000,000. Directors—James Ward, J. C. Pray, George Eggsrs, P. L. Archibald and A. J. Jeffers.

BUTTE H. M. Co.—Capital, $23,000. Directors—George W. Deitzler, Ephraim Chaquette, M. Ls Duc, Chas. L. A. Laplant and A. Redovan.

SOUTH BELVIDERE G. AND S. M. Co.—Mono county. Capital—$10,000,000. Directors—H. H. Hubbard, J. W. Young, Jr., George M. Condee, A. J. Adams and D. W. Douthitt.

BULLETIN M. Co.—Bodie district. Capital—$10,000,000. Directors—A. Judsou, John Yule, R. Woods, W. H. High and Z. T. Adams.

TRUE BLUE M. Co.—Lake district. Capital—$10,000,000. Directors—Johu Neale, S. M. Holmes, J. T. Davis, C. A. Genning and C. A. Wisely.

BRIGHT STAR G. M. Co.—Kern county. Capital, $10,000,000. Directors—P. T. Colby, J. M. Gitchell, H. F. Scott, H. H. Pearcon and Delos Lake.

OAKLAND CON. G. & S. M. Co.—Location: California. Capital, $6,000,000. Directors—Charles E. Fairbank, Jamee Gibson, R. W. Granniss, John Curtie and I. W. Lent.

HAPPY VALLEY B. G. AND H. M. Co.—Location: Calaveras county. Capital, $300,000. Directore—James Ireland, M. E. Austin, David Morrow, A. D. Allen and J. C. Warren.

SILVER HILL T. M. Co.—Location: Bodie district. Capital, $10,000,000. Directors—Thomas Steele, A. A. Babb, F. F. Sturges, A. L. Tracey and J. B. Mackle.

PRINCETON MARIPOSA G. M. Co.—Location: Mariposa county. Capital, $15,000.000. Directors—S. Heydenfeldt, Mark Brumagin, I. W. Raymond, S. Heydenfeldt, Jr. and John W. Brumagin.

LORD BEACONSFIELD G. & S. M. Co.—Location: Bodie district. Capital, $6,000,000. Directors—John D. Barry, John Moss, G. E. Smith, J. W. Harding and J. C. Chalmers.

PACIFIC COAST PETROLEUM Co.—Location: San Mateo county. Capital, $50,000. Directors—Alfred E. Davis, Edward Barron, A. B. Rowley, George H. Waggoner and B. B. Minor.

THE LAKE VIEW M. Co.—Capital, $10,000,000. Directors—John Neale, S. M. Holmes, John T. Davis, C. A. Gennng, C. A Wilsey.

IRONCLAD CON. M. & M. Co.—Directors—R. H. Lloyd, Benjamin Prindle, George J. Smith, John Cammet, John H. Cammet. Capital, $10,000,000.

GOLD LEAD G. & S. M. Co.—California and Nevada. Capital. $10,000,000. Trnstees—David Porter, F. Bonancina, J. W. Walls, A. Charles and W. Williams.

CENTRAL CON. G. & S. M. Co.—Mono county. Capital, $10,000,000. Trustees—J. H. Canavan, I. E. Richards, John Martin, W. B. Leith, and R. M. O'Neil.

ONE of the wire cables on the California Street Hill railroad, San Francisco, has been stretched so that its diameter is reduced from one and one-fourth to one and one-eighth inches.

THE first discovery in the Santa Rosa mining district, Silverado, was made in August, 1877, by Messrs. Purcell & Slankard. The district wae organized the same month.

The Mines and the Courts.

Interesting to Mine Jumpers.

The Commissioner of the General Land Office, in refusing the application of certain parties to be allowed to re-locate the American Hill quartz mine, announced the following new and important rulings.

First—A mining claim is not subjected to re-location subsequent to its entry for entry.

Second—A failure to perform the labor or make the improvements required by Section 2324 of the Revised Statutes, between the date of entry and the delivery of a patent, does not work a forfeiture of the rights acquired by entry, nor demand its cancellation, when such failure is brought to the attention of the General Land Office by such re-location or otherwise.

Third—The annual expenditures named in Section 2324 are required to support the possessory title only.

Fourth—The objection from third parties, which, by the last clause of Section 2325, may be heard, relate only to the conditions of the purchase, and not to those of possession.

Buying Washed Wildcat Stock

Samuel Geddins sues N. H. A. Mason to compel the payment of a promissory note for $15,000. The note was given in payment for 1,000 shares of stock in the Geddes & Bertrand M. and M. company, owned by the plaintiff, who, it is alleged, falsely represented that the stock was worth $4 per share in the San Francisco Board, and that there was on the dump of the mine not less than 1,000 tons of ore, valued at $100 per ton. Defendant avers that he believes that none but "wash" sales of this stock were ever made in the Board, and that it was, and now is, without any market value. The stock not having been transferred to his name upon the books of the company, defendant claims the note was given for no consideration.

A Bonanza Suit Again.

John H. Burke, on his own behalf and all other stockholders of the Con. Virginia M. Co., brings suit in the Twenty-third District court against J. C. Flood, J. W. Mackay, J. G. Fair, the Pacific M. & M. Co., and the Con. Virginia M. Co., to compel Flood, Mackay, Fair and the Pacific Mill Co. to account for and restore to the Con. Virginia Co. all moneys paid out for milling the Con. Virginia ore, amounting to $6,000,000; for the tailings, amounting to $20,000,000, and for $15,000, the value of certain lots in Virginia City, conveyed by the Directors of the Con. Virginia M. Co. to to the Pacific Mill Co. on the 7th of January, 1875. Total, $26,015,000. The rights of action is based on sections of the Civil Code of California, which prohibit the trustee from dealing with the Trust Fund for his own profit, or making contracts with himself, as decided in the recent case of Wilbur vs. Lynde, 49 *Cal.*, 292, "That the law will not permit one who acts in a fiduciary capacity to deal with himself in his individual capacity, and that express contracts thus made are contrary to public policy and void."

Commission for Selling a Mine.

W. H. Howland brings suit against I. S. Van Winkle to recover $7,500, commissions as broker for the sale of the "Nevada mine," or the "Soggs mine," so called, which plaintiff alleges he sold on the 7th of August last for $75,000, the defendant agreeing to pay a reasonable commission for such brokerage.

European Mountain-Climbing Railways.

The journal of the Hanover Society of Civil Engineers and Architects, for this year, contains the report of a lecture by one of its members, Mr Grove, on the several mountain railways built in Austria and Switzerland within the past eight years.

The track is made of two channel irons, spaced 5 inches, in which plays the cog-wheel of the engine, 4-inch face, and 4 seconds pitch of cogs. The Wasseralfingen road alone has a 3 2-10 inch pitch. The cogs are shaped as evolutes of a circle, so that a variation in the depth to which they take into the track do not affect their regular action. On the Rorschach-Heisden road the track is elevated above the ties on two stringers, leaving the space open under the rounds of the ladder-like central rail, so that snow may fall through or be pushed through by the cog-wheel. This seems to have worked well, even solid ice having been thus pushed out from between the cogs. The latest roads have the track fastened to the ties by suitable castings instead of by longitudinal stringers.

Switches were at first built after the manner of turntable (are so now on Mt. Washington railway), but have recently been constructed similar to other switches by Mr. Klose, of Rorschach. The circumstances of the cog-rail being elevated above the other rails, simplified the construction of this switch materially. The common rails are switched as ordinarily, and the cog-rail is gradually widened, the rounds being bent at the same time, so as to remain normal to each side-bar at their ends until the rail has attained double its usual width, when it is continued as two separate cog-rails.

Various methods have been devised for enabling the locomotives to work by adhesion of their smooth wheels, as well as by means of their cog-wheel drivers, and by means of either at will. No one of these has been permanently successful, however, so that the proper construction of a double engine of this sort is still a matter of experimental inquiry

Useful Information.

A New Artificial Stone.—We read that a process has been invented by H. G. Hosmer, of Rome, which differs from previous processes in the fact that limestone in the solid state is employed as the base instead of a mixture of plaster and cement. The limestone is worked by any suitable means to the desired form, and is then placed in a boiler furnished with a safety-valve and manometer, so that the pressure therein may be noted and controlled as may be required. The boiler is then filled with pure water at the ordinary temperature, care being taken that there is no mineral deposit introduced with the water, and that the water completely covers the objects placed within the boiler. The boiler is then hermetically sealed, and fire applied, and the water allowed to boil until the manometer indicates 5 degrees of atmospheric pressure if the objects are small, and 6 or 7 degrees of pressure if the objects are large. When the heat reaches the above mentioned point the water is allowed to cool until the pressure indicated by the manometer returns to zero. The water is then taken out of the boiler either by means of a pump or a siphon, and the objects are removed from the boiler preparatory to being placed in the alum or colored bath, various receipes being given for different colors.

Prices of Eastern Railway Stocks.—The following is from an account of an auction sale of railway stock in Philadelphia: "How much for 3,123 shares in the Huntington, Cambria & Indiana?" asked the auctioneer. There was an ominous pause, and nobody seemed inclined to make a venture. "Come, come," pleaded the auctioneer, "give me a lead." "One-eighth of a cent per share," piped a weak voice, and a burst of laughter followed. Then there was another pause, until another auditor went one better and bid a quarter cent. The auctioneer rapped and talked in vain after this, and the quarter cent bidder finally became the purchaser. Four hundred and eighty shares Indiana & Ehenshurg went at three-quarters of a cent; 360 Armstrong & Indiana, 154 Clifford & Wilkesbarre, and 200 shares Gap & Newport were knocked down at one cent; 100 shares of Anderson's Ferry, Waterford & New Haven started at one-quarter of a cent and ran up to four cents, at which figure they went off. The prices of the remainder of the stocks averaged all the way from one and a half cents to $5 per share, the latter being obtained for 1,060 shares in the Perkiomen & Reading.

Furniture Polish.—The following is from the *Journal of Chemistry:* Put three gills of cold-drawn linseed oil into a quart bottle with 16 drachms of aquafortis, and fill up with vinegar. This mixture is invaluable for furniture that has been French polished, but is getting the worse for use, or, it may be, abuse; and also when wood, having been only partially seasoned, the resin rises up through the polish, causing unsightly cracks and spots. This the aquafortis in the mixture eats down, and restores the work to something of its original brightness. To use it, first wash the furniture thoroughly clean with a sponge and lukewarm water, shake the bottle well and rub on the polish, being careful to use only very clean cloths. Old rags do best, as they will not wash after being used with this mixture, and are only fit to be thrown away. For furniture that has never been French polished, nothing is better than the old-fashioned beeswax and turpentine melted together by a gentle heat, and applied with plenty of elbow-grease.

Artificial Manganese.—*Iron* says that artificial pyrolusite has been produced by Mr. J. B. Hannay, of Manchester, in the following way: When manganous nitrate is dissolved in strong nitric acid and warmed and a few chips of potassic chlorate added, there is precipitated in the liquid black oxide of manganese in the form of flat plates, which, when very thin, are of a beautiful purple, but when thicker are of a red color. The whole of the manganese is precipitated in this form, but when the strength of the acid and the temperature are made to vary, the distribution of the plates may be changed. When the acid is very concentrated and the temperature only about 20°, and the mixture allowed to stand for some days, the dioxide of manganese is precipitated in plates (and sometimes needles) radiating from a center, and arranged so that when fractured and viewed with a low microscopic power, they look exactly like natural pyrolusite. The specific gravity is also the same, being 4.935.

Improvement in Bending Timber.—The bending of hard wood, especially beech, is effected at present by means of hot water or steam, a process somewhat costly as regards fuel, and taking a long time. A patent has recently been taken out in Germany by Babse and Haendel for making sieve hoops and like objects by a dry process, more cheaply and in shorter time, from cut wood. Two rollers are used, one above the other, and having less velocity, so that the upper acts by holding back, while the lower extends the wood fibers. When the board, thus bent, leaves the rollers, it is fastened in the mouth of the sieve. The upper roller is fluted, the under one smooth. If two smooth rollers were used a very much greater pressure would be necessary.

Ballooning in the Arctics.—Prof. King, the celebrated æronaut, has just concluded, at Scranton, Pa., a series of experiments with his new balloon gas-generating apparatus. The generator is of cylindrical shape, five feet and a half in diameter, and 10 feet in hight, and Prof. King claims for it a capacity to inflate a balloon of 90,000 or 100,000 of cubic feet volume. The experiments were made at the instance of Capt. Howgate, the well-known polar explorer, with the view of adopting it for service in arctic exploration. When Prof. King first announced his invention, M. de Fouville, the eminent French æronaut, in a series of letters to Capt. Howgate, expressed the opinion that Prof. King's plan was entirely impracticable. Notwithstanding this advice, Capt. Howgate determined upon a test of the apparatus, and sent a special delegate to be present at the Scranton experiments. This gentleman, who has now returned to Washington, reports that they were entirely successful, and Capt. Howgate says that if his colonization plan is carried out the King apparatus will become one of the auxiliaries in the exploration.

Chinese Penalty for Adulterating Tea.—The practice of adulterating tea with willow leaves has been brought under the notice of the Governor of Foochow by the Chamber of Commerce of that place. As the result an official proclamation has been issued threatening the delinquents with severe punishment. Those at the head of the scheme, it recites, are numerous, and any person who proves the guilt of one of them will receive 100 piasters. "Let all," it adds, "tremble and obey."

Trade Position of the United States.—As a remarkable feature in the world's commerce at the present time, it may be noted that the United States is the only country where its exports exceed its imports with the exception of India, which has a small trade balance in its favor. The increase in the importations of Europe is principally in breadstuffs, the United States being the great source of supply for European deficiencies in that line.

Prevention of Incrustation.—We learn from the *Manufacturer and Builder* that the process of Dr. de Haen for preventing incrustation in steam-boilers, consists in the treatment of the feed-water with the proper amount of harid chloride and milk of lime, as determined by quantitative analysis, seems to grow in favor for locomotive and stationary engines, and is to be employed for the 310 boilers of Krupp's steel foundry at Essen.

To Polish Steel.—Mix half a pound of fine emery powder with the same quantity of soft soap, and add a small piece of soda. Simmer this over a slow fire for two hours, to extract all the moisture. Rub on with flannel, and finish with plenty of dry whiting.

Good Health.

Sanitary Funerals.

In an article on this subject in the New York *Independent*, the writer remarks as follows: First of all, every person that dies should have a thorough washing of the whole body. To two quarts of warm water it is best to add one pint of the chlorinated soda of the shops known as Labarroque's solution. A half pound of chloride of lime stirred into the same quantity of water and allowed to settle, and the water poured or strained off, will do as well. A large wad of cotton or a small bag of sawdust mingled with a pound of chloride of lime is well placed under the hips after washing.

The whole process by which the Jews prepared a body for burial may well be imitated in our modern times. The washing was followed by the application of spices to the corpse in the form of ointment or within the folds of linen. Our recent chemical analysis show these spices as not mere odors, but as disenfectants, in their essential oils having the very same combinations that we use less pleasantly. The handaging of the body closely and neatly in these spices up to the head, which was covered separately, served to encase the remains, so that coffins were rarely used, and, if used, were open. The changes which take place in a dead body within three or four days after death are such as diminish any danger from the body itself, and need to be counteracted only as would any other moderate contamination of air.

It is to be remembered, too, that the contagions which attend upon certain diseases are not so apt to be transmitted by a dead body as by the clothes upon it or around it, or by the room which has become infected during the life. If, for instance, a child deceased of scarlet fever has undergone proper disinfecting ablution and bandaging for burial, and is conveyed to a church or other building, we do not believe any case of disease contracted therefrom can be authenticated. We are sorry to have to criticize the action of some health boards in insisting upon private funerals in so many diseases. To lose dear ones and to have city boards advise all people to avoid you but increases the sorrow of the loss. It is a time for sympathy, which cannot be expressed by distance. If it can be shown that there is danger, then surely we bow to the exigency. But if not, we insist, harm is done by too sweeping ordinances. Let us rather mark well the lines of safety. With sanitation of the body within reach and indicated by the laws of a right cleanliness, let it be known that the danger is not in the body that is dead, but in unaired or non-disinfected rooms, garments and surroundings. More good comes to society by such facts than by interdicting attendance. In contagious diseases children may not be exposed to the room, but there is no danger in the properly preserved body.

Charcoal in Dentifrices.

A correspondent, who is a practical dentist of large experience, sends the *Journal of Chemistry* the following note: I notice a paragraph from the *Chemist and Druggist*, referring to the use of different substances for dentrifice, which states that the "microscope pointed out that every particle of charcoal had proved to be a small crystal, which, acting by attrition, was hurtful to the enamel." If attrition or friction were the only objections to the use of it as a dentifrice, I imagine the consequence would not be very harmful; but it is absolutely dangerous on other grounds. Of course its antiseptic properties are not questioned, but the most serious danger arises from its pernicious effects upon the gums and soft tissues. I might add that in extreme cases the alveoli or sockets of the teeth are not exempt from its effects. It may be laid down as an invariable rule that no substance should be used as a dentifrice that contains acids or any ingredients insoluble in the secretions of the mouth. Now with regard to charcoal, the microscope reveals the fact that, no matter how finely pulverized, it is composed of minute angular crystals. These are absolutely insoluble in the mouth, and when used they work up under the free margins of the gums, and the more loose and diseased these are the greater the danger. The little carbon crystals gets imbedded in the soft tissues, acting as a constant source of irritation which is followed by inflammation. A chronic state is reached; the gums become swelled; pus exudes from their margins; and absorption of gums and alveolar processes, with ultimate loss of the teeth, is the sequel. Of course extreme results are produced only by habitual use of the article. I think all observing dental practitioners of any considerable experience will bear me out in the above statements.

Boxing Children's Ears.—The practice of boxing children's ears is a most dangerous one. Professor Stanich, aurist, in a letter to the Timaru *Herald*, says: "As one single instance, in Canterbury I have found no less than four children in one family affected with serious deafness. One of these little ones had the drums of both ears absolutely broken, which means, of course, incurable deafness. The parents assured me that they never struck their children, but that it was in school that the boxing of the ears, which had had so fatal results, had taken place. I understand, also, that more than one schoolmaster in Timaru is in the habit of resorting to this barbarous practice as a means of punishment, and who—unwittingly, no doubt—will be answerable for many a case of deafness in years to come, when their present pupils will have reached manhood or womanhood." When the barbarous practice of beating children in school is resorted to, preferring a charge of assault against the teacher would have a moderating influence. If children are utterly disorderly they should be expelled the school, and the onus of punishment thrown on the parents, who, if they neglect the proper correction of their children, would have the pleasant reflection that the reformatories or training schools would be the places to which incorrigible children would be sent.

Warm and Dry Feet.—Life long discomfort and sudden death, writes a medical man, often comes to children through the inattention or carelessness of the mothers or nurses. A child should never be allowed to go to sleep with cold feet; the thing to be last attended to is to see that the feet are dry and warm. Neglect of this has often resulted in dangerous attacks of croup, diphtheria, or fatal sore throat. Always on coming from school, on entering the house from a visit or errand in rainy, muddy, or damp weather, the child should remove its shoes, and the mother herself should ascertain whether the stockings are in the least damp. If they are, they should be taken off, the feet held before the fire, and rubbed with the hands till perfectly dry, and another pair of stockings and another pair of shoes put on. The reserve shoes and stockings should be kept ready for use on a minute's notice.

How to Kill a Tapeworm in an Hour.—Dr. Karl Bettelheim, of Vienna, narrates, in the *Deutsches Archiv*, a heroic method and nearly sure cure in the short space of time of three quarters of an hour to two hours. It is this: He inserts a tube in the œsophagus, to the stomach, and pours down from 200 to 400 grammes of a very concentrated decoction of pomegranate root, having previously had his patient fast for 24 hours. The worm is stupefied, and passed, head and all, to a certainty; the patient has no sickness of the stomach, and no nauseous swallowing to do; and the drug is cheap.

A Long-Lived Mechanic.—Mr. Richard Rogerson, of Liverpool, is spoken of as a model English workingman. He is 77 years old, and has worked in a foundry for one firm for the last 66 years.

TABLE OF CONTENTS.

GENERAL EDITORIALS. — Artesian Wells—No. 4; Mines and Works of Almaden—No. 7, 273-284. The Week; Water Assays; The Gas Inspector's Report; 280. Boswell's Pure Air Heater, Cooker and Fruit Dryer; 281-2. Patents and Inventions; Notices of Recent Patents, 284.
ILLUSTRATIONS. — The Almaden Mines; Artesian Wells, 273. Design for a Cottage with a French Roof, 278. Boswell's Puro Air Heater, Cooker, and Fruit Drier, 281.
CORRESPONDENCE.—The Golden Fleece Gold and Silver Mining Company; The Silverado Mines; The Niagara Gold and Silver and Copper Mining Company; Mining Patents to Foreigners, 274.
MINING SUMMARY from the various counties of California, Colorado, Idaho and Nevada, 277-84.
MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 276
NEWS IN BRIEF on page 285 and other pages.
MECHANICAL PROGRESS.—The Philosophy of a Chip; Sheffield Cutlers Using Bessemer; Hardening Steel Tire Flanges; American Competition in Europe; An English Mining Pump; The Mechanical Chessplayer; English Tribute to American Inventive Genius, 275.
SCIENTIFIC PROGRESS.—Getting Close to Nature; Lead as Iodate; Movement of Tempests; Thichinosis in Badgers; Not a Tarantula's Nest; Radiant Energy; The Spinal Cord; A Comprehensive Encyclopædia; Daubrcelite; Note on the Solar Spectrum; Ben Nevis as a Meteorological Station; Barcenite, 275.
USEFUL INFORMATION. — A New Artificial Stone; Prices of Eastern Railway Stocks; Furniture Polish; Artificial Manganese; Improvemeut iu Bending Timber; Ballooning in the Arctics; Chinese Penalty for Adulterating Tea; Trade Position of the United States; Prevention of Incrustation; To Polish Steel, 279.
GOOD HEALTH.—Sanitary Funerals; Charcoal in Dentifrices; Boxing Children's Ears; Warm and Dry Feet; How to Kill a Tapeworm in an Hour, 279.
MISCELLANEOUS.—Danger in Use of Tanks for Drinking Water, 274. Rotary Dry Ore Concentrator; Falling in of a Mine; Gas-Wells; English Locks at Paris; A Neat Dwelling; The United States Ahead; Gold in Washington Territory; New Incorporations, 278. The Mines and the Courts; European Mountain-Climbing Railways, 279.

NEW ADVERTISEMENTS.

Russell's Amalgamator, J. Morizio, General Agent, S. F.; Belting and Lacing, H. Royer, S. F.; Delinquent Notice—Summit Mining Co., J. W. Clark, Sec'y, S. F.; Paul's Barrel Process, Almarin B. Paul, S. F.; Assessment Notice—General Allen Silver Mining Co., M. C. Southard, Sec'y, S. F; Vulcan Blasting Powder.

The Week.

The shafts have been eunk, the tunuels have been finished, the drifts have been run, the powder-chambers excavated and charged, and now the reports of tremendous blasts reacb us, telling their tale of "good execution" and vast tracts of gravel prepared for the next season's washing. The ditches are being finished and in all the placer regions the miners are looking confidently toward the time when the rains shall come. In fact from all the mining regions, in and out of California, the news is colored with sanguine hopefulness. Shasta promises an early increase in gold bullion shipments. Silverado has all the buoyancy of youth. Bodie is quietly settling down to the work of developing her many locations, while new claims are weekly recorded. The Comstock shows nothing of special interest this week. The great mines of Eureka seem to be fated. The Richmond reducing works are not yet repaired. Yet here comes news of the shattering of one of the big spur-wbcels in the Eureka Con. mine, which accident must check developmeuts, though it probably will not eeriously affect the prospects of the old dividend-payer. Idaho appreciates the good that may he done a district hy keeping its mines before the world, and her press is energetically furnishing "points" on the possibilities and probabilities of her mining industry. In this particular Colorado ie least backward, and she reaps her reward, when Eastern capital comes pouring in to bond the claims of her impecunious miners. A few weeks ago "Leadville" was the Colorado cry. Now it is "Silver Cliff," and the rush of men to the new chloride find threatens to wane the former, less enticingly named excitement. Arizona is increasing her bullion capacity daily.

Water Assays.

The prospector, as be trudges about some new country, carries along with his frying-pan and coffee-pot a little article that is more necessary to his profession than these, and more characteristic than the hoot-tucked overalls and the slouched hat, the good-natured independence and the hlunt honesty. Without a horn-spoon or its equivalent, his outfit would he incomplete, and where he cannot use a horu-spoon he is not likely long to remain. The horn-spoon or the pan in the hands of a skillful miner is the type of many a concentrator that has cost weeks and and months of some inventor's anxious time. All the motions of the miner as he squats on the hank of a stream and shakes his pan or spoou from side to side, and taps it on the hottom, and scrapes ahout in it with the fingers of the unoccupied hand, have been studied, and attempts have been made to reproduce them in machinery. But though very perfect concentrating machines have been made, it is douhtful if any one of them has the power to "justify," to use a printer's expression, that is found in the original, in the pair of miuer's arms shaking an old horn-spoon.

The prospector owes mucb to this primitive apparatus, or, expressing it more precisely, to the sorting power of water and the differences in specific gravity of the materials he meets with. Yet when the prospector settles down into a regular miner, he forgets what a convenient appliance he has at his hand, even in an old wash-basin and a few hucketfuls of water. An assayer steals into the camp, rigs his tent, or his split-stave shanty, huilds his chimney, arranges his hottles of myeterious laheled fluxes, hangs out his shingle, and pockets fees for doing what, in many cases, the miner might, with the help of his old proepecting companion, accomplish quite as easily himself. In short, a fire assay, or a complex chemical assay, has taken the place of a simple and costless water assay.

Everyone, who has thought at all of the matter, knowe that theoretically at least, it is quite possihle to separate the various constituents of a complex powder, by using merely the sorting power of water. This might even be carried so far as to determining the exact amount of each conetituent of the original powder. And what is theoretically possible, may he realized in practice after the outlay of a little patience. Water assaying is not applicable universally—no other method is—but it may be applied with so many ores, aud is so very simple and cheap, that it is a wonder that it has not come into common use bcfore now, especially as scientific men have worked it up into quite a complete system.

In the last issue of the PRESS, an article was published in which a new form of batea, or gold washer's pan was described, and directions for the use of the pan in general, were detailed. The latter were taken from an English author, and from an article pnbliehed some time ago by a scientiet well known among us. However, perhaps tbe most complete system of water assaying ever prepared, was studied out aud published years ago, by a gentleman of great experience on our coast. In a work, California can claim the honor of, by J. S. Phillips, published in San Francisco, as early as 1869, a systematic account is given of the wide application of the eorting power of water in making qualitative and even quantitative assays. To show the extended applicability of this method, we will take an example from the work in question. A pulverized sample is taken, containing, let it he supposed for the sake of illustration, all of these following substances: Free gold, metallic copper, metallic iron, oxide of tin, eulphuret of iron, red oxide of copper, eulphuret of lead, gray sulphuret of copper, yellow eulphuret of copper, sulphuret of zinc and oxide of iron, associated with their matrices of quartz, clays, feldspars, carbonates of lime or magnesia and others of similar specific gravities and friability. The apparatus needed at the etart is three ordinary saucers and a good supply of clean water. Instead of saucers, almost anything of approximately similar shape may be used; as cups, soup basins, prospecting pans, horns or horn-spoons. A systematic and skillful use of these may result in the separation of very many of the constituents; and the further application of simple tests, will complete a very reliable assay of the eample.

This method of assaying is to be recommended to miners, not only on account of eimplicity of its apparatus, any of which can he picked up about an ordinary mining camp, and its economy, but also because it gives the miner a more correct idea of the exact constitution of his sample than any other method cau give him. An ordinary analyst can tell you the elements in an ore, but in a vast number of cases he can only "*judge*" of the manner in which thoee elements are combined. But in the water assay, the combinations themselve and not the elements, are separated from each other and recognized, furnishing an excellent guide for the subsequent working of the ore, as well as accurate knowledge of the exact percentage contained of any one element that may be sought for.

The water assay demands of the operator a knowledge of the appearance of minerals in a powdered etate. To make it of greatest use to him, the operator must have eome little knowledge of chemistry, hut this applies rather to the final tests than to the water-assaying itself. And whenever the ores to be dealt with are free from that coufusion so common in volcanic regions, "the *chemically* nnednoated prospector and miner has at his fingers' ends an exacting, practical test," of which he may avail himself at will. Mr. Phillips alludes in a great numher of places throughout his work to the value of this method, not only for various discriminations, hut for the actual assaying of many minerals and metals, as galena for per cent. of lead, oxide of tin for per cent. of tin, gold both hy water and water and fire, etc., etc.; and lastly gives a novel and very valuable combined method for a close assay of gold-hearing quartz by hlow-pipe, after water concentration.

He favors treatment in a porcelain vessel, where acids and final drying are required, and where drying only, the miniature gravel miner's pan of about eight inches in diameter, as the wooden "battea" is not adapted for either of these important purposes.

The Gas Inspector's Report.

The Gas Inspector, appointed under an act passed by the last Legislature, made his report to the Board of Supervisors last week, the document presented heing one of great interest to consumers. By a curious mistake, however, tbe Inspector has been liberally ahused hy the daily press of the city, for presumably having made a report more in the interest of the gas company than that of the city he is supposed to represent. This seems still more strange when in reality the report shows the San Francisco Gas Co. in a worse light than any of those with which it ie compared.

The *Call*, *Bulletin*, *Alta* and *Chronicle* ask for the dismissal of the Inepector because "he says gas cannot be made in this city for less thau $3.07 per thousand feet;" and several wise editorials have appeared in those journals, with remarks based on the figures quoted, to show how little the Inspector knew about his hueiness, and how much he deserved to he ousted from his position. This would all be very well if Mr. Bloomfield had ever made any such statement in his report, which, however, he did not, so the criticisms havc all beeu based on false premises.

We do not know Mr. Bloomfield personally, and have no reason for attempting to defend his position, hut we bave read his report with some care and know that he has beeu misrepresented. Probably some careless reporter iu glancing over the report saw the figures $3.07 in that portion where he comments on the fact that in order to be able to pay divideude on excessively watered stock a high price ie charged. These figures, without the comments, then got into the papers, since whicb time the editore of the journals referred to have been pitching into the Gas Inspector, without even troubling themselves to examine the report, or the thought occurring to them that they might be mistakeu and not the Inepector.

The Gas Inspector does *not* say that gas cannot be manufactured in this city for less than $3.07 per thousand. The report distinctly eays that it is not his province to dictate to the Commissionere what shall be the price, regulations and restrictions, etc., but to lay hefore them all the facte and data to assist them in arriving at their conclusion. It then goes on aud takes the market prices of *material* here and ehows that the *cost of producing* 1,000 feet of gas ought not to exceed $1.09, as follows: Coals, $9; labor, $2.25; lime, 54 cents; distribution, $1.80; total, $13.59. From this subtract value of residuals: Coke, $2.76; coal tar, 80 cents; ammoniacal liquor, 20 cents; total, $3.76. Thie leaves $9.83 for carbonizing one ton of coal which produces 9,000 cubic feet of gas; or for 1,000 feet, $1.09.

He then says: "To this cost should be added a fair amount for dividends on the capital stock and for taxes. Now, the greater the amount of capital invested, or claimed to be invested, of course the greater will be the amount required to pay taxes on that capital, and consequently the higher the price to be paid by the consumers." The following extracts from the report will show this more clearly:

"In this case (that of the San Francisco company) having a company which sells 511,922,690 cubic feet per annum, or, in other words, a capital of $19.50 for every thousand feet of gas eold, there would be required the sum of $1.76 on each thousand cubic feet of gas sold to pay a dividend of 9%; and consequently the price of the gas, even with the reduction in the coet of manufacture made as above, would run up to $3.07 per thonsand cubic feet, made as follows:

"Cost of manufacture.....	$1.09
Taxes.....	.22
Amount necessary to pay dividends.....	1.76
Total.....	$3.07

"It will readily be perceived from the above that this high price ie due chiefly to the large sum required to pay dividends. And this is caused by the excessive amount—$19.50—of capital stated per 1,000 feet of gas sold, which, as may he eeen from a preceding tahle, is twice as much as that of the next highest on the list, the New Haven company, and over 13 times that of the Washington Gas company.

"Let us assume, therefore, a company manufacturing gas in this city with a capital per thousand feet of gas sold in about the same ratio (after making due allowance for difference of value here and East) as tbat of the Eastern companies and see what its price would he:

"The New Haven Gas Co. presents the most unfavorable conditions for the consnmers, giving $9.70 as the capital per 1,000 feet of gas sold; hut we will take that, and further make an addition of 20% for difference of values hetween here and the East. We would then have $9.70 + 20% = $11.64, or in round numbers $12 capital for each thousand feet of gas sold (instead of $19.50 as at present). This would give for 511,922,690 cubic feet of gas sold per annum, a capital of $6,143,071, instead of $10,000,000. Our figures would now be as follows:

"Cost of manufacture.....	$ 1.09
Taxes.....	.22
Amount to pay 9% dividend on $12..	1.08
Total.....	$2.39 ₱ 1,000 ft.

"This result is, as stated, based on an assumed case, but is a fair one, when we consider the experience of the other companies cited. These figures are not given as what the results should he, but are presented in order that the Commissioners may have a hasis of comparison to assist them in their considerations.

"A still further reduction, however, could he made in the price of 1,000 feet if the residuals, which form an important item in reducing cost of the gas, were taken in the above estimates, on the hasis of the prices at which they are advertised for sale; viz: Coke, 50 cents per barrel of 2½ bushels, $4.60; coal tar, $4 per harrel, ammoniacal liquor 20 cents, per ton of coal carbonized. This would make $5.86 instead of $3.76 as the amount received for residuals per ton of coal carhonized."

These quotations from Mr. Bloomfield's report will show that the abuse so liberally dealt out to him is entirely unmerited, and that the papers whicb have published it have placed themselves in a ridiculous position hefore the puhlic, which might have been avoided if they had remembered and been guided hy Davy Crockett's oft-quoted remark, "Be eure you're right, then go ahead." There are many points of interest in the Inspector's report to which want of space prevents referring; hut as soon as it is out of the printer's hands we shall quote from it more lihsrally.

Indian District.

This mining district, situated in that intermediate range of mountains south of Mono lake, has beeu designated as the "country for the next rush." The district was organized as early as 1865, hut, like others that have since become noted, it lay idle for years. Lately, however, the merit of the region is coming to light, and a number of locations have been made. A gold and silver belt strike through the district from north to south, the ledges on which are large. On the silver belt is situated the Tower mine, owned by the Comanche company. The ores from this mine are rich; they are reduced at the company's works at Benton, Mono county.

Indian district is about seven miles west and south of Benton. The latter town is not so high as Bodie, and is accessible at all seasons, the Aurora and Lake district road passing through it. Wood and water in eufficient quantities are at band. The new Bodie railroad will add greatly to the importance of the district.

A corporation has recently been formed for the purpose of developing a number of locations, ten of which have been deeded thereto. The company is called the Sultan Hill, and its office is in room 10, Safe Deposit Building. The list of officers is as follows: Henry Hunter, President; Clinton Gurnee, Vice-President; Wm. H. Raymond, S. D. Prescott and E. C. Locke, Trustees; Henry Cluskey, Secretary. Henry Hunter is the active Superintendeut of the V. & T. R. R, a man of means and influence; Messrs. Raymoud and Gurnee are well known in mining circles. Most of the stock set aside for working capital has been taken at Virginia and Carson, and the work of development will be pushed accordingly. Captain Prescott, an experienced miner (the Superiutendent), having gone to the front with the necessary tools aud supplies, prospecting is brisk in Indian district, and it is eafe to predict that by early spring a new excitement will be added to the already celebrated county of Mono.

MR. HENRY G. HANKS, Commissioner from California to the Paris exposition, returned this week, looking well and hearty. Mr. Hanks, who had charge of the collection of Pacific coast minerals, says that the display attracted a great deal of attention, and that he has been ahle to establish a basis for exchange of minerals which, if the State chooses to take advautage of, will be of great value to us. He has collected material for a very interesting report, which, if the necessary fuuds are furnished hy the State, he desires to publish. Mr. Hanks intends resuming his old business again in thie city as soon as he can arrange his laboratory.

S. R. LIPPINCOTT, general agent for Boswell's pure-air heater, cooker and fruit drier, has removed his office from 307 Pine street, to room 4, Sherman Block, 606 Montgomery etreet.

THE VULCAN Powder Co's Works, advertised in this paper, will he reported in a future issue.

ON the 30th of November an industrial exhibition will be opened in Guatemala.

Boswell's Pure Air Heater, Cooker and Fruit Drier.

We have the opportunity of introducing to our readers something new and very interesting in the line of a combined apparatna for heating, cooking, fruit and clothes drying. In fact, the apparatus, which comes to us very highly recommended by those who have used it, centers in itself all the functions of a kitchen range, a heating stove of great capacity, and a domestic drying apparatus. Thus, with the same arrangement that the housewife heats her house, she can not only cook a dinner, but produce large quantities of dried fruit, and in rainy weather can quickly fit her washing for the ironing board without having wet garments hanging round the house all day and night, as now she is often forced to do. A cheap and handy apparatus, which claims to do all these things well, is certainly worthy of examination. In the one combination of a kitchen stove with a fruit drier there is advantage enough to call for attention, because in all our fruit-growing counties there is need for a cheap drying machine which can be run at small expense and without extra help. If the Boswell heater is found the desideratum which is now so much demanded, it will be worth thousands of dollars in every fruit-growing township in our State.

Fig. 1. Exterior of Heater and Cooker.

Because of these high claims, and because these claims are approved by certain Eastern men whose judgment we are bound to respect, we have decided to give the Boswell heater a full illustration in its different features, so that our readers may examine and learn its adaptability to their uses. We shall include a detailed drawing of its plan of construction, upon which great claims are based.

Fig. 1 shows, in reduced size, the external appearance of the combined heater, cooker and drier. It is neat and ornamental, and its exterior finish is graded according to the large or small amount of money which the purchaser wishes to expend upon beauty. It is in brief a handsome piece of block walnut furniture, with glass doors and lights, etc.

Fig. 2 furnishes a detailed drawing of the interior arrangements when the device is used for heating alone, but from it may also be learned the general design by which complete combustion is claimed to be secured.

The following is the description and philosophy furnished by the inventor: In every style of the Boswell heater, the fire-box or the receptacle for fuel is small, and concentrated with a view to economy and durability. The construction of each fire pot is such, that the fuel is concentrated, and thus produces more heat than is possible in any other way. It will be seen in the cut, that attached to the flue of the stove, is a hollow iron prism, *D*, which radiates to its own center, concentrating the disengaged carbon and hydrogen from the fuel of the fire-box, so causing intense molecular motion in the center of the prism and flue, *C*. The flue, *C*, between the stove and prism is perforated at intervals of half an inch entirely around. Thus it is seen that a concentrated jet of superheated oxygen is thrown on every side of the concentrated carbons and hydrogen or the gases and water of the fuel, and so produces complete combustion. In all other methods of heating, three-fourths of the carbon and hydrogen passes off into the chimney unconsumed.

The fire-box and prism are surrounded by what is termed a shield, *F*, (see cut), with a curved top, *NN*, which is made to open and shut easily and steadily. Between the shields and all along the sides of the stove and prism, is a sheet-iron partition, *R*, called a deflector. It has two offices: 1st, it keeps the atmosphere from contact with the heated irons; 2d, it keeps the heat where it can be utilized. The prism and stove are on the same line, hence the heat is confined on a level of four feet, instead of passing directly up the flue, as in the case in other heaters and stoves.

Fig. 3 is an adaptation of the principle for the purpose of heating only. It is in a wooden, in this State, and that is as a fruit drier. From the engraving can be seen the arrangement of the trays. It is claimed that the employment of deflected heat secures much better results than those obtainable by direct radiation. This point is discussed at length in the pamphlets describing the heater, and we must refer the reader to them. The fruit-drying shelves, as shown in the engraving, are 18 by 23 inches; the heater will hold eight tiers, with two shelves in each tier.

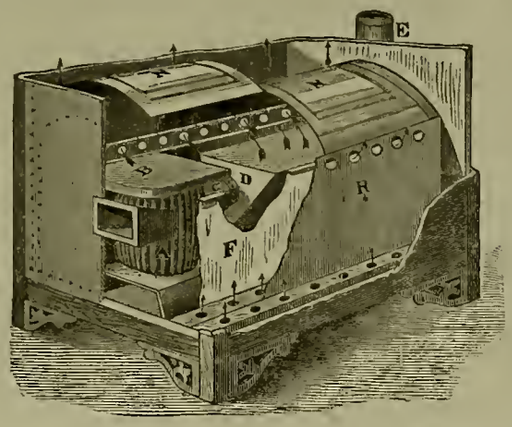

FIG. 2. SECTIONAL VIEW OF ARRANGEMENT FOR DEFLECTED HEAT, ETC.

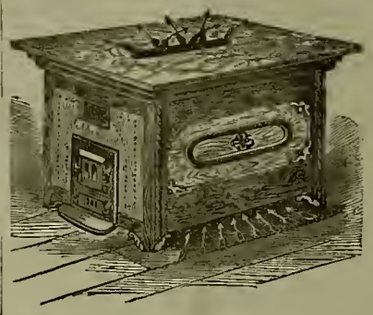

Fig. 3. Exterior of Heater Exclusively

Fig. 5 shows the adaptation of the heater for laundry purposes. The clothes are folded several thicknesses upon each bar, thus one bar is made to hold from three to five shirts, equal to 12 or 20 feet of clothes line. This bar is then placed in the heater, and from five to seven bars can be put in at one time, thus leaving space for the circulation of the rapid currents of heated air. The double currents of deflected heat disengage the vapor with great rapidity, and the steam can be passed up the chimney as fast as it is disengaged, by opening the valve in the escape pipe. Thus the clothes are bleached as well as dried.

Fig. 6 gives a sight of the heater as a baking agency. In baking the superiority of deflected over radiated heat is again claimed. The deflectors are marked *NN*. The effect of deflected heat is said, in brief, to be the only way of thoroughly cooking, and at the same time retain in the fullest degree the natural nutritive qualities of the food.

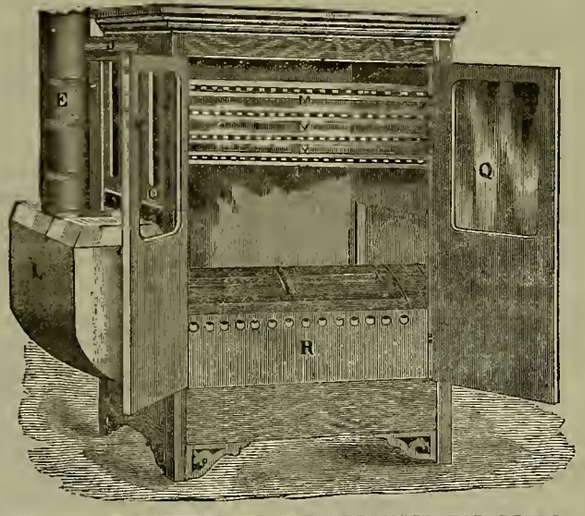

FIG. 4. THE BOSWELL HEATER ARRANGED FOR DRYING.

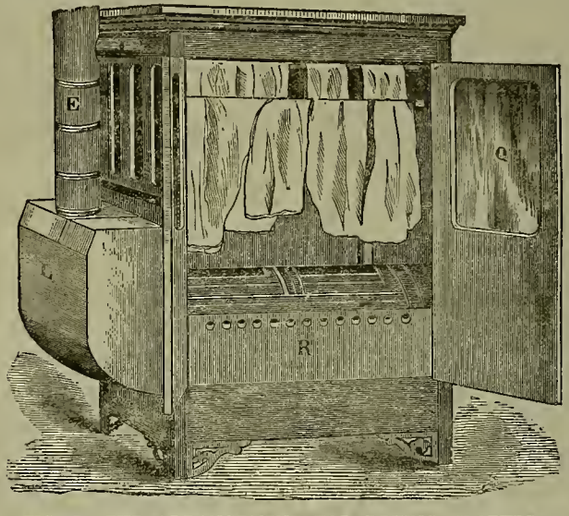

FIG. 5. THE ARRANGEMENT FOR DRYING CLOTHES.

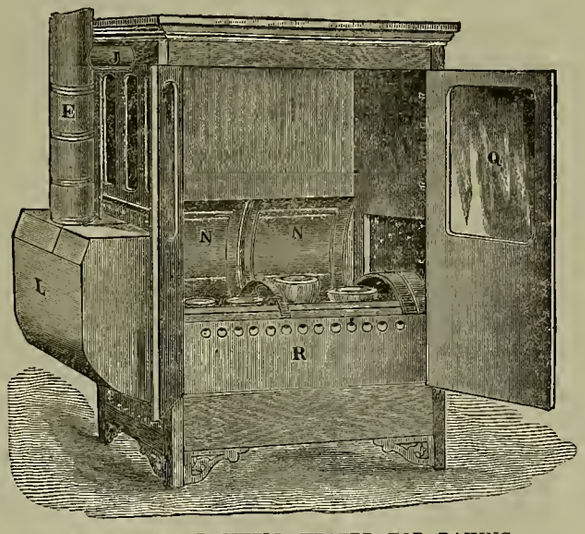

FIG. 6. THE BOSWELL HEATER FOR BAKING.

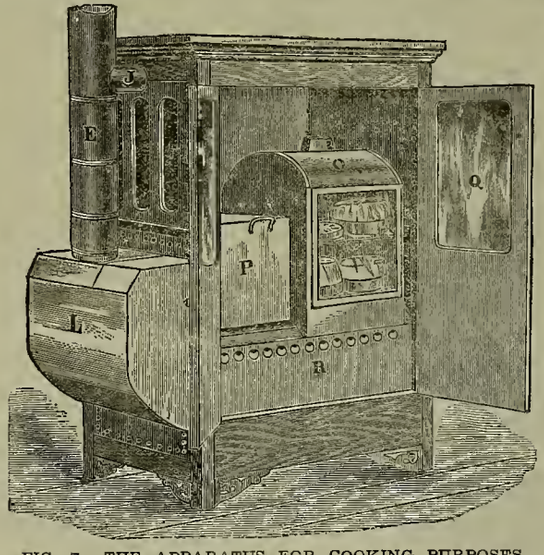

FIG. 7. THE APPARATUS FOR COOKING PURPOSES.

At Fig. 7 the heater appears in full operation as a kitchen range. *O* is the baker, with its different dishes all baking without imparting flavors to each other. *P* is the wash boiler; *E*, the main pipe; *J*, the crosspipe; *Q*, the glass door. The baker, *O*, has a glass door in front. It is claimed that the heater economizes time, labor and fuel, and avoids exposure to heat in cooking, as well as in baking. The person cooking is protected from the fire by the shield and deflector. Steam and odors produced in cooking can be passed up the flue. The kitchen utensils are made of pressed and tinned iron, and are much lighter in handling and can be more easily kept clean, and will last just as long as large, heavy iron pots and kettles. There are no stove lids to lift, and, therefore, no coal soot settles upon your utensils, and there is no danger of having dresses and aprons

In all other methods of heating, three-fourths of the carbon and hydrogen passes off into the chimney unconsumed.

The fire-box and prism are surrounded by what is termed a shield, *F*, (see cut), with a curved top, *NN*, which is made to open and shut easily and steadily. Between the shields and all along the sides of the stove and prism, is a sheet-iron partition, *R*, called a deflector. It has two offices: 1st, it keeps the atmosphere from contact with the heated irons; 2d, it keeps the heat

soiled during culinary operations.

Thus we have shown the Boswell heater, cooker and fruit drier in some of its prominent relations to domestic economy. How well it answers the claims made for it we cannot perhaps do better than cite the experience of Dr. R. T. Trall, of Florence Hights, New Jersey, in his article in the *Science of Health Monthly Magazine*. Dr. Trall wrote as follows:

"When we read the circular of Mr. Boswell, setting forth the merits of his invention, and the various kinds and wonderful amounts of work it would do, we were skeptical. If not too good to be true, we thought it was claiming altogether too much for any one machine which was ever contrived or that can be imagined, and a simple and cheap affair, at that! But on being assured by Dr. D. C. Moore, of Salem, Ohio, who had one of the machines in use, and who had the testimonials of several other parties who had tested and adopted it, that it was all that it claimed to be, we at once procured it. We have now thoroughly tested it, and can conscientiously corroborate all that has been said or pretended in its favor.

"The hygienic principle of the machine consists in the arrangement by which the heat can be deflected through the cooking part and then passed off to the chimney flue; or, by turning a valve, the heat can be used again in warming the room during cold weather; while, by consuming the smoke, the fuel is economized and all contamination of the atmosphere of the room prevented. The surplus heat can also be used again in warming rooms above or adjacent. The proprietor, therefore, does not exaggerate, when he says the saving of fuel during the cold months of the year will equal the cost of the machine.

"In drying clothes or fruit, in heating flat irons, and for heating water or boiling, a more convenient or economical apparatus we are unable to conceive; and for drying fruit or clothes it renders us independent of sunshine or stormy weather. The quality of fruit, which is dried very rapidly, seems to be perfect, and the quality of nearly everything cooked in it is as good as the material employed admits, while many things which are baked or roasted are better than it is possible to make them in common stoves or ranges. In a word, the machine is *just what every family needs.*"

Prof. J. Lawrence Smith, Louisville, Ky., writes:

"The first two weeks I tested its capacity for cooking and washing at the same time for my family, which may be considered equal to an ordinary sized family. I weighed the coal that was used during these two weeks, which amounted to an average of 35 pounds each day (nearly one and one-half buckets of ordinary size) for the cooking, washing and ironing combined. With this same coal the water in the boiler was heated in a most satisfactory manner, furnishing all the water required for washing, bathing, etc. A smaller quantity of coal would have sufficed for the cooking alone.

"As regards cooking, every variety of it has been tried, as boiling, roasting, baking, broiling, frying, etc., and it accomplishes them all in a very satisfactory manner, and that without heating the kitchen as an open range does, or even to a disagreeable degree of temperature. [Written in August, 1877.] I at first apprehended that the broiling would be defective, for I always broiled over a charcoal fire, but my experience with it in this regard makes it no longer desirable to return to the charcoal fire. I have also dried fruit and okra at the same time that the cooking was going on, and with ordinary care find that it does this excellently.

"I have witnessed baking of meat, of bread and of cake at the same time without interfering with each other, or affecting the respective flavors of the different dishes.

"I am satisfied that this cooker accomplishes its manifold results better than any single kitchen arrangement I have ever seen."

We are assured that these estimates of the heater is being rapidly approved, and that at the East, the Boswell heater is coming to be considered as necessary in the household as a sewing machine. It has taken the first premium at all the State fairs in the United States.

The heaters which are sold in this State are of California manufacture. Any farther information which may be desired concerning them may be had by applying to or addressing S. R. Lippincott, Sherman Block, 606, Room No. 4, Montgomery St., San Francisco.

RESTORING BONE BLACK.—A continuous and economical apparatus for revivifying bone black has been constructed by M. Blaise. The used black is thrown into a receptacle of brick through which many smoke tubes pass. The waste gases from the furnace proper pass through them and are thus utilized to dry the used black. The dry black is charged into vertical retorts of enameled terra cotta which hold in their center perforated tubes to carry off the gaseous products of calcination. After 20 minutes' exposure to a cherry-heat the black is allowed to drop into the lower extension of the retorts, where it cools gradually, a fresh charge meanwhile going into the retort just emptied.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

TO OWNERS OF REBELLIOUS ORES.

Persons interested in mines of rebellious ore, or having on hand any ore that is not satisfactorily worked, yielding less than it assays, will do well to notice the following offer. The undersigned is in possession of a new secret process which he is willing to try on any ores sent to him. If a pound or more of ore is forwarded to his address, he will test it with his process, and acquaint the owner with the results and the cost per ton for working. Address,

S. P. BRESSLER, Elkhardt, Indiana.

KING ENGINE.

The Only SAFE BOILER. SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,

18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the tending bucket. The frame of the Power is bolted to wood-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,

18 & 20 Fremont Street San Francisco, Cal

CLAYTON'S AIR COMPRESSORS,

Duplex or Single.

The only Air Compressors which give perfect satisfaction, furnishing more air, with less fuel, than any other Air Compressor.

☞Persons intending to spend a few weeks in the country during the summer months should stop at the Bridge House, on the South Yuba. Accommodation may be had for a few more boarders by addressing MRS. R. H. OULBERTSON, Emigrant Gap. House only one mile on the station.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

HAND PRINTING PRESS WANTED.—Parties having a second hand Washington or other hand printing press which they wish to dispose of, will please address this office stating price, size and condition.

Continued from page 277.

vein, and which as the workmen advance to the eastward is becoming exceedingly bard and bad to work. At the bottom of the sump, 30 feet below the station, in cutting for the sills of the last two sets of timber the same rich character of sulphuret and chloride ore was encountered as has heretofore been described so often. In fact there was not a single favorable feature of the fine ore formation which has characterized the vein since the incline passed the 2000 level wanting. Every indication points to the development of a valuable deposit. Opening the 2100 station has also been commenced, and is making fair progress. The porphyry at that point also becomes very hard as soon as the face of the ore vein is left.

CALIFORNIA.—Daily yield, 300 tons of ore. The main north drift ou the 1650 level has been connected with winze No. 6, passing the entire distence during the week through low grade ore. No work is now being done on the 1600 level. A good supply of wood and other winter material is now on hand and more is being received.

SILVER HILL.—Sinking the main incline is making the best of progress, the bottom still in hard blasting rock. As soon as sufficient depth is attained for a sump, opening the 1100 level will be commenced. The drift south is advancing in quartz and vein material of a fine make, aud which often shows assays of considerable value.

SOLID SILVER.—A station will at once be opened at the bottom of the winze for a drift east to the ledge which it will reach in about 30 feet.

UTAH.—Sinking the main incline is making good progress, the bottom in good blasting ground. A goodly supply of wood and other winter necessaries are being laid in.

SUCCOR.—Sinking the main shaft has been resumed and is making good progress, the rock in the bottom blasting out well and the flow of water continuing light. Work has also beeu resumed iu the drifts and crosscuts on the 1050 level.

OVERMAN.—The erection of the hoisting engine and other machinery at the new shaft is going steadily forward, and will be completed so as to get up steam inside of three or four days more. The framing and erection of the main building is going rapidly ahead. At the old shaft the south drift on the 1600 level has connected with the north drift on the same level from the Caledonia, giviug a much-needed circulation of pure air to that depth. The north drift on the 1600 level is making good progress, but is running in the country rock on the west side of the ore vein.

NORTH CON. VIRGINIA.—The yard and surroundings of tbe hoisting works begin to put on a business look that promises well for the future.

CALEDONIA.—The connection witb Overman will greatly facilitate the work iu all parts of the miue on the 1600 level. The east drift on this level is steadily advancing, the face in porphyry that blasts well.

BEST & BELCHER.—The north drift on the 1900 level from the Gould & Curry has 85 feet yet to run to connect with tbe south drift from the joint Con. Virginia winze.

GOULD & CURRY.—Sinking the new shaft has been retarded somewhat during the week by a change of hoisting engiues becoming necessary. This change will be completed in a day or two more.

OPHIR.—There is but little cbauge to note of any of the prospecting drifts on the 2100 and 2000 levels. The formation in the face of the main north drift on the 2000 level is getting softer, and is interspersed at intervals with streaks of quartz carrying small veins of ore which sometimes assay as high as $40 per ton.

JULIA.—The flow of water is gradually receding aud the entire 2000 level becoming drier. The south lateral drift on the 2000 level is being steadily advanced, the face still in a fine, lively character of vein formation.

ALTA.—The winze below the 1450 level is still in quartz and ore which shows a steady improvement. The east drift on the 1550 level is being pushed rapidly forward to reach the main ore veio at that point.

HALE & NORCROSS.—The 2100 level will be in a condition to permit of the resumption of work in that portion of the mine in a day or two more. The east drift on the 2000 level is being pushed ahead at the very rapid rate of eight feet per day.

MEXICAN.—Sinkiug the joint winze oo the line of the Union Con. is going vigorously ahead, the bottom still in very hard blasting rock. During the first part of the week it was necessary to clean out the drifts and repair the track. Everything is now in good working order. The flow of water from the Union Con. is gradually subsiding. Part is still being taken up by the Sierra Nevada pumps.

UNION CON.—The flow of water from the east drift ou the 1600 level, at noon to-day was reduced to 10 inches. Siuking the joint winze on the Mexican line has been resumed and is making fair progress, considering the extreme hardness of the rock penetrated.

SAVAGE.—The 2100 level is again drained, and work is progressing favorably at all points. The west crosscut on this level is steadily advanciog, the face is still in quartz and low grade ore. This ore assays from $5 to $10 per ton. The north winze below the 2000 level has reached the 2100, at which point a station is being cut out preparatory to crosscutting.

YELLOW JACKET.—On the 2400 level of the old mine the north drift is now in 338 feet; in porpbyry and quartz. The crosscut west from this drift has been discontinued. The new shaft is down 1876 feet, with the bottom in very favorable working ground at present.

CON. VIRGINIA.—The main south drift on the 1950 level is in low grade ore. Crosscut No. 3 on this level is in low grade ore. The east drift from the south end of the ore stopes on the 1300 level has been chenged to nearly a southeast course, and is following a streak of good looking quartz and low grade ore which is running in that direction. Daily yield of ore, 180 tons.

NORTH BONANZA AND FLOWERY.—The east crosscut run in the ore vein from the bottom of the wiuze in the old North Bonanza workings has penetrated a vein ten feet in width of free milling ore, the average assays of which run from $35 to $55 per ton.

BELCHER.—The south drift on the 2360 level is making good progress, the face having day before yesterday cut through the west clay wall of the ore vein, encountering a strong flow of water. In order to avoid this flow of water the course of the drift has been changed more to the westward. No change of importance in either of the crosscuts on this level.

TROJAN.—The average assay value of ore extracted is $34 per ton. The ore stopes on the second station level are showing a steady improvement. The upraise from the north drift on that level is up 52 feet, the face still in quartz carrying occasional spots of ore.

CON. IMPERIAL.—The south winze below the 2400 level is in a fine character of quartz which frequently assays from $5 to $8 per ton.

JUSTICE.—The east crosscuts Nos. 4 and 5 on the 1300 level are still in quartz and ore. Sinking No. 1 winze below the 1300 level is making the best of headway, the bottom still in quartz showiug spots of fine ore. The north drifts on the 1150 and 1225 levels are each developing good ore.

SUTRO TUNNEL.—Good, steady advancement continues to be made in the south lateral-branch, running toward the Julia shaft.

BULLION.—The west crosscut on tbe 2000 level is steadily advancing, the face in soft vein material. The new Cameron pump is handling the water in the main incline very easily.

COLORADO.

MINERAL CITY.—San Juan *Prospector*, Oct. 19: The vein upon the McClure lode, owned by Burrows & Larson, is one of the largest in the section, being 22 feet wide. The vein of the Napoleon extension, owned by Larson & King, is two and one-half feet wide but shows very rich ore, a mill test giving from 96 to 119 ozs. to the ton, and since that time the ore has increased in richness. The specimen in our possession shows sulphurets, gray copper and silver glance, intermingled with hut little quartz. A vein of what is called talc bas been discovered in that vicinity, carrying both gold and silver.

LEADVILLE.—A Denver *Tribune* reporter obtained from Senator Chaffee the following with regard to Leadville: There are eight or ten mines there capable of producing from $50,000 to $60,000 per day, and if the camp had railroad facilities I have no doubt that ten million dollars, or more than all the rest of the State, could be produced in the next twelve months. I really believe that the Little Pittsburg, the Little Chief, the New Discovery, the Winnemuc, the Dives, the Carboniferous aud tbe Crysalite, only one buuch of mines and lying contiguous, are really capable of producing a million a month. New discoveries are being made every day, and the area is constantly increasing. There are four smelting works and as many sampling works, and all of them are loaded with ore. Cheap transportation only is wantiug to make the California or Leadville miuing district the richest and most prosperous in the United States. Coke used in smelting now costs in Leadville from $32 to $36 per ton, aud the freight on ores by the way of Colorado Springs is $23 per ton. Still, borne down by this terrible expense, the product of the Leadville mines amounts to about $20,000 per day.

IDAHO.

GRANITE CREEK.—The quartz mines at Granite creek are hound to create an excitement, hnt not for a year yet. There are several valuable mines iu the camp apart from the Mouumental, which is all that has been represented. The Phil. Sheridan, Rattler, Bonaparte, Morning Glory are all good ledges and in an advanced state of development. It is not thought here among prospectors and miners that Portland capital will do much towards bringing the camp out. Beagle Bros. of Pendleton, have struck a ledge within the past few days which equals in richness the rock found at Yankee Fork, some of it assaying $300 in silver and $200 in gold. It is two miles from the Mouumental and advantageously situated. Cabell Bros. are shipping rock from their mine to San Francisco. Most of the rock from the district will require roasting. This will be but a small item in the cost of reduction, as there is abundance of fuel. In fact the whole face of the country is covered with timber. There are some small gold seams found, and ore from these veins is being worked by arastrar process. Two arastrars are running. Twelve ounces of bullion were cleaned up as a result of 600 pounds of Beagle Bros'. rock. Robinsonville ie an old placer mining camp 12 miles from Granite creek.

SAN DIEGO shipped, on Oct. 25th, 1,500 cases and 30 barrels of honey.

Continued from page 273.

the San Teodoro sbaft has cut tbe veins of Sen Pedro y San Diego, which have been followed for a length of about 130 meters. They have proved to be always very regular and very rich. The crosscuts have not yet reached the two other veins, which have, however, been found by small sbafts sunk from the ninth level.

Let us now recapitulate this somewhat dry monograph. We see the veins, not very regular as far as the sixth level, take a simplicity greater and greater as we descend. The two veins San Francisco and San Nicholas, first distinctly separate, approach gradually until they nearly blend in the ninth level. The southern vein of San Pedro y San Diego, seems also to approach the other united pair, and there is reason to fear that in the future, it is true still distant, the three branches will come to he united in a single one whose exploitation would be very difficult.

Another observation. The length of tho crosscut, which starting from San Aquilino, at the western extremity of the deposit, diminished from level to level.

It is in short:

	Meters.
At the 5th level	100
At the 6th level	80
At the 7th level	60
At the 8th level	25
At the 9th level	0

If, on the other hand, we make through the sbaft San Miguel, to the east of the deposit, a section perpendicular to the veins, we see the latter cut the section, at distences constently decreasing:

	Meters.
At the 5th level	35
At tbe 6th level	10
At the 7th level	10
At the 8th level	5
At the 9th level	0

The three veins of Almaden present, therefore, the form of tbree columns of ore, nearly parallel to each other, situated in a plane essentially vertical, inclined in these planes about 10° from the vertical and enlerging from the top to the bottom in a nearly continuous manner. The width at the same time increases as the deptb.

It now remains, in order to be able to arrive at an exact idea of the future of the mines, to examine the distribution in the vein of the rich parts. Custom has led the miners of Almaden to divide tbe ore into rich ore, medium ore, and poor ore. Witbout makiug these distinctions absolute, and being formed only upon the aspect of the ore, we can say that they call poor ore that which conteins from 1% to 7% or 8% of mercury; medium that which contains from 8% to 18% or 20%; and, finally, rich ore, that which contains more than 20%, reaching as high sometimes as 80% to 85%.

The plan of the fifth level, where the exploitation has been for a long time finished, shows nothing in regard to the richness;* that of the sixth level shows where poor ore was found with some massive bodiee of medium ore at the extremity of the San Francisco and San Nicholas. At the seventh level the rich ore appears. It predominates at the eighth in the whole vein of the San Pedro y San Diego; at this level the rich and medium ore is ahout as abundant as the poor ore in the Sen Francisco and San Nicholas.

The ninth level furniebee nearly exclnsively rich ore in the San Pedro y San Diego; also in the greater part of the San Nicholas. The San Francisco givee everywhere medium ore only. Finally the part known as the San Pedro y San Diego, at the 10th level, is richer than anything found beretofore. The ore formed, as I have said, by a white impregnated sendstone, presents a magnificent red vermilion color of a perfect uniformity.

In the same time that the richness augments in depth, it increases at each level from east to west; the veins are generally cut abruptly at the west, and become gradually poorer to the east aud end by passing insensibly into a barren quartzite.

We see, therefore, that in regard to the richness as well as in width and in length, the veins of Almaden increase more and more in measure as we descend from the snrface.

*We bad to renounce the reproduction of the indicated division in the plans we have given. The small scale adopted would not bave enabled us to make it clear.

[To be Continued.]

BULLION SHIPMENTS.—Ontario, Oct. 18th, $5,443 71; 21st, $3,009.59; 22d, $2,811.03; 23d, $5,818.52. Germania, Oct. 18th, $4,500; Silver Reef, Oct. $5,844.49; 22d, $2,902 18; 24th, $5,067.65; Butte, Oct. 21st, $13,899.17; Extra, Oct. 26th, $4,740; Indian Queen, Oct. 21st, $3.043.55; Grand Prize, Oct. 21st, $1,-110.39; Jefferson, Oct. 21st, $3,225.48; 25th, $1,878.26; Standard, Oct. 22d, $17,117.77; Northern Belle, Oct. 21st, $3,138.64; 23d, $3,254.12; 26th, $4,060.03; Hillside, Oct. 24th, $5,800; 28th, $5,802.50; Raymond & Ely, Oct. 16th, $2,534.66; 26th, $2,504.12; Bodie, Oct. 22d, $11,005.88; Navajo, Oct. 28th, $7,400; Manhattan, Oct. 26th, $12,000; Christy, Oct. 28th, $5,534; Belmont, Oct. 23d, $11,354; Oriental, Oct. 28th, $2;484.25; Tyho Con. Oct. 23d, $3,672.33; 25th, $3,704.81; Independence, Oct. 19th, $16,500.

IT is hinted that Secretary Sherman will recommend a limitation of the coinage of silver dollars, or increase the amonnt of silver in them so that they will be equal in value to gold.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING OCTOBER 15TH, 1878.

EXCAVATING MACHINES—James T. Dongine, S. F.
DOOR KNOB ATTACHMENTS—Job F. Peacock, Reno, Nev.
STEAM CYLINDER LUBRICATORS—Nicholas Selbert, S. F.
HORSE-POWERS—Chas. H. Baker, S. F.
VEHICLE SPRINGS—Horace R. Huie, Livermore, Cal.
SPRING BEDS—Ambrose J. Lattin, S. F.
PEACH PEARERS—Wm. S. Plummer, East Portland, Ogn.
PLOWS—Christian Myers, Napa, Cal.
CIGARS AND SMOKING AND CHEWING TOBACCO—Trademark—Engelbrecbt, Fox & Co., S. F. (2.)

——Tbs patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

DOOR KNOB.—J. F. Peacock, Reno, Nev.—Dated October 15th, 1878. This improvement in door knobs consists in forming a hollow in the knob in the form of an eccentric or cam, with an enlargement on its inner end; into which hollow is inserted an eccentric or cam-shaped shank, having its head enlarged in a screw shape. On inserting this sbank into the correspondingly shaped recess, and turning it half round, the screw-shaped beed turns into the enlargement in the inner end of the recess, and the whole outer surface of the shank is brought forcibly in coutact with the similarly cam-shaped inner surface of the recess, so as to keep the shank in position; hot metal being also poured by appropriate means into the interstices in the recess, and assisting in holding the shank in place. The shank is also received in an eccentric or cam shape, to correspond to the eccentric-shaped sheft which connects the two knobs on opposite sides of the door. By inserting this eccentric shaft in the recess in the shank, and twisting it firmly into position, a cold weld joint, as it were, is mede, bolding the shaft in place, eo that knobs fitted with the device may be pleced on any sized thicknese of doors without the use of screws in any part.

VEHICLE SPRING.—H. R. Huie, San Leandro.—Dated October 15th, 1878. The improvement consists in the formation of an endless steel epring in which an upper and lower portion extend from front to reer axles, and the uniting ende are curves of circles or nearly so. The weight of the vehicle is continually supported by the upper leaf of the spring and a brace extending from one to tbe other at the center so that the weight is equally supported by the upper and lower leaves of each of these endless side springs.

HORSE POWER.—Charles H. Baker, San Francisco.—Dated October 15th, 1878. This machine we described and illustrated in our issue of April 27th, under tbe name of the "Miners' and Builders' Horse Power." The power is a very convenient one, inasmucb as the motion of the winding drum is regulated by the operator without his having to be near the horse, or without having to stop the horse. It is more particularly intended for hoisting purposes, and is arranged so as to be very convenient for mining purposes. It is made and sold by Reynolde, Rix & Co., Nos. 18 and 20 Fremont street.

BED BOTTOM.—A. J. Lattin, S. F.—Dated Oct. 15th, 1878. This invention relates to certain improvements in the construction of slat spring beds, being especially applicable to Mr. Lattin's bed patented December 5th, 1876, and it consists in a novel mode of securing the elats by transverse bars, connected with the frame, so that the flat and coiled springs shall act more perfectly in unison, and the tension of the slat springs shall be increased. It further consists in an improved method of eecuring the coiled springs to the frame, making the bed more perfect than before.

AMALGAMATOR.—J. H. Hobart, Oakland and J. T. Best, San Francisco.—Dated Septem ber 10th, 1878. The invention relatee to cer tain improvements in that class of amalgama tors in which the ore, sand, pulp or tailings are allowed to pass through a feed pipe and become discharged and distributed within and beneath a body of mercury within a tank, and for which a patent was issued to J. H. Hobart and C. H. Stward, May 21st, 1874. It consists in a novel combination of apparatue and in the employment of certain streams of water which are discharged into the apparatus at different points so as to loosen up the sand and prevent ite becoming hard and caked, and choking up the appa

ratns. It also consists in iotroducing a body of saud into a distrihutiug tank with an excess of water, which excess of water is drained off ioto storage tanks, while an excess of sand is drawn from the tank and passed through the mercury chamber and over the riffles, and the excess of water is employed as before described to loosen up and prevent the sand from choking or becoming massed. With this invention large quantities of sand may he treated at the same time. The auriferious black sands of the ocean beaches of California and Oregon are, from their great specific gravity, apt to pack in places so as to clog auy apparatus for treating them, and this has been the principal cause of failure in the employment of machines for separating the gold, in addition to the extreme fineness of the gold; hut in this machine the inventors have provided supplemented streams of water at all points where packing is liable to occur, so as to prevent it. By the methods employed the sands are passed through the mass of mercury so that no light, floating particles of gold can escape the mercnry and a very thorough amalgamation is effected, while, at the samc time, no loss of mercury occurs by their being carried up and out by the mechanical eutanglement with the mass of heavy sand, which is always ready to separate from the water aud settle, packing very solidly when left quiet for a moment. This machiue is in practical operation on the beach sands.

Oil Cook Stove Lamps.—Henry L. Honse, S. F.—Dated Sept. 24th, 1878. This invention relates to improvements in that class of cook stoves and lamps which are intended to employ oil as a fuel, the improvements being based ou a patent granted to the same inventor March 5th, 1878. The present improvements consist first in a novel construction of the oil reservoir, by which it is possible to separate the great bulk of oil from that which is being used hy the wicks and to feed it to the wicks or thin sheets hy gravitation, while at the same time hy the action of a peculiar downwardly moving current of air caused hy the draft which it afterwards supplies this sheet of oil is kept constantly cool. A wick receiver is made in the bottom of the reservoir below the wick tohes which rest upon the hottom, and the oil is fed into these sunken spaces at each end so as to supply the wicks. The inventiou further consists in the application of an extension hot plate and removahle hot shelves around the base of the heater or stove proper, so that any waste or radiant heat is utilized at this point as well as at the top of the apparatus; and in certain other details of construction difficult to clearly describe without the aid of engravings.

News in Brief.

Edison has been seriously ill.

Nevada wool is coming into Winnemucca.

Turkish paper money is at a most alarming discouut.

A Prussian 4% loan of 60,000,000 marks has been negotiated.

Sheep herders in Montana refuse $2.50 a head for their stock.

Spain seem to be anticipating a general European war.

The insurgeot Bulgarians aim to exterminate the Turks.

An attempt has been made to assassinate the King of Spain.

Bayard Taylor has submitted to a dangerons surgical operatiou.

The volcano of Memotombo, Nicaragna, has shown signs of activity.

The Oregon Agricultural Society will lose about $12,000 hy the State fair.

Napa valley, it is estimated, will produce 1,721,000 gallons of wine this season.

The corn yield this year of 51 counties in Ohio is estimated at 63,865,000 bushels.

There are prospects of an immense crop of orauges at Old San Bernardiuo this seasou.

One hundred and fifty Cheyennes with 140 horses and mules were captured Oct. 22d.

The official estimate required for the Postal Service the uext fiscal year aggregates $36,551,900.

On the anniversary of the death of Harry Meiggs, a solemn requiem mass was suug in Lima.

A fire at Fort Whipple, near Prescott, Arizona, will cost the Goverument from $8,000 to $10,000.

The insurrection against the Turks is spreading in Bulgaria. The Eastern problem is not solved yet.

It is stated that 17½% more skilled workmen were employed at New York in Octoher, than during the same month last year.

Denmark has for mauy years supplied canued butter to South America. The same industry is to be commenced in this country.

The new freight regulations of the Union and Central Pacific railroads, will gain from four to 11 days for California importers.

French Cabinet Councils are discussing the gravity of the situation hetween England and Afghanistan, and the state of affairs in Turkey.

Thirty-seven prisoners now confined in the State Prison at San Quentin will be liberated during November, 24 being restored citizenship.

Jackson county, Oregon, wool growers, during the week ending Oct. 19th, sold about 50,000 pounds of wool at Roseburg for 10 cents per pound.

The rubher husiness of Nicaragua has greatly diminished, partly on account of the restrictions and imposts made hy the Costa Rican government.

A destructive prairie fire has traversed from 15 to 20 counties in Dakota, hetween Jim river and the Missouri river. The destruction of property is large.

The Chinese Minister sees no reason why the use of puro tea, which is cheaper thau that artificially colored, should not he used hy us more extensively.

Edwin Forrest, Mono couoty, died from the effects of the amputation of his leg, made necessary by the explosiou of a box of giant powder caps in his pocket.

Shipping pampas plumes is a new industry of Santa Barbara. One man has sold 40,000 this season to San Francisco and the East, netting him $4,000.

On the morning of Oct. 23d, a frightful hurricane swept along the region between the Atlantic and Alleghanies, damaging property to the amonnt of millions.

Fresh attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

For Printing Materials, the publishers of this pape patronize Marder, Luse & Co., Pacific Type Foundry and Printers' Supply Warehouse, 532 Clay street, San Francisco, Cal. Send them a stamp for specimen sheet, and say advertised in this paper.

Examine the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

Model Maker and Machinist.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

General Robert Allen Silver Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Pinal County, Arizona.

Notice is hereby given that at a meeting of the Board of Directors, held on the 29th day of October, 1878, an assessment of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the second day of December, A. D., 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the second day of January, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

M. C. SOUTHARD, Sec'y.

Office, No. 411½ California street, Room 11, San Francisco, California.

Keystone Quartz Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Sierra county, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the thirtieth day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Carolan, James, Trustee	59	200	100 00
Hall & Charles, Trustees	08	1248	624 00

And in accordance with law, and an order of the Board of Directors, made on the thirtieth day of August, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, No. 201 Sansome street, corner of Pine, San Francisco, California, on the twenty-eighth day of October, 1878, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, No. 201 Sansome street, corner of Pine, San Francisco, California.

Mount Jefferson Milling and Mining Co.—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1878, an assessment (No. 5)of five (5c.) cents per share was levied upon capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 318 Pine St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fifth (25th) day of November, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the seventeenth (17th) day of December, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine St., San Francisco Cal.

New Bessel Gold Mining Company.—Principal place of business, 610 Merchant street, San Francisco. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of September, 1878, an assessment of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on the 18th day of November, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. D. F. LEGAYE, Sec'y.

Office 610 Merchant street, San Francisco, Cal.

Orion Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the fifth day of September, 1878, an assessment (No. 3,) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 28 Sansome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of November, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 20th day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

P. CONKLIN, Sec'y.

Office, No. 28 Sansome Street (up stairs), San Francisco, Cal.

Summit Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5,) levied on the 16th day of September, A. D., 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
C Lehmann, Trustee	200	5	$ 25
C Lehmann, Trustee	201	5	25
C Lehmann, Trustee	202	5	25
C Lehmann, Trustee	203	5	25
C Lehmann, Trustee	2 4	5	25
T Scotland	13	6,250	312 50
F B Whiting	28	200	10 00

And in accordance with law, and an order of the Board of Directors, made on the tenth day of September, A. D., 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of said company, on Tuesday, the nineteenth day of November, A. D., 1878, at the hour of two o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

The California Fruit Growing Association.—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three ($3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the California Fruit Growing Association, held September 23d, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till Saturday, the 26th day of October, 1878, and the day of sale of delinquent stock is hereby postponed to Friday, the 22d day of November, 1878. D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco.

POSTPONEMENT.—At a meeting of the Board of Directors held on the Nineteenth day of October, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till November 30th, 1878, and the day of sale of delinquent stock is hereby postponed to December 21st, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento Street, San Francisco, Cal.

Vigorit Powder Company.—Location of principal place of business, City and County of San Francisco, California. Location of works, California City, Marin County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No 1) levied on the first day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. Shares	Amount
Louis McLaue, Trustee	30	437½	$218 75
Louis McLaue, Trustee	32	½ of 875	218 75
G W Grayson, Trustee	62	1312½	656 25
H H Shinn, Trustee	91	400	200 00
H H Shinn, Trustee	92	400	200 00
H H Shinn, Trustee	93	400	200 00
H H Shinn, Trustee	94	112½	56 25

And in accordance with law, and an order of the Board of Directors, made on the First day of August, 1878, so many shares of each parcel of stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 1, 100 California street, on Wednesday, the second day of October, 1878, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. JAS. W. BAKER, Sec'y.

Office, No. 100 California street, Room I, San Francisco, California.

POSTPONEMENT.—By an order of the Board of Directors made on the First day of October, 1878, the above sale is postponed until Monday, October 21st, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

POSTPONEMENT.—By an order of the Board of Directors made on the Eighteenth day of October, 1878, the above sale is postponed until Friday, November 1st, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

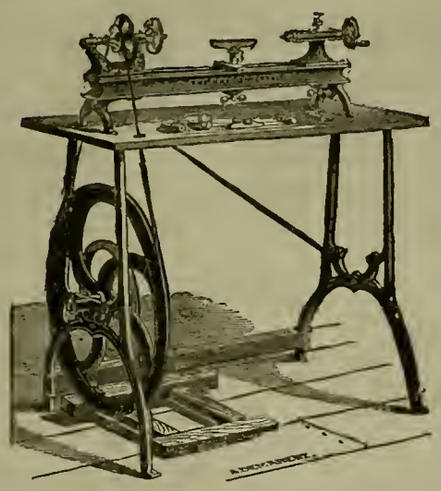
THE BRIGGS LATHE.

Combines Superior Excellence in Quality and Finish with Beauty, Strength and Completeness.



This Lathe will turn a piece of Wood or Metal 12 inches long and 6 inches in diameter.

It can be used with equal advantage for Drilling, Polishing. Sawing, etc. The length of bed is 24 inches; the spindle is made of steel, has a conical bearing, and can be tightened as it wears. The bed, head, tail-stocks and cone pulley are of cast iron and the centers of steel. The following pieces are furnished with the lathe: 2 T rests, 1 face-plate, 2 plain centers, 1 spur ce ter for wood, 1 plain drill-chuck, 1 drill-pad, and 1 center left blank to turn down as a fitting for a universal chuck. The bench weighs 81 pounds, is made of iron, with a black walnut top, and has a driving-wheel measuring 22 inches in diameter, with three grooves for changes of speed.

PRICE OF LATHE, AS ABOVE, $25.

—FOR SALE BY—

DUNHAM, CARRIGAN & CO

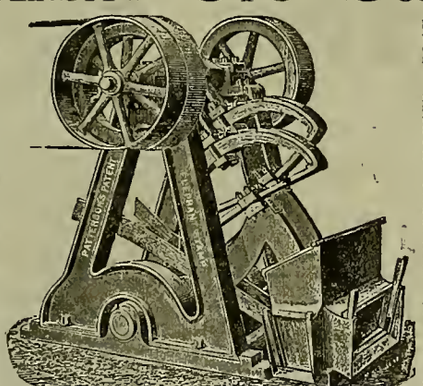
SAN FRANCISCO

Elephant Ore Stamp.

We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 14 tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-



brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Carihoo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco For particulars, apply to

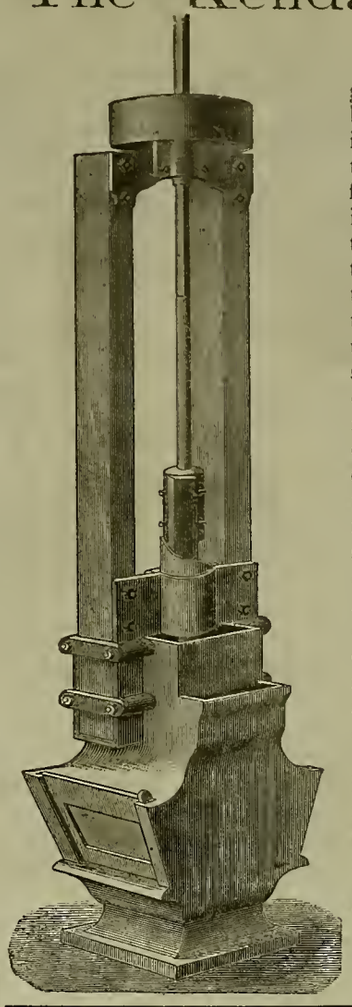
Office and Manufactory, 130 BEALE STREET, San Francisco, Cal.

The Kendall Battery.

STEPHEN KENDALL, Patentee.



This Battery embraces the only genuine improvement that has ever been made in the process of reducing ores. The frame is all secured to the mortar, so that no extra framework is required. The stamp is rotated by a horizontal pulley on the top of the frame, and raised by the cam which is set horizontally on the girt timber. The upper end of the stem is made square, and works up through the pulley When the stamp falls it crushes and grinds the ore fine by the continual rotary motion. The mortar has three discharge openings, and is adapted to either wet or dry crushing. A mill with an 800-pound stamp will crush five tons of average ore per day, shipping weight, 4,000 lbs., and requires about five horse-power. A 1 600 lb. stamp mill is in process of construction, which will give a capacity equal to any five-stamp mill. Several of them are now in successful operation in various parts of the country. For PROSPECTING PURPOSES this mill has no equal, as it can be set up and moved with such facility and operated at so small an expense. Address for further information,

REGISTER YOUR

TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

IRON PIPE AND MALLEABLE IRON FITTINGS.

ALL KINDS OF

WORK AND COMPOSITION NAILS,

AT LOWEST RATES.

N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS,

Manufactory, 17 & 19 Fremont St., S. F.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

DEWEY & CO.,
Publishers, No. 202 Sansome street, San Francisco.

VULCAN BLASTING POWDER. The strongest and most economical explosive in use.

Wherever it has been given a test, it has surpassed all other high explosives.

Works at SAN PABLO, California, and RENO, Nevada. | Office, No. 123 California Street, SAN FRANCISCO.

THE AMERICAN

All sizes, and adapted to from 3 to 500 feet head

TURBINE Water Wheels

THE BEST IN THE WORLD!

Send for our Circular and Prices.

BERRY & PLACE.
San Francisco.

PACIFIC MAIL STEAMSHIP CO.

The Company's Steamers will sail as follows, at 12 M.:

CITY OF TOKIO.....December 3d.
CITY OF PEKING.....January 4th.
For YOKOHAMA and HONGKONG.

COLIMA..... November 5th
For Panama and New York, calling at Mazatlan, San Blas, Manzanillo and Acapulco, touching at San Jose de Guatemala and La Libertad, to land passengers and mails only.

Tickets to and from Europe by any line for sale at the lowest rates—also to Havana and all West India ports.

ZEALANDIA.....November 25th, at 12 o'clock, noon, or on arrival of the English Mails, for HONOLULU, AUCKLAND and SYDNEY.
$10 additional is charged for passage in Upper Saloon.

DAKOTA.....November 9th
For Victoria, Port Townsend, Seattle, Tacoma and Olympia, connecting at Tacoma with Northern Pacific Railroad for Portland, Oregon.

Tickets must be purchased before 11 A. M. on day of sailing, at Wharf office.

For freight or passage apply at the office corner First and Brannan streets.

Artesian Wells.—No. 5.

Cost of Outfit.

The cost of the tools may bo heat determined by sending for the catalogue of somo manufacturer. In a catalogue before us, the prices are as follows:

Pod augers, varying in size from 4-inch to 11-inch, vary in price from $16 to $38. Cast steel twist augers, sizes 2, 2½, 3, etc., up to 6-inch, cost respectivcly $9, $11, $13, $14, $16, $18, $20, $22 and $24. A galvanized sand pump, 4½-inch in diamcter, costs $19; 5½-inch, $21; 6½-inch, $23; 7½-inch, $27; 8½-inch, $33; 9½-inch, $37. The screw cnupling, witb straps for fastening them to woodeu rods, cost $12 a pair; without straps, $6. Reamers cost $10 or $12; shoes, ahout $5; wrenches, $1.50; tbe block and straps for forcing the pipes, $11; an iron ring with chains as described above would cost more. Steel rings for the lower end of the pipe, as above, cost 75 cents per foot. Windlass and cranks, with barrel, $15. Lever for turning iron rods, $13; to turn square poles, $3; block and sheave, $5. Cast-steel rock drills, of the following sizes, 2-inch, 2½, 3, 4, 5, 6, 7, 7½ and 8, cost respectively $8, $10, $12, $13, $15. $16, $20, $22, $23 This is the prics list of only one house in San Francisco.

Artesian pipe is mads in the following sizes:

Double black sheet iron: 6, 7, 8 and 11 inch, costing respectively, 58 cents, 62 cents, 70 cents, and $1.22 per joint of two feet.

Galvanized, single, with collars: 6, 7, 8, 11, 12 aud 13 inches; cost: $1.38, $1.57, $1.60, $2.-50, $3.15 aud $3.45 per joint of two feet.

From these pricc lists the cost of the outfit for a well of given diameter and depth can be approximately calculated.

A complete ontbit of tools for boring wells of any of the ordinary sizes can be ohtained for from $400 to $600. It will certainly pay farmers to club together, buy complete apparatus and use it by turns.

A Philadelphia hnuse is introducing well-horing apparatus nn this coast. It is interesting to look over their catalogue.

In the catalogue referred to, under the head of "horing rig for earth, soft rock and loose stones," the following articles are mentioned: One auger (any size under 20 inches); six coup-lings, cnough for 70-foot well, witb improved safety pins; one set of derrick trimmings; one pair boring wrenches, 6 feet long, with 1¼-inch gas-pips handles, made light and strong, to turn the auger hy hand-power; 70 feet, 1⅜-inch square iron shafting, with couplings fitted and attached; four wood fenders or wheels, to attach to each bar of shafting to keep the auger perpendicular and in the center of the well; one 7-inch wood drum; reamers, 30 or 48 inches. All this costs $141. There are various extras catalogued; also a complete machine for horing to greater depths.

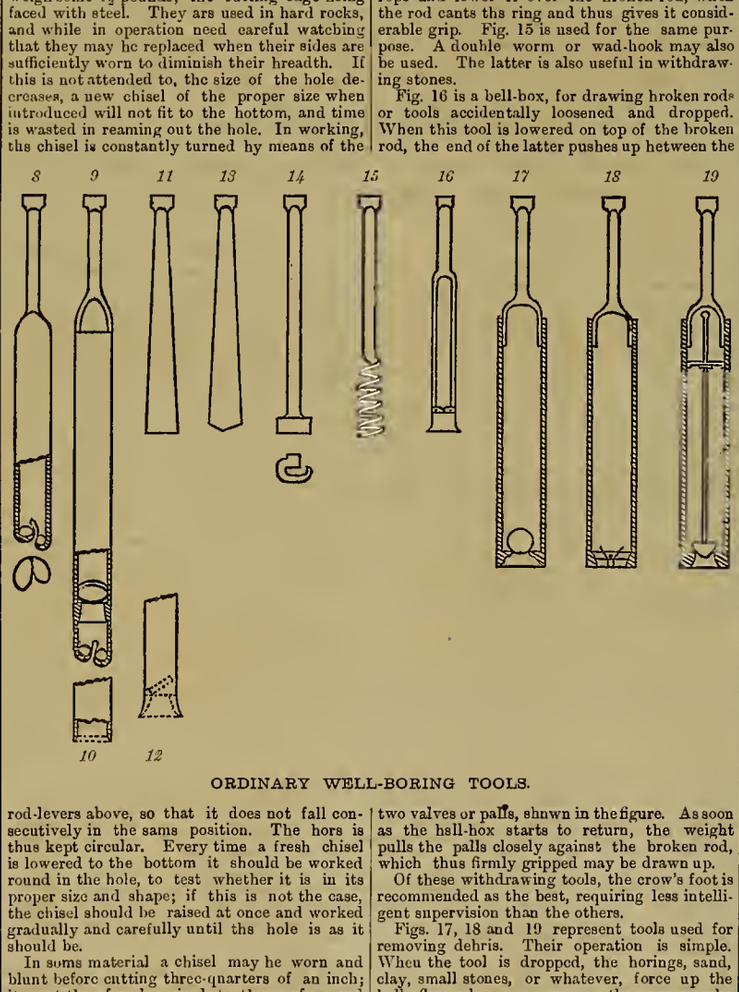
We are indebted for information to Ellis & Lennon, 53 Beale street, Francis Smith & Co., 130 Beale street, San Francisco. and to Charles D. Pierce, 4,206 Elm Avenue, Philadelphia, Pa.

Description of Tools.

The tools mentioned in the last article are comparatively modern. Well-boring as it was introduced into Europe, perhaps from China, was accomplished hy means of a drill attached to the end of a rope, for making the hole, and buckets or shell-pumps for removing the debris. This method is seldom used now, the ropes being superseded by rods, and the drills, where possible, by augers.

Figs. 8 to 19 will convey some idea of the construction and mode of operation of some of the tools used. They, as well as the following descriptions, are mostly taken from Spon's "Practice of Sinking and Boring Wells." Fig. 8 is the common earth auger, three feet long, the lower two-thirds being cylindrical. The bottom is partially closed by the lips, and there is an opening a little way up one side for the admission of soft or bruised material. Augers are only used for soft rock, clay and sand; and their shape is varied to suit the nature of the strata met with, being open and cylindrical for clays having a certain degree of cohesion; conical, and sometimes closed, in quicksands. Augers are sometimes made as long as 10 feet. The shell is made from 3 to 3½ feet long, of nearly the same shape as the common auger, sometimes closed to the hottom, Figs. 10 and 12—when they are sand-pumps rather than augers—or with a nose, Fig. 9; in sither case there is a clack or valve insido to retain horings of a soft nature, or prevent them from being washed out in a wet hole. The augers are frequently if not generally semi-cylindrical only. Stiff, putty-like material will mold itself into such augers and may he drawn to the surface without the aid of a valve, or of any special tool fnr recovering the horings.

Figs. 11 and 13 are chisels, the former flat, the latter V-shaped. These chisels are made from wrought iron, and when small are usually 18 inches long, 2½ inches extreme breadth, and weigh some 4½ pounds; the cutting edge heing faced with steel. They ars used in hard rocks, and while in operation need careful watching that they may he replaced when their sides are sufficiently worn to diminish their hreadth. If this is not attended to, the size of the hole decreases, a new chisel of the proper size when introduced will not fit to the hottom, and time is wasted in reaming out the hole. In working, the chisel is constantly turned hy means of the rod-levers above, so that it does not fall consecutively in the sams position. The hors is thus kept circular. Every time a fresh chisel is lowered to the bottom it should be worked round in the hole, to test whether it is in its proper size and shape; if this is not the case, the chisel should be raised at once and worked gradually and carefully until ths hole is as it should be.



ORDINARY WELL-BORING TOOLS.

In soms material a chisel may he worn and blunt before cutting three-quarters of an inch; it must therefore be raised to the surface and examined frequently. In other material ths wear may not be so great.

For tempering boring chisels Spon gives the following sets of directions: 1. Heat the chisel to a blood-red heat, and thsn hammer it until nearly cold; again, heat it to a blood red and quench as quickly as possible in 3 gallons of water in which is dissolved 2 ounces of oil of vitriol, 2 ounces of soda and one-half ounce of saltpeter, or 2 ounces of sal ammoniac, 2 ounces of spirit of niter, 1 ounce of oil of vitriol, the chisel to remain in the liquor until it is cold.

2. To 3 gallons of water add 3 ounces of spirit of niter, 3 ouuces of spirits of hartshorn, 3 ounces of white vitriol, 3 ounces sal ammouiac, 3 ounces alum, 6 ounces of salt, with a double handful of hoof parings, the chisel to he heated to a dark cherry red.

Drills are used of other shapes than tbose in the figurss. Ths cutting edgs nf some is shaped like a T; of others, like a Z; of still others, like an S.

Figs. 14, 15 and 16 prssent soms of the least complex "accident tools." Fig. 14 is a "crow's foot." It is used when the boring rods have hroken in the hors-hole, for the purposs of extracting that portion remaining in the hole. It is of the same length, and, at the foot, of ths same hreadth, as the chissls. When the rods have hroken, the part above the fracture is drawn out of the hore-hole and the crow's foot screwed on in place of the broken piece; when this is lowered dnwn upon the broken rod, hy careful twisting the tos is caussd to grip the broken piece with snfficient force to allow the portion below the fracture to be drawn np. A rough expedient is to fasten a metal ring to a rope and lower it over the broken rod, when the rod cants ths ring and thus gives it considerable grip. Fig. 15 is used for the same purpose. A double worm or wad-hook may also be used. The latter is also useful in withdrawing stones.

Fig. 16 is a bell-box, for drawing hroken rods or tools accidentally loosened and dropped. When this tool is lowered on top of the broken rod, the end of the latter pushes up hetween the two valves or palls, shnwn in the figure. As soon as the hsll-hox starts to return, the weight pulls the palls closely against the broken rod, which thus firmly gripped may be drawn up.

Of these withdrawing tools, the crow's foot is recommended as the best, requiring less intelligent supervision than the others.

Figs. 17, 18 and 19 represent tools used for removing debris. Their operation is simple. When the tool is dropped, the horings, sand, clay, small stones, or whatever, force up the hall, flap-valves, or cone, as the case may be (see Figs.) and enter the shell of the tool. But having once entered they cannot return, thsir own weight helping to keep down the valves. Thus confined, the horings are drawn to the surface.

We call attention to correspondence in another column on "Artesian Wells in the San Joaquin Valley."

Two gunhoats are ahout to sail from Buenos Ayers for Patagonia, to determine proper sites for erection of lighthousss. Thers is a suspicion in Chile that this is not the true object of the cruise.

On the evening of Oct. 6th, an earthquake destroyed several villages of Salvador. At time of latest advices, an eruption of the volcano Santa Ana was feared.

A Circle of Agricultural and Mining Counties.

Ths puhlishers of the Marysville *Appeal* bave issued a directory for Yuha, Sutter, Colnsa, Butts, Tehama, Placer and Nevada counties. They have "diverged from the heaten paths of directories, and encompassed a new and original plan." The object of the publishers has heen "not only to give the names and addresses of husiness and professional residents, hut also to include every hona fide resident land owner, with numher nf acres to which title has been acquired." A hrief descriptive sketch of each place mentioned is given. The names are arranged alphahetically undsr their respective postoffice addresses.

The result of the publishsrs labors is a book of great interest, not only to husiness nien as the name "Directory" might lead one at first to suppose, hut to all who ars inquiring into the resources of a new and atractivs country. Ths sketches of the counties themselves and of the cities, towns and villages dotting them, force upon the reader a realization of the resonrces and industries of this part of northern California. Nearly every cluster of houses that has merited description further than its location and postoffice address, is recorded as the center of vast grain fields, of heautiful orchards, of a valuable timber section, or the depot of supplies for great placer, or quartz-ledge mining camps. In many respects the counties treated nf are representative of northern California; in some respects, of the whole Stats. Thers is Yuba hoasting of gold hearing gravel-heds and quartz-leads and valuahle for its forests of pine; luxuriating in orchards of peaches, oranges, grapes and almonds, aud in never failing-crops of the small grains. Sutter, with its historical name, occupying a fertile section in the center of the Sacramento valley, and sending grain and fruit to market. Colusa, noted for its grazing and cattle-raising indnstries, for its farm of 57,-000 acres, "perhaps the greatest wheat farm owned hy a single individual upon the continsnt," yet having room in its mountains for quicksilver, copper, sulphur and petroleum. Butte, home of the placer miner, yet with fertile and productive valleys. Tehama, once a prosperous mining county, hut with the attention nf its people now turned to cattle-raising and wnol-growing and lumhering. Placsr, with gold in placers and in ladgss, with granite and coal and pottery clay; with prospective vineyards and orchards. Nevada, the mining county, *par excellence*, with millions of home capital already invssted, and foreign capital "on the way;" its foothills "peculiarly adapted to the growth of fruits and cersals."

The hook, hesides serving all the purposes nf any directory, will no douht prove of great henefit to the counties favored, by attracting the attention of outsiders to them. On this account, as wsll as on account of the gsueral convenience of the work, we suggest to the publishers that they continne their lahors intn other counties.

Mining and Water Rights.—The Committee of Mining in the Constitutional Convention consists of Messrs. Mark R. C. Pulliam, W. J. Tinnin, James E. Hale, Jas. H. Keys, R. M. Lampson, L. F. Jones, Jno. F. McNutt, Samuel B. Burt, J. M. Strong, Patrick T. Dawling and Jno. McCoy. On water and water rights: W. J. Tinnin, Mark R. C. Pulliam, James H. Keys, Josiah Boucher, Jos. C. Brown, J. A. Filcher, Thomas McConnell, Henry W. Smith, David Lewis, Rush McComas, John Walker, Thos. H. Estey, G. W. Hunter, E. P. Soule, Rufus Shocmaker, J. M. Strong. These gentlemen may be addressed at Sacramento.

Jute on Fire.—In a bale of jute butts thrown into a cutter in the paper mill of Wilkinson Brothers & Co., in Birmingham, Nov. 3d, was a piece of iron, which, coming in contact with the knives, ignited the jute. The resulting fire hurned up $200,000 worth of property, and threw 100 persons out of employment.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Artesian Wells in San Joaquin Valley.

EDITORS PRESS:—You have requested me to send such items as can he gathered in tbis part of the State on artesian wells, a topic of iuterest and profit now throughout California. Your very valuahle articles lately on such wells in San Francisco have been quite a surprise to many of your readers. Few outside of the city knew tbat a single flowing well had been obtained within its limits, and now, since they learn through your useful sketches and illustrations, that many fine flowing wells already exist there at less depths than 200 feet, while others hring pure, soft water near the surface, thousande in the country who like to see justice done, are rejoicing with your citizens that a means has at last heen found to make a grasping water monopoly more reasonable in its demands. In this, as in many other instances, dame Nature has beeu kinder to the people of California than many of her own citizens have been.

I regret to report that while many large flowing wells have already been obtained iu Merced county, along the Merced and San Joaquin rivers, Bear creek, the Mariposa and Cbowchilla, at depths usually less than 300 feet. as already mentioned in your columns, hut little bas heen done iu this direction in Tulare and Fresno counties.

The fiue flowing well, eight inches in diameter, hored lately by the railroad company on its lands near Tipton, about 300 feet deep and with a flow of some 80,000 gallons every 24 hours, and three with a small flow of water near Lemoore, are the only ones I can hear of in all this region. I may mentiou in tbis connection that the first flowing well between the Merced and Tuolumne rivers has lately heen hored near Turlock, my old home, at a point hetween there aud Hill's Ferry, a few miles east of the Joaquin and north of the Merced. I bave not been able, as yet, to procure farther facts than that a fine flow of good water was obtained there at a depth hetween 300 and 400 feet.

Here I shall give your readers such items as I bave secured about

Three Flowing Wells on One Ranch

Near Lemoore—the only ones in all this Mussel Slough country. They have heen bored during the last four years ou the fine stock ranch of John R. Heinlen, about a mile west of towu.

One near his dwelling, used for household purposes, is 150 feet deep, and commenced flowing at about 85 feet, with little or no increase in flow at greater depths. A second one, near his slaughter house aud railroad switch, is 200 feet deep and began flowing at ahout 90 feet. The third in his pasture ahout a quarter of a mile northwest of the first, is 400 feet deep and hegan flowing at 150 feet. The latter is a seven-inch hore, tbe others smaller.

The water in all is soft, and pleasant drinking water, varying in temperature from 68° to 72° Fahr. The flow from each is small, hut Mr. Heinlen informs me that the amount is steadily increasing in the deeper well.

The Strata Passed Through

In the 150-feet well were as follows: 1, surface soil, 14 feet; 2, sand, 10 feet; 3, hlue clay, 60 feet; 4, gray sandstone, 6 or 8 inches. After passing the latter, a small flow was obtained. Tben they hored alternately through sand and clay, varying in thickness from 2 to 5 feet.

In the 400-feet well the horing was almost all through sand. This gave much trouhle, as the bore was constantly filling up. So much pumping had to he done that Mr. H. iuforms me there was about 2,000 feet of work done to gain the depth of 400 feet.

Wells near Hanford.

Plans are uow heing discussed for testing the depth at which artesian water can he had near Hanford. It is proposed for several neighbors to make up a purse to hore a well on the place of some one of them—not a railroad quarter. If unsuccessful, the loss will he horne in common; if successful, the owner of the land will pay the expenses. In view of what has already heen developed so far by all attempts in San Joaquin valley, it is, no doubt, safe to assume that there is

An Artesian Belt,

Extending from 5 to 10 miles or more east of lower Kern river, Tulare lake, lower King's river, Fish slough, Fresno slough and the Sau Joaquin river, say for some 300 miles along this line of drainage, where flowiug wells can be ohtained at depths varying from 100 feet or less to 400 feet, in most localities; espccially near all water-courses.

This helt may extend a short distance west of the same water line, as well as throughout Sacramento valley, within similar limits east and west of Sacramento river. As a general rule, the farther east of this belt you go, thc deeper you have to hore for flowing wells.

Certainly the many successcs thc past year in securing the hest of flowing wells will be a great stimulus to testing the matter thoroughly within the next year or two, along the entire artesian helt here indicated, as well as in our coast counties. J. W. A. WRIGHT.

Hanford, Oct. 29th, 1878.

Mariposa County Mines.

EDITORS PRESS:—Having returned from a brief visit to Mariposa county, it affords me great pleasure to report to you a few items concerning the following mines that I visited while there: The Martin, Wallen and Vanderita are mines that havo heen worked for a number of years, and they have never heen ahle to pay running expenses from tbe mines until they fell iuto the hunds of Joshua Hendy, Esq., well known to all old "California miners." Under the management of Mr. Hendy these mines have become hullion-producing, and are yielding largely and lucratively to the lucky owners.

The C. W. Thomas Mine

Was the next one that I visited, and is under the direct supervision of C. W. Thomas, a thoroughly educated miner in all its branches; and capitalists who are interested in mines would do well to pattern after his manner of working a mine if they wisb to be successful.

The Mary Harrison, Potosi, Melvina and Mahoney.

These mines are the property of Seth Cook & Co., and I consider it the best paying property in the State. This is another proof that when mines are worked by competent parties they can be made to pay; but managed hy incompetent parties, who have uo end to subserve other than their own interests, it is a safe conclusion that the mine or mines will go to destruction. No matter how rich the mine may be, or how much cash may he expended, the result will invariably he the same.

Hasloe or Funk.

This mine bas been badly managed. But it has fallen into the hands of one of our best known mining engineers, and by scientific management this will be another evidence of the richness of the great Mariposa mother lode.

Texas, Champion, Gold Hill, Indian Gulch, Last Chance, Crown Lode, Adelaide, Anderson, Crown Peck, Dead Broke, Lone Pino, Pino Blanco and McAlpin are all situated on the mineral zone or helt, which is known as the great "Mariposa Mother Lode." It is possible for any one of these mines to ho a honanza equal in extent and richness to those of our Comstock mines, and it is a certainty that within tbe territory of these locations, with a small amount of capital properly handled, would give as great if not greater results.

W. ROSE,
Mining and Mechanical Engineer.

Locating a Mining Claim.

EDITORS PRESS:—I have seen it stated several times, undouhtedly in accordance with the tenor of the law, that a prospector should do sufficient work on his "find" to determine, approximately, the course of his vein *before* making his location.

Under the old system it was only needful to place a notice at tbc point of discovery claiming so many feet on each side of such notice, or rather in each of two opposite directions therefrom, "following the course of the vein," whatever that course might provo to be, with so many feet of ground on each side of the vein according to local law.

The utmost approach to precision that was usually attempted in these notices was to say "in a northerly and southerly," or "northeasterly and southwesterly direction," meaning broadly somewhere ahout that, as indicated hy the words "following the course of the vein," which were seldom or never omitted.

But the present law requires that the coruers of the claim shall he distinctly marked on making a location, and in order to do this it is needful to know pretty correctly the exact course of the vein hefore locating, which in some cases will require considerahle work and consequently time.

Now, the question arises, who or what is to protect the prospector while he is making this preliminary investigation? In remote and little known districts there might he no difficulty, hut where, as now in Bodie, hundreds of men are on tbe hills looking for a chauce to make a location, it would never do to go fooling ahout a rich strike during sevcral weeks, or even days or hours before making a location. Others would he digging holes all round and might strike ou the same or other veins within the limits of the intended claim, so that by the time the first finder was ready to mark his corners, he would he likely to find that there was nothing left for him to take without encroaching on prior locations.

On the other hand, if the finder of a vein which is not readily traceable ou tbc surface of the ground were to make a location hastily, he would he very likely to err in the course to the extent of many degrees, and then not only might his claim cover more or less than the 1,500 feet of the vein itself that the law allows him to take, but it would also be impossible to conform to the law in regard to the width of his claim, which must be so many feet (not more than 300 nor less than 25) "on *each side of the center* of the veiu." This is only one of several defects, if defect it he, in the law regulating mining, and the muddle is heing aggravated by decisions which are directly in conflict with the law itself.

I refer particularly to a case which occurred, I think, in Arizona, where it was decided that a relocation was valid which had heen made *before* the expiration of a year from the date of first location, although the original locator was on the ground working, the ground of the decision heing that it was then too late for him to *finish* the required amount of work within the year.

This decision was absurd for two reasons. In the first place, though the law requires that $100 worth of work shall be done in each year, it does not specify any particular portion of the year in which it shall he done. If wages are $4 per day it would take one man 25 days to do the work, hut 25 men could do it in one day (making a road, for instance), 50 men in half a day, and so on, or the particular kind of work done might he worth a good deal more tban $4 a day to the man. Who then shall say what length of time is required to do a huudred dollars worth of work? Secondly, the law specifically and distinctly provides that even after the title to a claim has lapsed, that is, after the prescribed year has passed without the required work being done, if the locator goes to work before a relocation has actually heen made his right is revived and his title becomes as good as though he had not failed to fulfill the requirement of law. How then could he possibly he deprived of his claim when he had begun to do the work, not only before the expiration of the year, hut, if I remember right, before the relocation was attempted. I may he wrong as to the last point. Perhaps the relocation was pretended before he arrived on the ground to work; it is immaterial; a relocation attempted before the expiration of the term prescribed hy law, *could* not he valid, aud before a valid relocation could he made the man was at work, thereby putting a har to any such proceeding.

C. H. A.

Benton, Mono County, Oct. 19th.

Rebellious Miners.

EDITORS PRESS:—I observe, in your issue of Octoher 19th, an article hy Mr. Melville Attwood, which I read with pleasure, from the fact I was glad to see tbat some one was trying to enlighten our American gold miners on the question of gold saving, many of whom reason from the fact tbat, as tbey cannot save on an average over 30%, that, *ergo*, it must he "rebellious." Now the fact is, it is the mill man himself who is the rebellious feature of the operation. He seeks first not to comply with; and, seoondly, to override an unconquerahle law of nature, viz., gravity, and is determined that an atom of gold the size of the point of the finest camhric needle must resist the pressure of 2 to 4 inches of running water, and hecause it does not it is "rebellious" gold—rebellious, from the fact that it does not obey his wish or will. I have becn 15 years preaching the senselessness of this doctrine, and hy the issuance of 10,000 pamphlets (at my own expense). The present harbarous way of treating the precious metals will, in due time, become fully apparent. I now appreciate the fact that there is growing a greater interest on the subject of

Mineralization of Gold.

Nature has given us *gold*—simply gold—neither "rebellious" nor "rusty," though possihly in some instances dirty gold, until man goes to handle it, and which is as yielding as could he desired, when man will fully comply with Nature's simple laws, to gather it in. Of course I accept the fact of gold heing often enveloped hy, aud extensively associated with the baser metals, and which make it intractahle, without the use of fire; not hy way of "mineralizing" it, hut that the metals with which it is associated may the more cheaply, readily and thoroughly he made to yield up their treasure. And here allow me to say, that the gold thus enveloped hy the baser metals is infinitely finer than when free of them; so that gold in "sulphurets," speaking practically, requires not only skillful handling, hut great care in amalgamation.

The fact that the great wealth of our gold mines is in what I will term atomic gold, was settled in my mind long ago, and hy more than a thousand experiments, running hack for 20 years; and did the gold miners of California hut fully realize the wealth they monthly wash away hy their rough treatment of this atomic gold, they would accept the fact with joy that they had eo much more wealth within their possession. In my many experiments I have solved the problem, that the per cent. of gold to he ohtained (admitting full compliance in amalgamating with natural law), is in the per cent. of reduction of the matrix. If you reluce tbe ore to an impalpahle powder, and thus release this atomic gold, from 90% to 95% is ohtainahle; hut if you only rcduce to a moderate degree of fineness, the amount of this atomic gold wasted is beyond helief of any one who has not closely investigated. You cannot get at tbe pea, without breaking the pod; neither can you overcome the law of gravity, to amalgamate it even when released.

The atomic character of gold is finely illustrated hy specimens which can he seen at my office, room 20, Safe Deposit huilding. Gold so fine that, in distilled water, it will not all settle in 20 minutes. The Sacramento river, hy actual tests of its "muddy water," is passing down and pouring into the ocean millions piled on millions yearly of this atomic gold.

I have not time to write all I would like on this subject, but will send my pamphlet, free, to any reader of the PRESS, and will content myself with the few ideas carelessly thrown forth, hoping that our miners will embrace the following proposition, as offered hy Mr. Attwood, who says:

"In the first place, I would suggest to any mine adventurer, or superintendent, working lodes, which they think contain *rebellious gold ores*, or mineralized gold, that the hest argument they can use would be *facts*, in the shape of ten or fifteen pound samples of the veinstone, say, in pieces of onc or two inches square, reprcsenting, of course, quantity. They can forward sucb samples to this society free of expense (owing to the liberality of Wells, Fargo & Co.), and, when received, I will get a committee appointed to examine and report on them."

Our mill men have all to gain hy the information they will receive—coming as it will from the State Geological Society, which will guard well its opinions, deductions and advice—iuvestigate. ALMARIN B. PAUL.

San Francisco, Oct. 30th, 1878.

Amazon Consolidated Mining Company.

This mine, located at Devil's Gate, Lyon county, Nevada, is heing developed conjointly with the Glasgow, by a vertical shaft now sunk to a depth of 430 feet. This is a two-compartment ehaft, and well timbered througbout. Over it have been erected steam hoisting works with capacity to do the lifting and pumping to a depth of 1,500 feet. Powerful pumping gear, extensive huildiug shops, with full supply of tools, etc., have heeu provided, everything in and about tbe mine heing of a suhstantial kind, and in first-class order. The length of drifts run, nearly all timhered, amount to nearly 500 feet. The lode, of which this mine forms a section, is one of the most remarkable ever opened up in wcstern Nevada. Geologically speaking, it is the acme of perfection, of great thickness and surface exposure; it stands hetween its nearly upright walls like a piece of masonry. The linings of the walls cousist of a heavy clay selvage, often more than a foot in thickness, which, separating the vein matter from the country rock, admits of the former being easily broken down and removed, thereby greatly reducing the cost of ore extraction. These walle are not only well lined, hut tbey present, wherever uncovered, smooth, regular and unbroken faces, denoting here one of tbe best marked and well preserved fissures in nature. In the fracture and filling of this fissure powerful dynamic and magnetic agencies have been at work, and if it shall fail to he hoth persistent and fertile, nature will fail to have fully effected an obvious purpose. But this will not happen—there are ore hodies in this fracture. They may lie deep, hut they will he found somewbere below in great power. Already much ore of medium grade has heen developed in tbis mine. At the depth of 100 feet in main shaft, a cross drift has heen run easterly 54 feet to the hanging wall of the vein. From here a drift was run to foot wall, 55 feet, showiug a large amount of low-grade ore. Lateral drifts were run each way 35 feet, and a winze sunk 60 fect, the ore not showing improvement. Sinking main shaft was continued until the 200-foot level was reached. At this depth a shaft penetrated vein. From this station drifts were run each way on the vein, one north 65 feet, and one south 24 feet. The ore at this level shows great improvement, hut is hadly hroken and mixed with vein material. The walls are of smooth, blue clay and well defined. Sinking of the main shaft was then resumed, and at the depth of 300 feet, much water was encountered. From this point a cross drift was run westerly 35 feet to east or foot wall of the vein. Lateral drifts were run each way 100 feet; south drift showing ore in hunches the entire distance. The drift north toward the Glasgow ground cut a line streak of ore two feet in thickness, giving good assays aud entirely free from worthless vein material. This ore is on the line between Amazon and Glasgow mines. A winze was sunk on this vein 20 feet, and found to widen as it went down, water coming in such quantity as to impede work. Sinking main shaft was again resumed, and at a depth of near 400 feet a stream of water was found that drove the miners out of the shaft, and necessitated the putting in of the present pumping machinery. This occurred nearly two years ago, hut tho mine being then owned mostly hy men of small means, they were unable, after putting in the new machinery, to resume active operations, wherefore work for a long time was intermitted. Recently the mine has gone into other and financially ahler hands, who will uow pnsh its exploration with system and vigor.—*Pacific Coast Mining Review for 1878.*

WITH a view to promoting the development of the mining industries of Honduras, an engineer has been appointed to examine and report upon the mineralogical wealth of tbe country.

IT is said that it costs the Sierra Nevada company $20 to send a visitor down to foot of the incline.

GOLD in paying quantities has been fonnd in southern Chile.

GOLD in small quantities has been discovered on a Peunsylvania farm.

MECHANICAL PROGRESS.

Getting a Shaft in the Lathe.

J. J. Grant writes for the *American Machinist* his method of preparing a shaft for turning. Although he in the main describes the steps and precautions which good machinists usually observe, there are some points of practice which it will be worth while to read about and experiment with: As the centering of a shaft, or piece of work, is the first operation, and as all subsequent operations are dependent on the centers, it is, of course, necessary that they should be as perfect as possible. In the first place, *never* turn a piece of work, no matter how short the job, without drilling and countersinking the centers, as the lathe, or male centers, retain their accuracy for a much longer time than when work is done on them without being so so made ready.

To center a piece of work properly it should be, if a long shaft, straightened as near as possible with the eye, which may be done either with a sledge or under a screw press, then with center punch, prick as near as possible, and only deep enough to hold on the centers; it can then either be revolved and marked with chalk on the full side, and drawn with the center punch, or it may be "square centered;" which is done by having a center ground square, leaving four cutting edges.

Care should be taken to put the square center into the tail stock of the lathe, so as to present two cutting edges to the front. A "crotch" tool made in the form of a V at the end of a common lathe tool, having an opening large enough to take in the shaft, is then clamped into the tool post, and set so that the center of the V is on a level with the lathe centers.

The shaft should be revolved at a speed as fast as practicable, say from 50 to 300 per minute, according to the size. The crotch tool should be forced against the revolving shaft, and, at the same time, the square center must be gradually worked in, care being taken not to make the center too large before the shaft has become true. A little practice will enable a beginner to center a shaft true and quickly.

Never drill or ream a center too large or out of proportion with the work, as nothing looks worse to a mechanic than to see centers in a piece of work one-half its diameter.

The size of center drills for different diameters of shafts should be about as follows: ¼ in. to ½ in., inclusive, 1-32; ⅝ in. to 1 in., inclusive, 1-20; 1¼ in. to 3 in., inclusive, ¼; 3½ in. and above, 5-32. The largest or outside diameter of the countersink should be about three times the diameter of the drills, but these proportions must, of course, be inversed if the shaft is to run on centers, and not in journal boxes.

Having now centered the shaft, the next operation is to straighten it. There are various appliances for this purpose, but the best is a screw press, made to traverse the bed of the lathe, and in the best make having wedge blocks with a V on the top that can be raised, and also moved close together, or far apart, as the crook in the shaft is short or long.

Now, while the shaft is revolving, mark the full side with a piece of chalk every three or four inches for the full length, as by so doing you get the proper place to begin. Sometimes it should be bent more than is necessary to bring the exact spot true, as when the full side or crooks are on opposite sides, when by bending the other crooks it will bring it back.

It is always necessary to loosen the centers when using the press; the wedges should only be brought to bear and not forced under the shaft too tight. To become an expert at this part of the work requires long practice, and can only be attained by closely noticing the effect of each blow or strain of the sledge or press upon each part of the shaft. I have seen a shaft, when pronounced finished by a good hand, run as true as a turned shaft.

When we have the shaft properly straightened, it must be squared true with a side tool, and the centers re-reamed with the square center, care being taken to have the center *exactly* 60° angle. Drill the centers with the proper sized drill only about one-eighth inch deep, and the shaft is ready for the next operation, which is turning.

Driving Nails with a Gun.—Respecting an implement on view at the Wellington Industrial exhibition, the New Zealand *Times* says: "One of the most simple, and at the same time most ingenious implements on view at the exhibition is an invention of a young man in this city, a Mr. F. Falkner. It is called a 'nail gun,' and is used for nailing down flooring boards. We have seen the implement in use, and as far as we are able to judge it is quicker in its work and insures greater cleanliness than hand nailing could do. The apparatus is not unlike a gun in shape, and is about the same length. It is kept in position with the foot and knee, and the nail to be placed (point down) in an aperture at the top of the concern. It slides down to the bottom and then the operator draws up a rod, and by one downward stroke of this the nail is cleanly driven into the boards beneath. A practiced hand, by this simple contrivance, could do the work of half a dozen men. We believe that Mr. Falkner is now improving upon his invention, and is making a 'nail gun' which will be self-feeding. We have no doubt that when the implement comes to be generally known it will be brought into general use."

The English Steel Ship.

It seems that the steel ship built by the British government is a success, and the London *Times* says that "whatever doubts may have been entertained with respect to the speed performances of the *Iris*, steel dispatch vessel, were conclusively set at rest by the long and varied trial to which she was subjected on the measured mile in Stokes bay. She was proved to be not only the quickest ship in the navy, but the quickest ship afloat, having surpassed the highest speed realized by the *Lightning*, torpedo vessel, and even outstripped the most sanguine expectations of Mr. Barnaby, her designer." We read that the *Iris* was in every respect an essentially experimental craft. There was nothing resembling her in the service with reference to the proportion of midship section to length, the extreme fineness of her entrance and run, and the ratio of her enormous horse power to displacement; and as a result there were only very imperfect data to guide the Constructive Department as to her probable performances from the actual performances of previously existing ships. The ship was trimmed by ballast and coal to 15 feet 8 inches forward and 20 feet 6 inches aft, which was near about her load line; and the new experimental four-bladed screws were 16 feet 3 inches in diameter, and had a pitch of 20 feet. The blades were smoothed to prevent friction, and conical caps had been tapped into the bosses over the nuts which secure the screws to the shafts for the purpose of preventing the wave which has been found to follow a bluff ending, whereby the resistance against which the ship has to contend in passing through the water is augmented. The result of the trial was in every respect more than satisfactory. Four full-power runs were made on the mile with the following surprising results: Steam at engines, 62 lbs.; vacuum, 27 inches; revolutions, 96 starboard and 98 port; horse power, 7,734.85; speed of vessel, 18.572 knots. The engines thus developed fully 700 horses more than the contract, while the ship realized two knots in excess of the speed obtained from the larger screws, and fully a knot more than the Constructive Department anticipated to get out of her.

A Drill for Square Holes.

Certainly a drill to bore square holes is an interesting machine. The *Iron Age* finds that such a device was exhibited at Paris. The inventor is named Hall and he drills a square hole in metals or other substances with a rotary motion in one operation. For this purpose he employs a three-sided drill, either flat or fluted which, in cross-section, is of the form of an equilateral triangle. He makes the bottom or cutting edges of the drill perfectly flat, and three in number, each cutting edge extending from one of the outer corners to the center of the triangle. A special drill chuck, forming part of the invention, is provided, and attached to the lower end of the drilling spindle. The chuck is constructed in such a manner as to admit of the drill traveling automatically in a horizontal plane some little distance. This is rendered necessary by the peculiar movement of the cutting edges of the drill, which does not operate or rotate on a fixed central point, but diverges somewhat in proportion to the size of the hole. Near to the lower end or cutting edges of the drill is fixed rigidly a metal guide bar or plate. The guide bar is provided with a square hole similar to the hole it is required to drill, the dimensions of the three sides of the drill being such that the distance from the base to the apex of the triangle, which such three sides form, is the same as of the sides of the square hole it is required to drill. The triangular drill for drilling dead square holes may also be used without the self-adjusting drill chuck in any ordinary chuck, when the substance operated upon is not very heavy nor stationary; then, instead of the lateral movement of the drill, such lateral movement will be communicated by the drill to the substance operated upon.

Revival.—The *National Car Builder* for October says: There are unmistakable indications from various quarters of a gratifying revival in the business of car building. The activity is not sudden or spasmodic, but a gradual and healthy recovery from the extreme depression which followed the great collapse of five years ago. The regular manufacturers and many of the principal road shops are quite busy with new work—mostly freight cars. Considering how the great leading lines, as well as those of secondary importance, have been compelled to starve this class of car stock for the past two years, it is not surprising that extensive renewals have become necessary in order to meet the demands of an increasing traffic.

Cannon Lifters.—For disembarking very heavy guns at foreign stations, it is proposed by English engineers to employ lofty sheers, and the work will devolve upon the force of Royal Artillery in the nearest garrison. *Iron* says: A pair of sheer legs, 80 feet long and each 2 feet 6 inches in diameter, was purchased and brought to the Royal Arsenal, Woolwich, during the preparations of last spring, and it was intended to employ them in the first instance for mounting the guns at Languard Fort, opposite Harwich, but a large party of artillerymen have this week erected them on the wharf at the Royal Arsenal, Woolwich.

SCIENTIFIC PROGRESS.

Determination of Sulphur in Coke.

The sulphur in coke, says *Iron*, is usually determined, either by boiling with nitric acid and potassic nitrate, or by fusing with potassic nitrate, sodic carbonate and salt. The fact that boiling nitric acid and aqua regia and potassic chlorate gave results considerably below those obtained by fusion, has induced Mr. W. A. Bradbury to make numerous experiments, from which he concludes that a large amount of sulphur in coal may exist in organic combination. The sulphur in coke is generally supposed to exist as sulphide of iron; but he thinks that the sulphur can exist in another state of combination. He observes that only small quantities of sulphuretted hydrogen are evolved on treating with dilute hydrochloric acid; also that all the iron in the coke is dissolved out by dilute acid, thus proving the absence of both protosulphide and bisulphide of iron. Only a trace of sulphur, as sulphate, exists in them. It would, therefore, appear to be in organic combination. The amount dissolved out by acids is considerably lower than that obtained by fusion. That the same result is not always obtained when using the acid process, is shown by Crossley (Crookes' "Select Methods in Analysis"), who draws attention to the fact that boiling nitric acid gives results considerably below those obtained by fusion. He came to the conclusion that it was not that some of the sulphur was not oxidized, but that it was lost by volatilization on evaporating to dryness. By adding a little niter to the solution before evaporating to dryness to fix the sulphuric acid formed, he obtained results as accurate as those obtained by fusion. But Mr. Bradbury holds that Crossley's conclusion does not hold for all cokes, as by using different weights of coke and different amounts of acid, the same result can be obtained for the same coke, although the result is far below its real value. On fusing the residual coke after treating with acid, sulphur enough to make the amount equal to that obtained by fusion is obtained, thus showing that the acid has not oxidized all the sulphur existing in coke.

Anthropology, Archæology and Ethnology.—These fields of investigation interest many of our readers, and to them we announce that the *American Antiquarian*, a new magazine devoted to anthropology, archæology and ethnology, proposes to open its pages for contributions on the following topics: 1. The traditions of the flood, creation, tree and serpent, first ancestor, migrations, culture-hero, etc., extant among the uncivilized races of the world. 2. The aboriginal languages of America, their structure, affinities and peculiarities. 3. Aboriginal customs, burials, marriages, feasts and initiatory rites. 4. Tribal organization, the totem system, tribal signs and names, the system of consanguinity, the comparison to the patriarchal system. 5. Aboriginal Religions—the belief in Divinity, the system of religion, whether shamanism, animism, sabæanism, or the worship of the heavenly bodies, the worship of fire, ancestor-worship, idolatry, and the peculiarities of each. 6. The evidences of preceding population, earthworks, shell heaps, mines and inscriptions. 7. Archæological relics, symbols, ornaments—especially the symbols of the cross, serpent, tree, phallic symbol, and hieroglyphics, styles of architecture, or other tokens of pre-historic people. The editor of the *Antiquarian* is Rev. S. D. Peet, of Unionville, Ohio. We presume much valuable information on these points could be collected on this coast.

Volatilization of Arsenious Acid.—In chemical treatises there appear contradictory statements concerning the temperature at which arsenious acid gives off vapor. According to Thenard, volatilization begins at a cherry-red heat; according to Berzelius, if heated in open vessels, it softens and begins to sublime at incipient redness. In the *Encyclopedie Chimique* it is said to soften and sublime under an ordinary pressure at 200° C. Wurtz gives the same degree, but without mentioning the softening. According to Watts it begins to sublime at 218° C., and according to Wormley at 190° C. The author finds that it volatilizes at much lower temperatures, especially when assisted by the evaporation of a liquid in which it is contained. Under these circumstances it is more or less volatile at temperatures ranging from 100° to 150°.

A New Electric Battery.—A new battery is described by Ponci, an Italian electrician, which is said to be novel and of great simplicity. It consists of a glass jar and a porous vessel, the latter filled with a solution of ferrous chloride, and having an iron plate as a pole. The outer solution is of ferric chloride, with a carbon plate as a pole. Both solutions should be made up to a strength of 35° Baume. The electro-motive force is said to be nine-tenths of a Daniell cell.

Ancient Records.—Mr. Magnusson has returned from Sweden and Finland, says the *Athenæum*, with a harvest of Runic Calendars. He has brought back photographs of 265 Runic staves, and books on wood and bone and horn, abounding in a variety of types as to the form of the runes and the mark-days' emblems, and no less various as to the terms by which the year commences.

Persistence of Images on the Retina.—It will be remembered, says *Iron*, that about the beginning of last year, Dr. Boll threw some new light on the structure of the retina by the discovery of a substance of purple color in the last retinal layer, in which a portion of the "rods" is engaged. It had escaped notice before, because of its very rapid disappearance on the action of light. Dr. Boll felt himself warranted in saying that the formation of images on the retina was a veritable photography. Subsequently Dr. Kuhne discovered the organ by which this purple is incessantly reproduced—viz., the mosaic layer, or hexagonal epithelium of the choroid, which, therefore, it has been proposed to call the retinal epithelium. M. Giraud Teulon in a recent report, calls attention to some modifications in theory required by the unlooked-for physiological function referred to. Thus as regards the persistence of positive images (*i. e.*, the continuance of the sensation after the impression that produced it), the simple fact of chemical decoloration of the retinal purple by the light, involving a certain time for its reconstitution, by the secreting action of the mosaic layer, gives a sufficient account of the phenomenon. Then, as to accidental negative images and their successive phases of coloration, the photo-chemical theory replaces Young's perfectly arbitrary explanation, based on three supposed different kinds of fibers, by a similar one, which is this: A given monochromatic light chemically alters, in a constant and uniform way, the retinal purple which it encounters. Now, the rod, or primitive nerve-element has its base immersed in the bath formed of this substance. We have only, then, to suppose in this element the power of feeling, in a different way the intimate contact of different media, exactly as the *papillæ* of the nerves of special sensibility (like those of smell and taste, for example) appreciate or carry to the sensorium stimulations as varied as is the nature of the liquids or effluvia which come to them. When the primary cause, the luminous object, is withdrawn, the nerve-fiber, according to the progress of the reconstitution of the purple, announces by successive testimonies the gradual renewal of the normal hath.

Prize for an Essay on Hydrophobia.—A prize of £100 for an essay on hydrophobia, its nature, prevention and treatment, has been offered by Mr. V. F. Bennet Stanford, M. P. to be awarded by the Royal College of Physicians of London. The questions which are thought by the college specially to require investigation are: The origin and history of outbreaks of rabies, particularly in the United Kingdon and its dependences. The best mode of preventiou of rabies. The characteristics of rabies during life, and the anatomical and chemical changes which are associated with the disease in its successive stages, particularly in its commencement. The origin of hydrophobia in man. The chemical and anatomical morbid changes observed in the subjects of the disease, with special reference to those having their seat in the organs of the nervous system, and in the salivary glands. The symptoms of the disease, particularly of its early stage, as illustrated in well-observed cases. The diagnosis of the disease in doubtful cases, from conditions more or less resembling it. The alleged prolonged latency of the malady. The efficacy of the various remedies and modes of preventing the disease which have been proposed, and what plan of treatment, whether prophylatic or curative, it would be most desirable to recommend for future trial.

Estimation of Iron as Ferric Oxide.—Mr. Sergius Kern, M. E., writes to the *Chemical News* touching the collection of the hydrated ferric oxide, and gives notice of the method used by himself, as it has been remarked that in certain laboratories this flocky precipitate is collected on paper filters—a very tiresome operation. In order to collect this precipitate, a thin platinum funnel is used. The tube of the funnel is closed by asbestos wool, previously ignited and weighed. The solution is next filtered, the precipitate washed. The funnel is then placed on a sand-bath, and when the precipitate is dry the bottom part of the funnel tube is closed by means of a platinum stopper, and the whole is next ignited and weighed. Knowing the weight of the asbestos and of the funnel, the weight of the ferric oxide may be calculated. In this way the weight of many flocky precipitates in a dry state may be estimated in a quick and convenient manner.

Microscopic Measurement.—During the month of August there was held a National Microscopic Congress at Indianapolis, Indiana, and it was there decided that the 1-100 m m should be the unit for microscope measurement in this country hereafter, in place of the 1-1000 of an inch in common use. In accordance with a resolution passed by the Congress, the New York Microscopical Society is taking steps to secure a true division of the m m for a standard.

Entomological.—Entomologists will be interested in knowing that a good report of the proceedings of the entomological section of the late meeting of the American Association for the Advancement of Science may be found in the *Canadian Entomologist*, London, Ontario. This little journal is bringing out many valuable and original papers upon its special branch of natural science, and should receive the support of entomologists on this side of the line.

Mining Share Market.

While mining operations are displaying activity on a ecale entirely unprecedcnted, the market is rather slow and quict, showing the truth of the maxim that the market is not the mine. Perhaps the election has had something to do with the inactivity of the market. Perhaps it is the lack of news from the mines. However that may he, there has certeinly heeu scercely a ripplo during the last week, and the hrokers are reported as smashing eech other's hats and kicking each other's hooks abont the Board-room, in short, trying to find some amusemont to console them for the want of husiness.

The Skae-Flood compromise ie still an uncertainty. The truth prohahly is that no one knows the truth. No great strikee have heen reported during the week, hut work on new claims, and location-making have not languished. It is noticeahle, and is prohahly due to the approach of winter, that the numher of companies incorporated is considerahly less than has been the rule for months hack. It is also worthy of note, that the locations reported as made, are ahout as usual for Bodie, are rather small for tho Comstock, and are increasing in other districts. This is a very favorable sign. It augure the hirth of a refreshing epirit of independence, and may he construed into an argument in favor of real increase in onr mining resources. If a mine is located in an excited region and in close proximity to one that is ahsorhing the market, it may be suspected that a stock joh is intended, with sympathy to hack it. But a mine started in a comparatively isolated locality, must have merits, if it is expected to succeed. If Tom is a good mine and sells high above par, South Tom, Douhle Tom, Original Tom, may all he viewed with suspicion. Whereas, whether Tom he good or not, Dick may he worthy in its own right, and without suspicion, at lcast attaching to its name.

Crevice Mining Company.—The annual mecting of the stockholders of this company was held at their office, 414 California street, on Monday, the 4th inst. The following gentlemen were elected to serve as directors for the ensuing year: E. D. Wheeler, J. W. Winter, Philip Hinkle, Wm. H. Sharp and John A. Chandler. E. D. Wheeler was elected Presidcnt, and Wm. P. Guminer, Secretary. This mine ie located in Gold Hill mining district, Nevada, east of the Yellow Jacket and Crown and adjoining the Homestead on the south. Work has been resumed and we understand it is the intention of the company to open up their mine as rapidly as possihle.

Land Decision.—The Secretary of the Interior has affirmed the decision of the Commissioner in the case of G. W. Davis vs. James Sinclair, involving the title to land near Humboldt bay, giving the land to Davis on the ground of abandonment by Sinclair.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

The Last Item.—The Alpine *Chronicle* has made its last appearance in Alpine county. We hops soon to welcomo it hailing from Bodie. We understand that work will bs rssumed upon ths Mountain No. 1 minc next spring, and that the tunnel will he steadily pushed until tho ledge is struck. This is considered a good mine; $90,000 bave beeu expended on it. The upper tunuel is 400 feet, and tho lower, 1,200 feet below the croppings, and is 1,864 feet in length. Assays from the upper tunnel, 200 feet helow cropping, showed $120 per ton.

AMADOR.

Enterprise and New Hope.—*Ledger*, Nov. 2: Everything has taken a fresh spurt around tbis letsly decaying camp. A saloon, two or three dwelling houses, and a fsw Chinese shantics, aro all that is left of Enterpriss; hut the handful of scttlers begin to feel the kindlings of a new hope that prospsrous days are yet in store. The Pelican, Maguire, Vaughn, Enterprise, and a lot of other locetions, offer an inviting fiald for capitalists. Near hy is the Cosumnes river, with vast hanks of gold-bearing gravel. A poor man cannot work thess mines profitahly. There are a numher of good gravel mines hsre, which if judiciously worked would surrender from $9 to $10 per day over and ebove expenses. The Red Benk, Diving Bell, Big Bank, R. Summer's & Co.'s claims, aro working with fair results.

Items.—The Empire quartz mine is running a full force of men. The ors-hody is from 6 to 7 feet wide, and will certainly yield over $4 per ton—a sum sufficient to leave a margin of profit. Ths California mine, sold lately hy the Sheriff for $1,412.85, amount of judgment and costs, may soon pay off all debts and resums work. R. Stewart is still at work getting his mill at Volcano in good shape for pounding the gold out of Downs' rock. New buildings are going up, on the strength of the Centennial mine. A San Francisco party has offered to put up hoisting works and a five-stamp mill on the Comet, for one-half interest in the mine. The Chicago, Fort Johns, and California Boy locetions are at a standstill. Rumor says the latter will he started up shortly. The Penusylvania is sinking slowly, while its neighhor, the Gover, improves perceptihly. The Monterichard still suits its owncrs.

BUTTE.

The English Company's Mine.—Cherokee *National:* This mine, situated at Badger's hill, ahout a mile from Cherokee, is the only mine in this vicinity in full working order at present. There is a hank of solid gravel 160 feet in hight. The surfece, which washee freely, is worked off to the depth of 75 feet or more, then powder drifts are run in on the hedrock, and the hottom which is mostly hlue gravel, is loosened hy powder preparatory to washing. Ahout 500 miners' inches of water are used at present, which is conveyed from Camp Ravine to a suhstantial reservoir. Two monitors are used, and from 12 to 15 men are employed. The debris tunnel to the middle Yuha is half a mile in length. John Quick is Superintendeut. The mine is owned hy a company of six or eight, most of whom work in the mine. They are being richly repaid for their lahor and enterprise, as this is one of the hest paying mines on the ridge.

Better than Lumber and Grain.—Oroville *Mercury*, Nov. 1: While the prospect in the lumbering and farming husiness is and has heen auything hut flattering, the same cannot he said of the mines. They have yielded in some instances very well. The largest mine in the county ie owned hy the Spring Valley M. Co. and has exceeded anything hitherto done. The Hendricks claim has paid well. The Powers mine, just across the river, has kept up a continual supply of gold throughout the year. It has yielded nearly douhle the amount of any former year. Other and smaller claims have yielded an average of $40,000 per mouth since the rain ceased to fall in the spring.

CALAVERAS.

Valentine Ownership Settled.—*Chronicle*, Nov. 2: It is apparent that the Valentiue mine tronhles are ahout at an end and that the question of ownership can he considered definitely settled. A late dispatch from Washington says that the Secretary of the Interior has refused the application of W. H. Knight for a recoosideration of the Secretary's decision, made June 13th last, which rejected the claims of Knight and A. Lacy for the Mosquito mine. Since then A. Lacy has made application for the Valentine quartz mine, covering alleged undisputed premises, and this, the Commissioner alleges, must he allowed to stand.

Upper Country Mining Mites.—The Champion mill at Wcst Point is constantly in motion. Additional batteries will soon he set at work. Good rock is heing taken from the mine. The Granite mill has been compelled to shut down for lack of watsr. At Mosquito the Banner is in full and successful operation. Rock continues of that good quality that makes the Banner the "peer" of any mine in the npper country. The work of taking out rock has been commenced at the Rebecca.

EL DORADO.

Rich Strike at Kelsey.—*Mountain Democrat*, Nov. 2: It is very rich. One of the owners is now here, and he is constantly plied with offers of $5 to $50 for pieces of the ore. One man picked up from tbs dump, in small nuggets, over $75 in less than 20 minutes. One nugget was found to-day, almost purs gold, which weighs seven and one-fourth ounces. Several others, nearly as rich, have been taken out since yesterday, besids a large quantity of ore that will probably go up in the hundreds per ton. Altogether, it is the richest striko that has heeu made in the mine, which proves that it is improving with depth. The owners ars so well pleased with their prospect that they are going to put up their mill immediately. Meu are now grading a sits and the stamps will he running in 15 days. The arastra is running night and day, but its capacity is not sufficient to work a titlie of the rich ors that is now coming out.

MONO.

Bodie.—*Standard*, Oct. 30: Ths ledge in the hottom of the Bruce winze looks well, and the ore is fine. The Gildea looks well in hoth drifts, particularly in the south. Ths ledge in the face of the Brucs south drift is looking well and yielding fine ore, and looks even better in raising on it in the south end. The general appearance of the mine is very favorable. The mill is running steadily on the ores and everything is working well.

Mono.—The shaft is being suuk very rapidly, a progress of 34 feet having been made during the past week; total depth, 200 feet. The formation is looking very favorahle. At 250 feet a station will he cut out, and crosscutting commenced east and west. The ground in the bottom is easy working. The new engine, which is of sufficient size and strength to carry the shaft to a depth of 1,500 feet, is working splendidly. Ths hoisting works are nearly completed, want of lumber retarding the work. The tiuher for the guides to ths cages, which is of Oregon pine, is heing reccived.

Humboldt.—Ths water has come in so strong es to hccome unmanageable with the pressnt appliances, and work has been stoppsd until the company shall decide as to the mode of removing it. At the time the water was struck the shaft was down 150 feet. The west crosscut was in a distance of 75 feet from the hottom of the shaft, in a very favorahle formation, indicating the approach of a ledge. The east crosscut was in 45 feet, in a formation of decomposed porphyry and quartz. Superintendent Howard will go to San Francisco in a few deys to ohtain machincry for the purpose of resuming work.

True Ten.—Situated on the western slope of Silver hill, hetween the South Standard and Mono and Cross. The shaft is now down 105 feet. Two ledges have heen encountered, hoth of which look first rate, one dipping to the west and the other to the east. At 100 feet a crosscut has heen started west for the purpose of intersecting the True Ten ledge.

Standard.—The mein shaft has hecn sunk during the week nine feet; total depth, 727 feet. The ground has improved very much since last report. The north drift, 300 level, is in 497 feet; progress during the past week, 17 feet. The south drift on the West Standard ledge is in 60 feet from the crosscut. The ledge is two feet wide of very good ore. Tbe stopes continue to look well.

Rustler.—The shaft is now down 158 feet, and still working with a windlass. New hoisting works will he erected at once. The gallows frame is on the ground, and the engine and machinery is on the way hetween here and Carson. The formation is exceedingly good, heing of porphyry with occasional seams of quartz. The location of this mine, adjoining the Bodie, makes it one of the most promising properties in the district.

Syndicate.—The west crosscut from the end of the tunnel, which is 1,550 feet long, is in 85 feet. The rock is hard, showing occasional small strata of quartz. From the east crosscut, which is in ahout 200 feet from the main tunnel, a drift is heing run south in vein formation which looks very favorahle. The mill is running steadily on ore from the Bodie.

Sitting Bull.—The shaft is down 152 feet; progress during the week, 10 feet. The ledge continues ahout the same width and quality of ore as at last report, heing ahout two and one-half feet wide and assaying from $60 to $80 per ton. A new vertical shaft has heen commenced which will intersect the vein, according to survey, at a depth of ahout 117 feet.

Chieftain.—Vein in the winze at the bottom looks as well as usual. Was ohliged to discontinue work in winze, and resumed work on the 85 level of main shaft to make connection for air. Everything working well.

Exelsior.—Making preparations to commence work on this mine, which adjoins the Richer on the north, and will sink main shaft on the same.

South Bodie.—Progress made during past week 22 feet; total depth in main shaft 222 feet. Ground in the bottom getting harder, with quartz streaks. Machinery working well, and all about the mine in perfsct order.

Republic Con.—Crosscut is heing run on the 100 level to interseot the ledge. It is now in 23 feet from the shaft. It will be remembered that assays from ore from near the surface in this mine went $64 per ton.

Orient.—On 100 level a crosscut has been started east and west to open up the veins out in the shaft while sinking.

Bodie Tunnel.—Now in 550 feet. A new contract has heen let on the tunnel to run 100 fset further. Faes is in porphyry.

Charter Oak.—Still sinking in passihle ground for ledge. Will sink 250 fset hefore crosscutting, at which point should cut ledge of the Con. Pacific Co.

Tioga.—Ths new engins is in position. The hoisting works are nearly enclosed.

Bechtel.—Ths east crosscut, on the 700 level, is in 118 feet. The west crosscut is in 114 feet. The south drift has attained a length of 96 feet. There is no particular change to note in the mine.

Keystone.—Work on this claim, which adjoins the Nooaday on tho north, is ahout to he resumed.

Leo.—Still sinking in the shaft, and making good progrsss. The formation is very promising.

Red Cloud Con.—Ths main east crosscut has now attained a total length of 384 feet, and the west crosscut from ths north drift 86 feet. Ground is heing graded for the new hoisting works.

California.—The shaft is down 132 feet; crosscutting cast and west will he commenced in a few days.

Ledges.—The Maryland hes a fine 4-foot vein. The McClinton has a ledge at lcast 2 feet wide, good milling ore. Tne Universlty has a 3-foot ledge. A Bulwer ledge is 2½ feet wide of very rich oro. The Noonday has a 4½-foot ledge of $30 to $40 ore. A Summit ledge is 3 feet wids and looks well. At 86 feet in the White Cloud shaft a stratum 5 inches wide, prospecting slightly in gold, was struck. In the east drift of the Champion minc a ledge 14 inches in width hes heen struck.

New Mining District.—Considerable sxcitement was produced among our prospectors a few deys ago hy the report that some very rich discoveries had heen made ahout five or six miles from Bodie, in the neighborhood of Sunshine, or a short distance west of that station. Some rock was brought into town said to have been taken from croppings at Table mountain, which was covsred with free gold. Other spscimens did not look so well. A considerable number of people have hean out to take a look at the locality, and many more are riding or walking out eech day. We hear that a mining district will he organized. In the early days of Aurora a large amount of rich "float" was found in the neighhorhood of the new find, and many houlders were hroken to pieces and taken to that place and milled, and yielded a hendsome profit to the finder. No permanent ledge has ever heen found, however, although the Real del Monte Co. offered a rich reward to the person who should make the discovery and will it to them. We sincerely hope that the ledge hes at last heen fonnd. It would he hut another link in the chain of evidence to show that this is one of the greatest mineral helts on the Pacific coast, whose wealth may in time rivel thet of the famous Comstock lode of our sister State of Nevada.

NEVADA.

Items.—Messrs. E. Derhec, E. M. Preston, John Pattison, John T. Morgan, and others from this city have located the ridge from Omega to Greenhorn creek a distance of about one and one-helf miles. It is supposed that the old Alphe and Omega leed run down through this ridge. Tbe ledge all along the lower levels of the Pittsburg, averages ahout 18 iuches in width. Between the fifth and seventh levels the rock is very rich. The outlook for the mining interest of Willows valley is very flattering. The Deadwood miue, J. J. Lyons, Superintendent, has recently cleaned up including yield of the sulphurets, over $5,000, an average product of over $40 per ton. The Excelsior W. & M. Co., are ready for the rains. The South Yuha Tunnel Co., running under the South Yuha at Hoyt's old crossing, are pushing energetically ahead. Mr. Austin Walrath has purchased the New England quartz mine for $4,770. From the breast of the Derbec, 21 pounds of gravel washed out $55.71. King's hill ore has latcly yielded $85 per ton in a clean-up at the Orleans mill.

Rough and Ready.—Nevada *Transcript*. Nov. 1: Mr. Scrihener, one of the locators of the Iron Clad mine, which is now being worked with splendid results, has just discovered a ledge ahout one mile southwest of Rough aud Ready, that is believed to he richer in gold than even the Iron Clad. John Fippin, a pioneer quartz miner of Rough and Ready district, and Mr. Muchmore, another experienced gold-digger, are husily at work just ahove Randolph Flat. They sunk a shaft 50 feet deep, striking a ledge that is good-sized and valuahle. Now they are running a drain tunnel into the side hill and to the hottom of the shaft, a distance of 75 feet. This work has heen done within the past six months. They will commence to take out rock before long.

Ridge Items.—The reports from the Manzanita mine are flattering to the immense richness of the gravel deposits of the ridge. The company sent down $36,000 one day last week, the result of a partial clean-up. It is expected that the present clean-up will yield about $70,000. A small force of men is still at work in the North Fork mine, keeping the immense tunnel, which is ahout 4,400 feet long, in good shape. The company has levied another assessment of seven dollars per share on the original stock, or seventy cents on the new. Present stockholders propose to stand by the mine and

Vagrancy and Crime.

We have lately expressed, in as forcible words as we could command, our condemnation of men who endeavor by legal means to rob the helpless and those who admiuister high trusts for their own aggrandizemeut and not for the public good. The glaring evils which have heeu disclosed in the deeds of those who only lately beld the people's esteem, are warnings against pinniug one's faith too freely upon anyone until his habits and methods are clearly understood. Some events wbich have falleu under our observation during tbe last week lead us to remark tbe evil whicb is being done to society by the lower grade of public enemies.

"Judge," said a rural justice of the peace, to a lawyer of high standing, in our hearing; "Judge, why can we not under the vagrant act of this State rid ourselves of the intolerable nuisance of tramps? It has got so now tbat a man is afraid to leave his home even in the daytime, for fear that his family will be robbed, insulted, or worse, hy tbese low-lived tramps who are coming in groups to our houses at all hours of the day. I have thought they might almost all of them be arrested and imprisoned under the existing vagrant act."

"They could he," replied the Judge, "and they ougbt to be. All you bave to do is to establisb tbe fact that they are without visible means of support or are doing nothing to earn a livslihood, and tbey can he committed under the vagrant article in tbe code. It is easy to establish this fact, for most of them will admit that tbey are doiug nothing, but gaining their living as common vagrants. I believe the evil could he materially reduced if the justices of the peacs throughout the Stato should enforce this provision of the eode against those who are a hurden upon honest workers and in fact thieves, incendiaries and criminals of the worst class. Any justice who will begin this work will do a great service to his neighhorhood."

This conversation which we overheard on the oars the other day, was called forth by the incendiary fires, house breakings and incrcasing number of tramps which are observed in the Alameda valley, and we doubt not in other parts of tbe State as well. People living in the country only kuow what a hurden, a meuace and a positive evil are the gangs of outcasts who tread our highways and gain food from our kitchens while tbey plot and execute tbeir abominahls crimes and outrages. The question is, what shall be done? It is well known that but few of these wanderers will work if work is held out to them. If they do a joh it is hecause they canuot get food without it, and as soon as the meal is obtained they take to the road again. What can he dons witb such men except to repress them by legal meaus. If the existing provisions of the cods covers such cases it should hy all means be enforced. For the time heing the State could better afford to hoard the wbole army of tramps in the jails and prisous thau to have them preying upon the community, making the rural housewife's life a continual fear, hurning harns, warehouses and stacks, destroying and stealing property enough in a night to pay the jail expenses for a month. If it he that the code affords immediate relief, there should be concerted action among all ranchers to bring tbe vagrants before a justice of tbe peace aud have them placed wbere they cau do no harm before their evil deeds grow greater. This point should he looked into and proper actiou taken by the members of every country commnnity.

Altbough imprisonment under the code may serve a present purpose and exert a repressing effect upon the floating element wbich now endangers rural comfort and prosperity, it is not so good as somethiug wbich can be had hereafter if tbe people are determined npon it. There cau be no douht that it is now altogether too easy to get a livelihood hy tramping. It is so easy that the life bas a fasciuation for hundreds of depraved, idle and ambitionless individuals. There is such indolence and ease about it that an occasional pinch of hunger is no obstaole to its pursuit. The true theory to meet tbe difficulty is to enforce lahor and turn its products to the puhlic accouut in compensation for the expense which the puhlic has to incur for corrective measures. Other States have systems for forcing vagrants to earn tbeir liviug, and they are said to exert most henefi cial effects. The enactment of such laws in this State has been urged by some of our interior exchanges, who know the extent of the evil as we, from our residence in the country, know it. As the evil seems to be growing, as the evil life of the tramp seems to make him bolder each year and more ready to trausact robbery and outrage together with his beggary, it is plain that a comprehensive and effective act for forcing the vagraut to labor for his support on puhlic enterprises must be adopted in the future as a measure of public safety. Many months will elapse before we can have a legislature to enact a law of tbis kind, and hefore it convenes the subject should he fully discussed in the light of all the experience of the older commonwealths. In such discuesion we are ready to take an active part. But what shall be done now? It will not do to let the burning and robhery go on for another year. It is not wiee to let a desperate class have free couree over our property, waiting until tho wrongs are done and then pursuing individuals in the hope of thrusting them in State'e prison after the fruits of our toil are destroyed. What is the immediate remedy? Is it in the enforcement of the code as tbe Judge suggested? If so, what community will act iu its own defence and lead the way for other tramp-ridden communities to follow?—*Pacific Rural Press.*

The Valenciana Mine, Arizona.

We have had an opportunity of examining a report made hy Henry A. Bigelow, of Prescott, Arizona, to the Prssident of the California and Arizona Mining and Real Estate Agency, on the Valenciana mins, in Black Canyon district, Yavapai county, Arizona. We make euch extracts from the report as may he of interest. The mine is about 40 miles soutbeast of Prescott and 60 miles north of Pbœnix, near the etage road between the two towns. The vein is in the great gold-bearing slate belt which traverses tbe country east of Prescott and the Sierra Prieta and Bradshaw ranges of mountains, in which are many clusters of gold veins known as the Black Hill mines, the Bigbug mines, the Black Canyon (in which the Valenciana is the most conspicuous) and the New River and Cave Creek mines.

The Black Canyon mines were first disoovered in 1864 by Mexicans, who wsre working placers in Turkey creek, on which Black Canyon is situated, and they at once huilt arastras and worked the mine for two years, during which time they extracted, according to Peralta's hooks, over $35,000 in gold.

Three times the Apaches stole from the Peralta party all tbeir horses aud mules and barassed tbe miners so much that they ahandoned the mine, which tben laid unworked till 1870, wben a party of Amsricans worked it for several montbs, taking out about $11,000 by arastras until the silver excitement in the Bradshaw mountains lured them away. In the fall of 1877, J. R. Deroche sorted over the ore left on dump by previous workers as worthless and worked 10 tons which paid $46 per ton. During the prcsent year M. L. Peralta & Co. worked three tons from tbe mine which paid in the Phœnix mill a trifle ovsr $100 per ton—selected ore from the hottom of tbe old workings.

The ledge runs nearly north and soutb and crops out boldly above the surfaco for several buudred feet, where the principal work is done, showing at intervals for 3,000 feet. Tbe main shaft is worked down in the old Mexican etyle by benches to about 90 or 100 feet, and is not timbercd, not being in a safe condition for work. The main opening is made wbere the vein is 20 feet thick and the quartz has heen taken out from wall to wall and 30 feet along the vein. South of the shaft is a good location for running a tunuel in ou the vein which would underrun the old workings and admit of stoping out all the ore to the surface. The quantity of ore in sight is enormous. Second-class ore on dump is estimated at 250 tons, which will pay from $12 to $15 per ton. Tbe quartz in chimney in shaft for ahout 200 feet in length on surface will mill $20. Walls of vein are soft slate. Vein runs down nearly perpendicular and shows every indication of permanency. Quartz is of a grayish white in which gold shows plainly; through richest portiou are copper staine in which not so much gold is visible. A good site for a mill cau be had for the choosing on Turkey creek anywhere from a mile or two from the mine, from whicli to the creek the bauling would he down hill.

At the mins there is no timber. All along the creek, however, is a good growth of eottonwood, willow and ash suitahle for firewood. A heavy growth of pine timber crosses tbe Bradsbaw mountains six miles west of the mine. Lumber and sawed timhers can be bougbt at mills in Prescott for $30 per tbousand.

The Nigger, Browu, Gillespie, Swilliug, Mason and otber gold mines, which have been worked hy arastras in years past, are near tbe Valenciana aud could furnish ore to any mill erected on Turkey creek that would work custom ore. Mr. Bigelow, in conclusion, states that all of the facilities of access and working eousidered, he regards the Valenciana mine as one of the most desirable gold mines yet discovered in Yavapai county.

The Colorado Chloride Find.

A prospector writing to the *Register Call*, describes the Silver Cliff depoeite that are now creating such excitement in Colorado, and are drawiug men from camps heretofore thought very rich. Throughout tbc districts are presented the straugest observable appearances of volcanic upheaval and formation. Onsidian exists in large bodies, hoth iu the porphyry and granite formation, and in tbe most irregular forms. There is an abundance of trap rock occupying a horizontal and shelvery poeition in disconnected flakes. It is also frequently found standing on its cdge, like elate etrata forming dykee intsrmediatc hetween the mineral-bearing agatized quartzite. I would say that from the present workings, together with its peculiar characteristic features, one would be lead to conclude that there are other large deposits not yet found. To me it is a perfect mystery. To say the least, it is marvelous. I cau only compare it to a very extensive dump pile, and I do not believe I could give a better or more comprehensive illustration. Take all dump piles in Gilpin county, place tbem so as to cover an area of 20 feet in depth—for a mine has not yet attained a greater depth. Now tben, mix a vast quantity of dark paint, tben more paint of a greenisb tint, and after a partial desiccation and stiffening of tbe latter having taken place, pour it altogether with tbe former, over and into the prodigious dump pile. The former color would tben represent the manganesc, the latter, the chloride of silver. The natural result would be the filling up of the cavities and interstices of the dump with the composition.

The Mines and the Courts.

Want of Diligence.

In the case of Courts vs. Moore's Flat Blue Gravel M. Co. suit was brought hy plaintiff to vitiate contract, and recover possession of mining ground. A contract was entered into hetween plaintiff and defendant tbree yeare ago, wherehy defendant contracted to sink a sbaft and prospect mining ground of plaintiff. A shaft was sunk until water was reached, and pumping machinery erected. Tben a tunnel was run to drain the mine, and after a few months labor uotbing more was done. The contract is no nearer being completed now than it was two years ago. Tbe plaintiff proves, that due diligence has not heen used; that the bsdrock might been reached by sinkiug the shaft some 435 feet and that the same might have beeu accomplished in a year. Judgment in favor of the plaintiff as prayed for.—*Nevada City Transcript.*

Diversion of Water Right.

Grant and Cooms vs. Mitchel et als. This suit was brought to prevent diversion of water right by defendant and to recover damages for water already diverted. The plaintiffs own a certain piecc of miniug ground in Rough and Ready township, and in running a tunnel for the purpose of mining this ground a spring of water was struck which flowed out of tbe tunnel. The defendant owned a piece of land helow this mining claim over which thc water flowed. Still further down the ravine is a parcel of land owned by plaiutiff, on which they desire to utilize the water. The complaint alleges that the defendant diverted the water from its natural channel down tbe dry ravine for their own use and advantage. Tbis allegatiou is sustainsd hy witnesses. Court gave judgment for plaintiff, with damages at five dollars.—*Nevada City Transcript.*

Reconsideration Denied.

The Acting Secretary has refnsed tbe application for a reconsideration of ths Department's decision of last June, rejecting the claim of Knight and Lacey for tbe Mosquito mine. Lacey is, however, left in possession pending an action on his application for a patent for the same lode under a different mine name.

Irregularly Sold.

W. J. Anderson has commenced three actions in the Twenty-third District Court to reeover from the Vermont Con. M. Co., 60,000 shares of its capital stock, which he claims was irregularly sold for delinquent assessments.

Suit to Prevent Sale.

M. F. Tarpey has brought suit in the Nineteenth District Court against Martin Tarpey and J. W. Brown, to enjoin them from disposing of 8,000 shares of stock of the Daney G. and S. M. Co., held by them as plaintiff's agent. Plaintiff alleges that the sale will cause him a loss of $12,000. A temporary restraining order has heen issued.

Blasting Gelantine—A New Explosive.—A new explosive agent, discovered by M. Nobel, and pronounced by the Austrian Militar-Comite to be bighly suitable for military purposes is likely also to rise bigh in favor for hlasting purposes, and, if all that is told about it he true, to send dynamite entirely in the shade. This substance, called in Englaud "hlasting gelatine," is formed hy dissolving collodion cotton in nitroglycerine in the proportion of 10% of the former to 90% of the latter. The result of the solution is a gelatinous, elastic, transpareut, pale-yellow substance, having a density of 1.6, and the consistence of a stiff jelly. The new explosive is in itself much less easily affected by blows than ordinary kieselgubr-dynamite, but it may he rendered far more insensihle to mechanical impulse by an admixture of a small proportiou (from 4% to 10%) of camphor. Experiments have been carried out, tbe result of which is to prove that the new explosive possesses, weight for weight, 25%, and hulk for bulk, 40% more explosive power than ordinary dynamite. With moist gun-cotton, gelatine compares nearly as favorably. The temperature at whicb it explodes is ahout 204° C., when heated geutly, and 240° C. when heated suddenly. The addition of camphor, however, seems to raise this point to 300° C. Water has little or no effect upou this suhstauce; it may he burned in considerable quantities without any fear of explosiou, and it is as stable and durahle as either dynamite or gun-cotton. The cost of the production of the new article is half as much again as kieselguhr-dynamite, and ahout the same as that of compressed gun-cotton. We bear that a factory has been, or is being, erected in Scotland for the manufacture of the hlasting gelatine for blasting purposes, eo that we are soon likely to hear more of this curioue explosive agent.

The Engineer.

The French and Our Isthmus Canal.

The last meeting of the International Congress of Commercial Geography was recently held at the Trocadero, in Paris, when speecbes were made hy most of the foreign delegates. The most important subject discussed, and the one which claimed tbe principal attention of all, was tbe ship canal across the American Isthmus. The people of tbe United States will he glad to learn of tbe progress that bas been made towards the accomplishmeut of thie work. At the opening meeting, Mr. Ferdinand de Lesseps declared himself entirely in favor of it, aud said that one reason for his opinion was that he was entirely opposed to monopolies. He liked to see competition and many routes of eommunication opened. He was of the opinion that a canal witbout locks was absolutely needed for ship navigation, but he did not helieve that a tunnel would be objectionable. The two routes surveyed hy Lieut. Wyse, and both pronounced as feasible, need tunnels of only 14 and 7 kilometers respectively, wbile the entire length of the canal will he only from 50 to 70 kilometers. Tbe Suez canal, he said, was 165 kilometers long, and had cost 495,000,000 of francs. Statistics shows tbat at the present time it is paying handsome dividends, and its stock is far above par. He estimated the expense of the American canal at something like 300,000,000 of francs, and thought that a capital of 500,000,000 would amply cover all expenscs. He also said that Mr. Levallery, who had been in charge of the work of tbe Suez canal, had told bim that it would be easier to make a canal such as this than one for railroad purposes, on account of the greater room for working.

Mr. Nathan Appleton spoke most etrongly in favor of the canal, in behalf of the United States. He was convinced tbat wben Mr. de Lesscps rang tbe bell, and gave tbe word to say that the explorations had heen sufficiently made, and tbat they were ready to decide upou the routo, delegates from all natione would come to the summons, and that wben the liue was decided npon, and Mr. de Lesseps would start the work of execution, and form the company, tbe capital of $100,000,000, or even twice this sum, would be easily secured. He hoped ths company would be organized in Frauce, with its office alongside of thoso of the Suez canal, with Mr. de Lesseps as President, and that tbere would be a hrauch office in New York. He felt a just pride in what France and the United States had thus far done towards it, and trusted they would continue to work together in the future.

New Railway in Portugal.—One of tbo most important of the new roads about to be built in Europe is the Beira Alta railway, a Portuguese liue, which, forming a junction with tbe northeru railway at Pampilhosa, will cross the Busacs range, pass tbrough the valley of the Mondega to Guarda, and terminate at Villar Formosa, on the Spanish frontier. The total length of the road will be only 125 miles, but the line will be important hecause it will open up a fertile and well-populated district, at pressnt without railway facilities, and also forming the missing link of the direct or iuternational route between Lisbon and Paris by the nortb of Spain. The present railway communication between tbe two capitals is 1,449 miles in length, while hy tbe Beira Alta line it will be only 1,171 miles, or 273 milss less. The contract for its constructiou and working has heen given to the Societe Financiere, of Paris, which binds itself to opeu the road in four years. The Portuguese government grants a cash subsidy of $41,125 per mile, the total estimated cost being $58,595 per mile. For this and other aid in the way of lands and buildings, and exemption from duties and imposts, it will exact a "transit duty of 5% on fares for freights and passengers."

Engineering Poetry.—At a celebration in honor of the completion of the first ten miles of track on the St. Josepb & DeMoinee narrow gauge road, Mr. J. H. Pickering, Superintendent of construction, sang the praise of narrow gauge in a poem, from wbich this is an extract:

> "What! Send an elephaut for a pony's load,
> To eat his head off on a broad gauge road?
> That day is past;—one-third the cost will do.
> To equip a narrow gauge and put it through,
> One-third their charge will yield big dividends,
> And make all men along the line our friends.
>
> "Now what we need is lower transportation,
> To make all business thrive throughout the nation;
> As sources of all wealth comes from production,
> Farmers cannot stand this broad guage suction."

Gauges.—The *Railroad Age* gives the following notes on width of gauges: India has now 7,599 milee of railroad, all of unusual gauges, as follows: 5,612⅜ milee of 5 ft. 6 inchee; 27½ miles of 4 ft.; 1,638⅜ miles of the meter gauge, (3.28 ft.); and 20 miles of 2 ft. 6 inches. Doubtless the advocates of each particular measure are ready to defend it against all others and prove tbat it should be the standard gauge. But henighted India is conaidcrahly hchind our own country in variety of gauge. We can boast the following handsome assortment of widths, several of which, includiug our principal etandard, are wholly unknowu in that unhappy land: 6 ft.; 5 ft. 6 inches; 5 ft.; 4 ft. 9 inches; 4 ft. 8½ inches; 4 ft. 8½ inches 3 ft. 6 inchee; 3 ft. 4 inches; 3 ft. and 2 ft.

Progress of East River Bridge.

The last wire of ths last cable of tbe East River bridge is in place. Six million eight hundred thousand pounds of wire now hang betweeu the towers and anchorage, nnd about 24,000 wires are bound up in the 76 strands that form tbe four great cables. The estimate of Engineer Roebling was that it would take no less than two and a half or three ysars to maks the main cables, but the workmen have been so expert that the whole process of cnble making has not lasted two yenrs. The cables are made about five or six feet above tho position they will occupy after all the settliug has taken place.

To protect ths cables they must bs continuously wrapped with charcoal iron wire, bound about them with the prucision of thread about n spool, and then this exterior must be saturated with nil, thick enough to produce, on dryiug, a viscid gum, and thsn painted with a thick coat of white lead. This preparation will be moisturo proof. This week the last two strands will be lowered into position, and then the 12 strands of each cable, now swinging loose, will be brought about ths seven cables, already bound together as a core, and put into wooden squeezers to be held for wrapping.

The interesting work of wrapping the cables has been begun. The cables nre held in position by wooden clamps, and wrapped from the towers towards ths center of tbe river and towards tbe nnchorages. Sixteen wrapping machines are to be employed. The wrapping machine is a reel arranged to carry a coil of wire, nnd it has handles like a pilot's wheel. An iron cylinder, made in halves so as to fit close about the cable, is worked around by n handle. The wire is first fastened to the cable, and this machine is moved along, slowly winding the wire about tbe cable as though it were a spool of cotton thread. The wrapping will take tbree months.

Russian Enoineers in Afghanistan.—Now that a great war is probable in Asin an engineering enterprise whicb Russin has in hand is of present interest: If different rumors, founded, it would seem, on a common basis, cnn be trnsted, the oft-mentioned and much-discussed scheme of a railway to tbc Russiou possessions in Turkestan has once more been brought forward. A Reuter's telegram from St. Petersburg and tbe St. Petersburg correspondent of the *Independence Belge*, agree in connecting witb this scheme tbe mission of Generul Abramoff to Cabul, and both assert that the Russian government seeks permission from Shere Ali to continue the line np to and beyond the limits of Afghanistnn. Here, bowever, the two authorities part company; one maintaining that the railway intended to connect Russia witb Afgbnnistan is to run from the Rnssian possessions in Turkestan to Cabul; the other that it is to start from the shores of the Caspian sea and go to Herat. The Russian government has resolved to build the long-projected railway througb Turkestan, and General Abramoff is commissioned to obtain tbe permissiou of Shere Ali to "extend the line as far as Cahul." The projuct of a railway from Turkestan to Cabul is one whicb, ns soon as tbe mountainous frontier of Afgbanistan was reached, would present engineering difficulties of a very formidable character indeed. According to Reuter's ngent at St. Petersburg, the Turkestan railway is to go to Herat by a route which a Russian army approaching Herat would undouhtedly take. It is possible, of couree, that the Russian government may have conceived the grandiose plan of huilding more than one railway in Turkestan, or rather one railway with eeveral branches. But if one line only is to be made it will probably, as Reuter's agent suggests, run from tbe Caspian sea to Herat. There seems, in any case, to be seriously a question of a railway for bringing the Russians into Afghanistan.

Laying Out Curves.—A simple instrument has been devised hy E. R. Dale, of England, for measuring tbc diameters of circular curves. It consists of a tube bearing at its lower end a fork, having in its center a feeler pressed ngainst the curve to be measured by a spring contained in the tube. The upper end of the feeler is fitted with a emall rack, genring into a pinion of the spindle of n hand the motion of which indicates on a graduated disk tbe diameter of the circle of which the arc is a part. In order to measure with tbe instrument the central feeler is pushed inwnrd until it, as well as tbe ends of the fork touch the arc to be measured.

The Northern Pacific and the Yellowstone.—The last officinl report says: Explorntious are being made looking to the exteneion of the Pacific Division into the vnlley of the Columbia over the Cascade mountains. Examination has been made of the country west of Bismnrck, and an exteneion of 205 milee to the Yellowstone river is recommended. A branch to Pembina, to sccure the Manitoba traffic, is recommended also; tbe lengtb would be 150 miles tbrough a good country.

Standing Room for the Human Race.—An Eugbshman witb a hobby has discovered tbat there is room for all creation on tbe Isle of Wight. According to the most recent estimate the population of the eartb ie about 1,440,000,000. Two square feet of standing room being allotted to eacb individual, tbie number would cover 66,115 acres; and the area of tbe island is 93,341 acres.

Useful Information.

Engraving by Electricity.—A new invention, which bids fair to revolutionize the msthoda at present employed for the reproduction of works of art, bas just been given to the world from Philadelphia. It is called the "Autoplate," and tho inventor is Mr. Louis Flusson, a gentleman of French birth. By his discovery the negative of a photograph, through the agency of cbemicals, light and electricity, can hs transferred to copper or brass plates in such n manner as to give the platc tbc appearance of having heen executed by an expert engraver. In copying works of art every line, every brush mark is produced with startling fidelity, wbils in landscapes every leaf and blade of grass can be seen exactly as nature made and where nature placed it. In portraiture from life the very texture of the skin and the expression is given with a faithfulness which would be impossible to tbe steadiest hand and sharpest eye. In printing from tbess plntes no chemical ink is used, plain printers' ink being all that is required. By this invention the reproduction of a work of art which would occupy an engraver several months, nnd cost in the neighborhood of $300, can be executed with superior faithfulness in two weeks, at an expense of $50 only.

Leatheroid.—The *American Manufacturer* says tbnt a new chemical product hns just been brought out at Wheeling, West Virginia, uuder the name of leatheroid. This name was selected by its inventors on account of its resemblauce to leather. It is made of two varieties, one being soft and flexible like leather, the other bard like gutta-percha or vulcanized rubbor, resembling those materials in its density, strength and hardness, and like tbem is susceptible of a very high polish. The leatberoid is manufactured from vegetable fiber by a chemical process wbich is patented. It is made in sheets of 12 feet in length by 4 feet in width, and can be made of any desired thickness, from one-hundredth of an inch to one inch. The leatheroid has been tboroughly tested as a substitute for leatber in tbe manufacture of trunks and wasbers, for gutta-percha in combs, napkin riugs, etc., for tin and iron in roving cans and bobbin boxes for cotton mills, for whalebone in whips, for copper in shoe tips, for wood in chair seats, and also used in the mnnufacture of friction pulleys for mnchinery cnms, and in fact tbere seems to be no end to the uses to wbicb it can be applied. Leatheroid can be made of any color, though it is usually made brick red to imitate leather or vulcanized rubber; black, which is used in the manufacture of combs nnd canes; and walnut, which is used in chair seats

Brick Making by Steam.—According to the *Iron Age* there are two brick yarde in tbe country, one at Washington and the otber at Baltimore, witb macbinery for making bricks by steam, which is stated to be very rapid and economical in operation. Eacb of theee establiehments is said to bave a capacity of over 200,000 bricks per day. The clay, after it has been passed through iron rolls, wbich pulverize the small stones and rejects the large ones, ie carried to the top of tbe building and then falls into the dieintegrator, which mnkee 450 revolutions per minnte. Here it ie reduced to a fine powder and pnsses off into a pipe, where, by the addition of steam, it is moistened enough to give to its particles tbe proper cohesiveness. Tbis pipe feede a wheel furnisbed with molde, which, in the two revolutions it makes each minute, turn out 232 bricks. As the wheel revolves tbe bricks drop out on to an endless helt wbich cnries them to a shed eome 50 feet away, wbere tbey are loaded by band upon small cars, whicb are rolled over into drying ovens and allowed to dry there during five hours, the dampness in these ovens being constantly withdrawn by an exhaust fan. After this they are stacked in kilns and fired.

Composition of Pewter.—C. Himly, of tbe University of Kiel, hns published the following nnalyeee of pewter, together with determinations of the specific gravity and the melting point of the alloys examined. The samples contained:

Quicksilver	5.540	4.000	....	....
Copper	3.913	4 070	3 913	8.545

Rusting Rails. — Interesting observations have been made recently on the Cologne-Minden Railroad, Prussin, on the rusting of iron raile. A pile of raile of odd lengtbe were laid on sleepers over a hed of gravel early in 1870, and remained undisturbed until the fall of 1877, there being no use for them. It was theu found tbat they were covered with n layer of rust .12-inch thick, wbicb hnd to be removed by striking tbe rail with a hammer. Tbe cleaned rail weighed only 398.2 lbs., while its original weigbt was 419.1 lbs., sbowing that 5% of the iron hnd been destroyed by ruet which covered the rail quite uniformly. Tbis confirms the observation often made that rnils etacked awny are much more liable to rust tban those laid down in a track.

Fluxes for Alloys.—The beet flux for alloys of copper and tin is resin. It ebould be added when tbe metals are almost melted. Another good flux is sal-ammonia. In using this flux tbe copper is usually melted first and the flux added. Wben it is in tbe musby stats, after the flux has been put in, tbe zinc and tin ars then added. A good flux for old brass is common resin soap. It sbould be added in small lumps and stirred down into the metal when in the molteu state. In forming alloys of different metals the molten metals should always be kept uuder a covering of black glass or pulverized charcoal to prevent oxidation.

What Makes a Car Load.—This question is thus nswered by the *Butter, Cheese and Egg Reporter:* Nominally, an American car load is 20,000 pounds. It is also 70 barrels of salt, 70 of lims, 90 of flour, 70 of whisky, 200 sacks of flour, 6 cords of soft wood, 15 or 20 head of cattle, 50 or 60 head of hogs, 80 to 100 head of sheep, 6,000 feet of solid boards, 340 bushels of wheat, 400 of corn, 680 of oats, 400 of barley, 360 of flax-seed, 360 of apples, 430 of Irish potatoes, 300 of swest potatoes, 1,000 bushels of bran, 130 to 190 barrels of eggs and 15,000 to 26,000 pounds of hutter.

Babbit Anti-Friction Metal.—This metal is made of 1 part copper, 3 parts tin, 2 parts autimony and 3 parts more tin are added after the composition is in the molten state. This composition is called hardening, and when the metal is used for filling boxes, 2 parts tin are used to 1 of hardening. The above alloy constitutes the best anti-attrition metal in use, hut on account of its expenss it is very little used.

Good Health.

The Germ Theory and its Lessons.

The germ tbeory of disease was tbe subject of an exbaustive lecture in Philadelpbia, by Prof. James G. Richardson, a microscopist of high standing. Wbether the germ theory be finally proved or not bis statements are interesting nnd the practical deductions from tbe doctrine are of great sanitary importance. The following is a summary of wbat tbe Professor said: "The germ theory professss to account for tbe phenomena of smallpox, yellow fever, typboid fever, relapsing fever, measles, scarletina, diphtherin, chicken-pox, erysipelas, etc., by attributing tbem to the more or less mechanical irritation and other dieturbances ect up by masees of epores or mycelial threads, developing in the blood and in the nffected tissues. The lecturer did not think tbat it was proved that the minute vegetable orgnnizntions discovered in connection with contagious dieeases were tbe causes, but expressed tbe belief tbat it would be proved at no dietant day. He reviewed tbe chief evidence in favor of the germ theory, and quoted from eeveral eminent foreign pathologists wbo bave lately advoented this doctrine, nnd paid a tribute to Prof. Tyndall for tbe good work he bas accomplished in awakening popular attention to the connectiou between dust (which consists largely of germs) and disease. Tbe lecturer thought that grent benefit would result from its being underetood by every man, woman and child tbnt tbe contagion of smallpox, yellow fever, typboid fevcr, scarlet fever, measles, diphtheria, cholera, etc., is probably composed of exceedingly minute seeds, called spores—so emall that a maes the diameter of one of the dots or periods (.) upon a printed page might contain over fifty millions. Each one of these fifty million of seeds is capable, under fnvorable circumstnnces, of reproducing its kind witb almost inconceivable rapidity. So tbat, euppoeing, for example, tbe zygodesimus of Prof. Letzerich is really the morbific agent causing diphtheria, a particle of tbe grayieb false membrane which appears in the throate of pntients ill with this complaint, although no bigger than the dot mentioned, might contain sepnrate eeeds enough to infect every inhabitant of the whole continent of North America. The obvious deductions from tbese facts strengtben the urgent recommendatione of eanitarians tbat every effort should be made to prevent tbese mohific germe from being let loose, and wben tbey have made their escape to destroy all epores likely to come in contact with unprotected persons. Eacb individual affected witb smnllpox or} any other of the diseases mentioned is, according to this tbeory, to be looked upon as a eort of hot-bed or forcing-house for the eeeds or sporee of tbnt malady. The lecturer said that one of the most miscbievous popular errors, which a general acceptance of the germ theory would necessnrily subvert, is the belief tbat smnllpox and other contagious maladies often nriee without previous exposure to the seeds of dieease. The germ theory teacbes that every new case of contagious maladies is the immediate offspring of a preceding cnse and the direct result of expoeure to tbe cbauce of having tbe epores implanted in the system—an exposure whicb it only required sufficient knowledge, foresight aud care to avoid. In regard to public hygiene, its importance is only surpassed by its simplicity. For such contagious and infectious maladies it is: Avoid at any cost tbe entrance into communitiee of living spores or seede of disease. Sanitary authorities should be nrmed witb almost despotic power in order tbnt tbey may sbut out or kill every one of those actually visible or even tangible eeeds of dieense. Quarantine, disinfection and prolonged detention of pereone, witb disinfection or total destruction of goods from infected districts, is the right of the many at the expeaee of the few."

Does Running Water Purify Itself?

Tbis subjsct is discussed in tbe November *Popular Science Monthly* by J. A. Judson. He takes a decided negative, as will be seen by the following paragrnph: It is not impossible to point out authorities on sanitary matters so wedded to pet theories that they unbesitatingly dsny that the conversion of a pnrs runuiug stream, or even a large river, iuto a conduit for the sewage-filth of a great city, will bave any deleterious effect on the potable quality of the water taksn a few miles below the filth-entering point. It has been dsmonstrated that this is not only false in theory but also in fact. It was Dr. Letheby, of the English "Royal Commission on the Water-Supply of Londou," it is believed, who was the first to announce what has since been proved a fallacy, viz., that "if sewage be mixed with twenty times its volume of river-watcr, the organic matter which it contains will be oxidized and completely disappear while the river is flowiug a dozen miles or so;" and further, tbat "it is safe to drink sewage-contaminated water after filtration." The "Royal Rivers Pollution Commission" of 1868, unwilling that this expression of opinion should remain untested, submitted it to careful and ingenious experimental invcstigation. The rssult is thus annouuccd: "It is thus evident that so far from sewage mixed with twenty times its volume of water being oxidized during a flow of ten or twelve miles, scarcely two-thirds of it would be so destroyed in a flow of one hundred and sixty-eight, at the rate of one mile per hour, or after tbe lapse of a week." And, after mentioning certain details in support of this, the commissioncre conclude with the remark that "it will be safe to infer, however, from tbe above results, that tbere is no river in the United Kingdom long enough to effect the destruction of sewage by oxidation." Dr. Frankland, nn eminent English authority, before the Royal Commission on Water-Supply, gives some strong testimony in support of the statement tbnt it is impossible to remove tbe sewage-contamination from water by any known proccss, natural or artificial, so as to render it barmless, exoept by boiling for a long time, or by distillation; and, as these two processes are impracticnble on a large scale, then, he says, in his opinion, "Water that has once been contaminated by sewnge ought not afterward to be used for domestic purposes; and, inasmuch as it is generally believed tbat the noxioue matter of sewage exists tbere in the form of minute germs, whicb nre probably smaller than bloodglohules, I do not believe that even filtration tbrougb a stratum of chalk could be relied upon to free the water perfectly from such germs."

Best Artificial Light for the Eyes.—Dr. M. L. Holbrook writes: The following are tbe most essential conditions of a good artificial ligbt: It should be steady, and neither very dull or very intense. Flickering lights are nlways injurious. The Argand burner is the best. If a sbade is used it sbould guard tbe eye from tbe direct rays, while permitting a fair amount of ligbt in the room. The eye should not be kept in darkness hy too much shading. A lightly tinted paper is better than pure white for reading or writing. Yellow glasses have been found superior to others in some cases of weak eyes. In rending, the light sbould if possible come from behind tbe person, and the eyes should be allowed to rest a little every few minutes, even when they do not eeem to require it. In the writer's own experience this last item has been found of especial value.

Danger of a Phosphorus Burn.—Tbe *Medical Times and Gazette* tells of a young man, who, while traveling from Paris to Lyons, lit a matcb by scratching it with his tbumb-nail, and n piece of the incandeecent phosphorus penetrnted under the nail and made a elight burn, to which he paid no attention. But after an hour the pain became intense, the tbumb swelled, then the hand, and next the fore-arm. He wae obliged to alight at a station on the journey, and send for a medical man, wbo declared that instant amputation of the arm was necessary. The patient insisted on postponing tbe operation for a few boure, until the arrival of bis fnther, for whom he had telegraphed. Before the latter, bowever, could reacb hie son, it was too lnte; the poisonous matter bnd gninod tbe arm, tben the sboulder, and any operation became impossible. He died in great agony 27 hours after the burn.

A Rare Disease.—From the *Medical and Surgical Reporter* we learn that a case of a very rare affection—the ossification of the muscles of the trunk and limhs—was presented by Dr. Nicoladoni, hefore tbe Vienna Medical Society, in the person of a girl of seven yeare of agc. In tbis case, the disease wae far advanced, having commenced with tbe muscles of thc neck, whence it extended to the epine, the anterior part of tbe thorax, aud the limbs. A numher of tbe muscles were completely ossified. It is stated that there are only three sucb cases on record.

Nosebleed.—The best remedy for bleeding at the nose, as given by Dr. Gleason in one of his lectures, is in tbe vigorous motion of tbe jnws, as in tbe nct of mastication. In the case of a cbild a wad of paper sbould be plnced in ite mouth, and tbe cbild should be instructed to chew it bard. It is tbe motion of tbe jaws tbat stop the flow of blood.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Artesian Wells—No. 5; A Circle of Agricultural and Mining Counties, 289. The Week; Encouragement For Poor Prospectors; Caution to Inventors; The Silver Mill, 295. Mines and Works of Almaden—No. 7; Use of Compressed Air for Sinking Bridge Caissons, 297.
ILLUSTRATIONS.—Ordinary Well Boring Tools, 289. The Almaden Mines, 297.
WHAT AND HOW?—Asbestos, 297.
MINING SUMMARY from the various counties of California, 293-300.
MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 292
NEWS IN BRIEF on page 300 and other pages.
CORRESPONDENCE.—Artesian Wells in San Joaquin Valley; Mariposa County Mines; Locating a Mining Claim; Rebellious Miners, 290.
MECHANICAL PROGRESS.—Getting a Shaft in the Lathe; Driving Nails with a Gun; The English Steel Ship; A Drill for Square Holes; Revival; Cannon Lifters, 291.
SCIENTIFIC PROGRESS.—Determination of Sulphur in Coke; Anthropology, Archæology and Ethnology; Volatilization of Arsenious Acid; A New Electric Battery; Ancient Records; Persistence of Images on the Retina; Prize for an Essay on Hydrophobia; Estimation of Iron as Ferric Oxide; Microscopic Measurement; Entomological, 291.
THE ENGINEER.—The French and our Isthmus Canal; New Railway in Portugal; Engineering Poetry; Gauges, 294. Progress of the East River Bridge; Russian Engineers in Afghanistan; Laying out Curves. The Northern Pacific and the Yellowstone; Stauding Room for the Human Race, 295.
USEFUL INFORMATION.—Engraving by Electricity; Leatheroid; Brick Making by Steam; Composition of Pewter; Rusting Rails; Fluxes for Alloys; What Makes a Car Load; Babbit Anti-Friction Metal, 295.
GOOD HEALTH.—The Germ Theory and its Lessons; Does Running Water Purify Itself? Best Artificial Light for the Eyes; Danger of a Phosphorous Burn; A Rare Disease; Nosebleed. 295.
MISCELLANEOUS.—Amazon Con. Mining Co., 290. Vagrancy and Crime; The Valenciana Mine, Arizona; The Colorado Chloride Find; The Mines and the Courts; Blasting Gelantine—A New Explosive, 294.

NEW ADVERTISEMENTS.

Merchant & Alban, Mining Agents, S. F.; Steel Castings, Chester Steel Castings Co., Philadelphia, Pa.; Electric Model and Machine Works, S. F.; Main Street Iron Works, S. F.; Assessment Notices—Mineral Fork M. & S. Co.; Land Purchasers' Association; Delinquent Notice—New Basel Con. Gravel M. Co.

The Week.

The mining interests of our coast are certainly developing with wonderful rapidity. The rottenness of railroads and banke and other corporatione has turned the confidence of the people from them, and the result is that capital is seeking hetter investments in the minee. This is what has been needed for so long in many of our miniug districts, and it will lead to astonishing results. We have the mineral wealth—there is no douht ahout that—and all that is wanted is careful and intelligent playing of capital upon the mines, to hring down tons of hullion. See, for instance, the mines of Idaho, acknowledged rich, yet scarcely opened. Vast tracts of gravel is idle hecause there is no money to build 20 or 30-mile ditches. Quartz ledges worked to an average depth of only 300 feet, down to first water, and no further hecause there is not the money for requisite pumps. But even in Idaho, which, for the reason that the railroad does not go so near her as to many other rich districts, has attracted less notice than her merits deeerve, there is a feeling that capital is now heginning to appreciate her richness, and this feeling is suhstantially hacked by the fact that men are now comiug to examine her mines and are discussing the feasihility of certain water works.

The excitement in Colorado still continues. The great want of her mining camps seems to be greater facilities for transportation.

In California the hydraulic miners are longing for rain, while the ledge miners, at least of Bodie, hope that the winter will hold off until they get under cover.

The extraordinary developments in Bodie, have attracted atteution to other neighhoring districts, some of them new, othere, like Bodie, old and generally considered heretofore as of little value.

Encouragement for Poor Prospectors.

A proposition has heen suhmitted to the Constitutional Convention, now convened at Sacramento, providing that "any miner who shall discover a lode or lsdge of gold or silver quartz shall be entitled to $1,000 reward, provided he shall have sunk a shaft or winze a hundred feet." This proposition may have some special significence not implied in its tsrms; but however that may hs, it is suggestive of a subject thet is at least worthy of thought and discussion. Ie the prospector who opens up a gold or silver quartz ledge a servant of the State ahove all other men who strive in their own interest against difficulties? Or are the ohstacles he meets with, and the risks he takes, eo great that the State ehould step in and lend him a helping hand? If aid is to he extended to him, should it not also he offered to the discoverers and developers of gold placers and of deposits of any ore of silver, if not of valuable ores of any metal?

The prospector is generally a poor man. His tours lead him away from society into wild, uninhahited regions. He exposes his life not infrequently, and at heet has a rough if not a dangerous time of it. He employs his cultivated "cunning," his prospector's instinct, in spying out deposits of valuable mineral, each of which adds to the known resourcee of the country. The law provides for his reward, hy prescribing means hy which he may locate hie find, and ohtain, hy reasonahle outlay of money, a good title for it. But while hc is deciding how to locate his claim, he runs the risk of losing the results of his trouhle and skill. Others, catching the idea from him, may get ahead of him and locate all or part of that which, after a little examination, he might have located himself. Even after his location is made, and hefore he has ohtained a patent, he must expend a oertain amount a year upon his claim in order to hold it. These are difficulties, but not greater than a man meets in any field of fierce oompetition. The mincr encounters them, hecause he hopes in the end to gain; and if he is sharp and energetic, and his claim is really valuahle enough to he considered a worthy addition to the country'e resources, the chances are tbat he will enter into his hope.

This is apparently contradicted hy frequent experiences. Suppose the prospector has opened up a rich claim, proved to he so by a tunnel 100 feet in length, or a deep shaft; too oftcn he cannot go on, and win hack even what little the developments have cost him. It takes a mine to run a mine. Nor can he sell his claim for what it would probahly bring him if he could work further on it himself. He is poor, and has immediate necessities; he has hurdened himself with debt already in running his little prospecting shaft. He cannot wait. Capital is uot hungry, and can wait. The miner must take one of the first offers. Suppose he does not—suppose he continues to lahor at his mine, without any of the necessary appliances, waiting for a hetter offer. He will run in deht faster than the offers will rise. If he delays long the sheriff will appear. If things do not come to snch a etrait as this, the hest he can do is to slowly peg away; keeping hie head just above water, making now and then a littlc strike that calls forth his own hope and the oongratulatione of a few friends, hut on the whole feeling his venture a failure, and his perseverance a poor investment.

Suppose, on the other hand, that he accepts the firet offer. On Saturday afternoon he sells hie claim for $1,000 to a cunning capitalist; on the morning of the following Monday, the cunning capitalist sells the claim agaiu for $10,000. There is $9,000 out of the prospector's pocket. That is hard, is it not? It eeems so, indeed, hut it has its parallel. Sam Johnson sold Rasselas for a mere song. The puhlishers who hought it grew rich. Middlemen everywhere are living on the community. They are, to a certain extent, an ahsolute necessity. Would it pay the State to take in hand the grievanoee of careless, eccentric, unpractical Johnsons? Would Johnson he more justly dealt with, and would the English world of literature be enriched hy the offer of $1,000 to every man who ehould write an equal to Rasselas?

These thoughts are suggested by the proposition quoted. Others are in point. The mineral lands are owned hy the United States, and are opened hy the General Government to location and purchase. The State has nothing to do with them, so far. At the eame time there may he no ohjection to our offering inducements to miners to prospect our mountains, as the profits of any industry so started will accrue to the State more than to the United States. Still it is rather questionahle whether the State can afford to pay $10 a foot, for all the hundred-foot ehafts in the country, which might he started hy this proposition; especially when nothing is said ahout the amount of gold or silver in the ledge. There are lots of poor ledges, yet they contain some gold and silver, and many mines are fouud on which shafts are sunk, when all that comee from them will not even pay for the shaft.

University Ore Collection.—The University of California is desirous of forming an ore deposit collection, and has issued a circular to that end, asking mine owners and miniug men to contribute mineralogical specimens for the museum to the University, which Wells, Fargo & Co. have agreed to forward free of charge.

Caution to Inventors.

In a recent numher of the "Official Gezette of the United States Patent Office" appears a special order from the Commissioner of Patents disharring from practice hefore the Bureau a patent agent who had heen guilty of gross misconduct. The attention of the office had heen called to circulars published by this person, containing gross misstatements calculated to deceive the public, so that hereafter he will not be recognized as an attorney in the prosecution of cases in the Patent Office.

In connection with the order referred to, the Commissioner makes some pertinent remarks on the suhject of specification writing, unreliable agents, etc., which are worthy of careful perusel by all inventors, as the statements made apply to agents and inventors in every part of the country. Coming from the source it does—the head of the Patent Department—the warning given ehould have weight enongh to impress itself upon all inventors and cause them to he more careful in the future as to whom they entrust their interests. The Commissioner says:

"So many complaints have heen recently made of ignorance or neglect or fraud on the part of those professing to act as attorneys, that a repetition of the cautions heretofore given hy the Office seems now necessary. The preparation of specifications in simple casee eveu requires technical knowledge, familiarity with the useful arts and with the pateut law, and resources in the form of books of reference and recorde of inventions.

"Commissioner Burke (see Report for 1852, p. 451) said:

"'No great aid is to he expected in drawing up the suhstance of thc specification from any forms. The character of the devices described varies so widely, and the details to be emhodied demand such a different consideration and expression in different cases, that the language adopted on oue occasion can rarely he employed on another without great modification.

"'There is hardly any class of documents in preparing which so little aid is to be derived from precedents; none where more depends upon skill, experience, and ingenuity, or where these are more indispensihle.'

"Yet a large percentage of the cases filed in the Office are prepared hy men who have uone of the requisites named, and little knowledge heyond mere forms. These are often suhordinates dismissed from the Office or from private firms for incompetency or fault, or draftsmen or model-makers. The specifications filed hy these attorneys are frequently so imperfect and ohscure as to he unintelligible and utterly unfit for puhlication, and the preparation and conduct of these cases increase the lahor of Examiners, and are a fraud upon the inveutors.

"The Examiners of the Patent Office cannot undertake to do the work of attorneye hy rewriting and correcting epecifications. Their first duty is to see that the papers are in proper form, to notify the ettorney when and where corrections are needed, and, of course, the more ignorant the attorney the more corrections are required, and the greater are the annoyance and trouhle to which the Examiner is suhjected. It is an Examiner's duty to reject an application if the thing claimed ie old, or if the applicant has claimed too much, hut it is no part of his duty to notify the attorney when he has claimed too little for his client. It is sometimes done, hut it is oftener omitted, and the inventor of a valuable iuvention gets a worthless patent. Inventors are, therefore, urgently advised to avoid illiterate attorneys who advertise to work at the cheapest rates, hut whose services are dear at any price, and to seek the aid of those whose experience and technical and legal knowledge are hased on a liheral education, and who are in good standing at the Patent Office and hefore the country.

"In all of our larger cities, where there is a demand for patent practitioners, there are men to he found who are willing and ahle to give inventors salutary advice, and iuventors in any part of the country may find responsihle parties ahle tc give them advice as to the selection of attorneys of long and well-known standing.

"Inventors are particularly cautioned against men who claim to have special facility in the Office, or who intimate that money may he used to hasten or assure the allowanee of their cases.

"Inventors who are tempted hy circulare or letters coutaining intimations of the possession hy those who issue them of secret influences in the Patent Office will do well to note the following remarks of Commissioner Fisher:

"'Inventors ought to know that if they are foolish enough to pay their money upon such pretences, it will uever reach the pockets of the Government officials for whom they suppose it to he designed. It goes no further than the unscrupnlous attorney or agent, who, assuming to trade upon the supposed corruption of eworn officers, is willing to slander houest men, and destroy puhlic confidenco in the administration of public affairs, in order that he may enrich himself at the expeuse of his credulous client. Instances have come to my knowledge where money has heen extorted from clients hy agents after patents had heen actually allowed, hut not yet issued, upon the pretense that it was necessary to hrihe the Examiner. I know of no case where the money went heyond the solicitor. No practitioner can assert with truth that he possesses any facilitiss by which he is enebled to procurs petents in advance of any of his competitors heyond his knowledge of the forms and routine of the Office and his skill and care in ths prsparation of his cases. To take money from his clieuts under the prstense that it is to he used to procure such facilities is to add theft to falsehood. * * *

"'It will he a safe rule to distrust those who hoast of the possession of special facilities in the Office for procuring patents in a shorter time or with more extended claims than others.'

"Inventors, when attorneys or others demand exorhitant fees for supposed secret or improper influences in the Patent Office, will do themselves and the Office a service hy hringing such commuuication to the personal attention of the Commissioner.

"The caution of Commissioner Fisher, quoted ahove, has heen embodied in pamphlets of attorneys; among others, in those of the very men against whom it was directed; and if the present caution meets with the same fate, inventors may understand that its appearance in a circular or pamphlet is hy no means a guarantee of the ahility or honesty of those from whom the circular or pamphlet emanates.

"The remedy for the evils arising from ignorant and dishonest attorneys is in the hauds of the inventors themselves. Let them exercise the same caution and judgment in selecting a patent solicitor which a prudent man considers necessary in selecting any other professional man—a physician or conveyancer, for instance—for performing duties which demand experience and exactitude, and the Patent Office would soon be relieved from the time-consuming annoyauces caused hy unskilled pretenders, fewer worthless patents would he issued, and less vexation and cost would arise to applicants from the rejection of cases, meritorious in themselves, hut unfit to issue merely hy reason of the bad preparation of the papers."

The Silver Mill.

This is the title of a little pampblet by M. P. Boss. It consists mainly of a number of maxims for mill-men, "deduced from a practical experience." A valuable suggestion is thrown out in the Introductory. "Iron producers, scientists, and railroad engineers have their societies for mutual benefit. Minute details of facts and forme which they develop conduce to general improvement. But no society of practical, actual workers in mining and metallurgy, as developed in the U. S., exists to accumulate and retain, from their several experiences, tbat minutiæ so essential to the maximum of economy and success." The writer takes up "Crushing," mentioning various feeders and noting their success or failure. "Amalgamation," "Quicksilver," "Quicksilver Pump System," "Quicksilver Pressure System," "Amalgam" are treated of in order. Mr. Boss is the inventor and patentee of a quicksilver pump system, and this is illustrated and described in detail. We shall soon find occasion to give extracts from the pamphlet.

Lixiviation versus Amalgamation.—In a late issue of the Press a short article on this subject was published. It favored the former process rather than the latter, and at the close the writer, W. T. Rickard, F. C. S., of Tucson, was asked to furnish some explanation of the failure of lixiviation in parts of California, Nevada and Utah. We are happy now to acknowledge the receipt from Mr. Rickard of an answer to the challenge, if it may he called such. The letter will he published in the next issue of the Press. This suhject is a very interesting one and we shall he glad to hear more of it from mining men. There is no doubt that the lixiviation process has made failures as well as successes, yet it has heen strongly hinted that with fair opportunities opened to it, that process might supersede amalgametion in our most important mining districts, and greatly to the advantage of said districts. If this he the case, our miniug men should give more attention to it. Let us hear from more of them.

A new mining district has been organized in Washoe county, Nevada, four miles north from Reno, called the Reno mining district. Some 20 or 30 locations have already heen made and the prospects are now quite flattering. The average of six assays taken from the Esmeralda Con. at a depth of 70 feet, is $106.78. Two companies have hecn recently incorporated, namely: Esmcralda Con. M. Co. and the Monona M. Co.—the same directore to act for both companies, viz: Isaac Parry, B. S. Coggeshall, C. F. Clark, H. E. Parry and T. V. Julian. Isaac Parry, President, B. S. Coggsshall, Secretary. The office of the coupauy is 309 Dupont street.

Bullion Shipments.—Standard, Oct. 30th $16,929.19. Orieutal Con., Nov. 2d, $221.16. Bodie, Oct. 28th, $12,952.04; Nov. 2d, $24,943.83; Nov. 5th, $13,500. Extra, Oct. 31st, $6,262. Belmont, Oct. 30th, $7,661.25. Christy, Oct. 31st, $5,241. Northern Belle, Oct. 30th, $3,159.38; Nov. 2d, $4,364.34. Independence, Nov. 4th, $14,000. Indian Queen, Oct. 28th, $4,848.85. Mines and Works of Almaden.—No. 7.

[Translated for the Press from "Annales des Mines."]

II.—Mineralogical Constitution of the Vein Matter.

There remains, in order to complete this description, to give some description of the mineralogical filling up of the veins, and to determine in what manner, and at what epoch this filling up took place.

The cinnabar presents in each rock a different aspect; it impregnates quite regularly the white and black sandstones, and forms simple patches, very rare at that, in the frailesca, the limestone and the schiste. It occasionally presents peculiar physical characters. When the schiste is in contact with the black sandstone, one meets it sometimes in cavities or in little veins between its layers, which give to the transverse fracture of the rock the aspect of a pack of cards, of which the edges are alternately black and red. At other times the schiste is entirely replaced by cinnabar in imperfect crystals, and more often by masses apparently sedimentary, who conform to the schistose structure of the primitive rock. This rarity, to which has been given the name of *schistose cinnabar*, is rare at Almaden, but it seems to have been more common in the ancient mines which are now abandoned—the Fueares to the west, and the Concepcion Nueva to the east of Almaden. The appearance of this rock, which was formerly regarded as sedimentary, while the cinnabar was supposed to be deposited at the same time as the schiste, shows how easy it is to be deceived in judging of the origin of certain ores solely from their appearance and from the examination of a few specimens.

The name *stalactiform cinnabar* has been given to certain agglomerations of powdered cinnabar, carried along by water, and afterwards deposited from it. These recent deposits of cinnabar of an entirely mechanical origin do not constitute, properly speaking, a special variety of the ore.

Pure cinnabar, crystallized, or in mass, is only rarely found. Without doubt a great number of cryetale of cinnabar have been found in the mines of Almadeu, which figure in the mineralogical collections of the entire world, but it suffices to say that all of which present cryetallizations, even slightly pronounced, are collected as curiosities, in order to understand that these crystale occur but seldom. The ore is more frequently accompanied by very small crystals of quartz and of sulphate of barium; iron pyrites is said to have been found in some specimens; this last substance, if it exists at all in the cinnabar of Almaden, is found very rarely.

Pure amorphous cinnabar is more frequent; that is called pure cinnabar, all which contains from 75% to 85% of mercury. It is found disseminated in an irregular manner in the midst of the cinnabariferous sandstone which forms the mass of the deposit, particularly in the San Pedro vein.

Native mercury is not very abundant at Almaden; one never finds it except alone, without cinnabar, in a very schistose quartzite of a dark-gray color, of a very compact appearance, sometimes in the sterile schiste or in the decomposed sandstone. It is true that sometimes drops of mercury are seen oozing from the walls of the galleries, but these come evidently from an altogether recent decomposition of the cinnabar exposed to the air.

Horn quicksilver has not been found at Almaden itself; it is found only at the mine of Valdeazogues, in a very decomposed white sandstone, where it presents itself either in pellicules, and in slender crusts, or else in prismatic crystals with square base with globulee of metallic mercury. The old mines of Guadalperal and Valdeazogues have furnished also some specimens now deposited with the collections of the geological map at Madrid, in which the cinnabar is associated with carbonate of copper (Guadalperal, la Concepcion), and with copper pyrites with malachite (Guadalperal.) One can see two kilometers north of Almaden, a layer of devonian quartzite containing spots of cinnabar and cupriferous efflorescences. This was prospected for copper some years ago, but was at last abandoned.

But all these substances which we speak of as sometimes accompanying the cinnabar of Almaden form altogether a quantity almost neglectable. In spite of the fact that in ordinary veine we find usually an association of divers metals, mercury, as was a long time ago declared by Ant. de Jussien, in a memoir read before the *Academie de Sciences* *, presents itself alone, and seems to avoid the presence of the other metals. The only affinity which it seems to possess in nature is its predilection for carbonaceous or bituminous matters at Almaden as in nearly all its deposits. We know that it is found at Idria, in the midst of bituminous strata of the triasaic (*brandschiefer, leberschiefer, silbershiefer.*) At New Almaden it is associated with a veritable coal. †

In Austria, a cinnabar mine has been exploited, where it impregnates beds of sandstone and of coal schiste; they have even found there a bed where cinnabar is associated with coal.

The presence of carbonaceous matters is less pronounced at Almaden, but it is incontestible. The schistes are often, when in contact with the veins, black, lustrous, carbonaceous; they stain the fingers. Proust, who analyzed some samples from Almaden, found a little plumbago.

But the most interesting study is that of the ordinary ore, quartzite more or less impregnated with cinnabar. When one calcines this so as to expel the mercury and sulphur, the rock appears like scoria, or a decomposed mass, which cannot hold together, and reduces itself entirely or in part to sand. The consistence of the residue enables us to judge almost exactly of the ore; from pure cinnabar nothing is left; and the calcined gangue resists less when the ore is richer. When on the contrary fragments of barren quartzite are calcined, they preserve their primitive structure and their primitive hardness.

The material of the quartzite which is wanting to-day in the rocks impregnated with cinnabar, certainly could not have been missing, neither at the time of the first deposit of the beds, nor after the strong pressure which compressed and straightened them. How could this disappearance of silicious matter be effected; matter inattackable by all the reagents which we can imagine intervened during the epoch of the formation of the veins of cinnabar? We do not pretend to explain this, and we renounce the reproduction of the diverse theories, all, more or less inadmissable, which have been proposed on this subject.

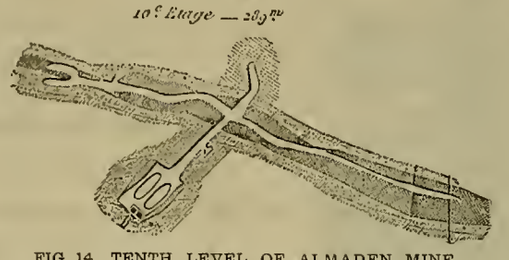

FIG. 14. TENTH LEVEL OF ALMADEN MINE.

III.—Age of the Veins.

The epoch at which the advent of the cinnabar took place, is not less difficult to point out. Incontestibly the cinnabar is not contemporaneous with the deposit of the silurian or devonian strata in which they are found. All that we know opposes this. According to all geologists the mercury, as all other metals, comes from the bowels of the earth. We find in the region of Almaden many rocks which have the same origin. These rocks have appeared at different epochs; in fact we cannot admit that the granites of Pedrochus are of the same age as the porphyry of Almaden or Chillon, or the trachytic porphyry of Gargantiel.

Is the appearance of any one of these rocks concomitant with that of the mercury? Some facts permit this hypothesis. The most important is the presence, in contact even with the cinnabar, of a melaphyric rock at the eastern extremity of the San Francisco vein, at the 9th level. We have also said that cinnabar in spots and little veins has been found at Almadenjos and at Guadalperal, in a rock intimately related to the melaphyres which form near this village a considerable mass in the midst of devonian strata. Finally, mercury in the metallic state at the contact of the melaphyre of Chillon with the sandstone. There have even been opened a shaft of 12 to 13 meters depth, which was afterwards abandoned, after having collected some kilogrammes of this metal; although this shaft has been open for 25 years, the debris of the excavacation are still about its mouth; it is composed of a melaphyre where the crystals of the quartz are less abundant than in those of the mines of Almaden. However, I should say that some doubt exists as to the origin of this mercury. No cinnabar is to be seen in the rock; the shaft is situated in the court-yard of a house, and it was suspected that the mercury might have been stolen and hidden under the ground for a long time and infiltrated into the fissures of the earth. This is only a suspicion, and the discovery of the melaphyre in contact with the cinnabar at Almaden itself, gives reason to believe that it is not well founded.

We admit then, as a fact, if not absolutely certain, at least very probable, that the cinnabar shows a preference for contact with the feldspathic rocks of Chillon, of Almaden, and of Guadalperal, and in some places is formed in those very rocks. We have already spoken of the great analogy presented from a purely petrographic point of view by the melaphyres of Chillon with those which come to the surface towards the end of the permian epoch, in the Vosges, and near Oberstein in the Valley of Nahe. *

Now in the Palatinate, as at Almaden, the melaphyres are in in intimate relation with the veins of cinnabar; † these veins are sometimes found in contact with the melaphyres, sometimes they traverse them as at Rathsweiler, Erzweiler, Baumholder; the presence of spots of copper ore, principally of carbonates of copper, spoken of already, completes the analogy; the cinnabariferous veins of the Palatinate are also accompanied by several copper veins.

We there ore think we are justified in assigning to the cinnabar of Almaden the same age as that of the Palatinate; it even seems to us, according to the description which M. von Cotta ‡ gives of it, that we can attribute to the same formation the deposit of cinnabar of Vallatta, near Agordo, which is also found in connection with rocks designated by the German geologists by the name porphyry, and near to the great copper vein of Agordo. We will abstain from the expression of an absolute opinion as to this age; it suffices for us to have determined with exactness the conditions of the deposition. We will say, however, that relation indicated would be difficult to explain if we did not admit that the cinnabar has appeared a little after the eruption of the melaphyres, nearly at the same time as the copper ores, which constitute, for example, in the permian layers of Mansfeld, the layers of cupriferous schiste (*Kupferschiefer.*) The cinnabar would then appear at Almaden a little later than that of Idria, which presents, however, conditions considerably different from those of Almaden, and which is now recognized as triassic.

It is to be understood that we cannot be absolutely certain upon these questions of age, nearly always so delicate; we hardly know (to-day) in fact, what name to give the deposits of Almaden. Since the last century Bowles and Hoppensack have given them the name of veins, and for a long time they went by that name. Several geologists protested, however, against this denomination, among others, Casiano de Prado. He points out the differences, frequently considerable, between the aspects of the deposits of Almadeu and that of ordinary veins; he declares that mercury never presents itself except in stratified beds, into which it is infiltrated from below. This is certainly a singular fact, and one which from its generality merits attention. Is it not due to the fact that the clefts which contain cinnabar were made by forces not sufficient to produce rupture across the strata, but only in the direction of their length?

From the moment that we admit with M. de Prado, that the mercury came from the interior of the earth; from the moment that we recognize in the deposits of Almaden the form of bands relatively straight, which follow a direction and inclination tolerably determined, we do not see how we can refuse to them the name of *veins*. We could give them the name *vein beds*, or that of *contact-veins*, but we should always recognize in cinnabar the character of a vein substance, carried to the surface very probably in the state of vapor.

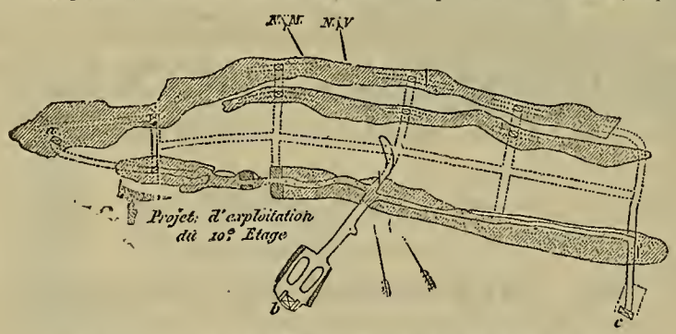

FIG. 15. PROJECTED EXPLOITATION OF TENTH LEVEL.

---

* *Memoires de l'Academie des Sciences, 1717.*

† The bituminous matter at New Almaden is not "a veritable coal." It is sometimes found with the external appearance of coal, but when heated melts like bitumen, and burns without any ash to speak of. It is more usually of the color and consistence of coal tar and flows out of the drusal cavities in which it is usually found when they are opened.—Editor.

[To be Continued.]

What and How?

In this column are printed all sensible inquiries relating to and connected with mining or relating to any matters of general scientific interest; also the answers to them as dictated by individual experience, or as furnished by correspondents.

Asbestos.

"Prospector" writes to us from Sacramento making several inquiries which he will find answered below in brief. We have, in previous numbers of the Press, described the characteristics, uses, method of mining, value, etc., of asbestos in detail, all of which information can be obtained by examining our files.

Asbestos is used, in connection with liquid coating, on roofs, as a protection against fire, in rope of different sizes, for packing of gland-boxes and valve-stems on steam engines; in board, for gaskets for flange-joints, man-hole plates, etc.; in cement felting, for covering boilers, steam-pipes, smelting-furnaces, etc.; in fire brick, paints, lamp wicks, kindlers, and for many other minor purposes.

The qualities can be determined only by an expert. The best material has long, strong fiber, easily separated, without luster and free from silica.

The principal manufactory is that of the H. W. Johns Manufacturing Co., at foot of Thirty-ninth street, Brooklyn, N. Y., (office, 87 Maiden Lane, N. Y. city, with branch at 5 First street, San Francisco), and the Salamander Felting Co, of New York, with branch at 317 California street, San Francisco.

To H. W. Johns belongs the credit of first utilizing asbestos in this country.

The largest deposits are on Staten island, New York harbor, where pockets are often found containing 50 to 70 tons; and in the mountains of western Georgia, where the veins are from 1 to 8 feet wide. This mineral is found in so many different formations that it is impossible in short space to properly describe them. It is found in quantities all over this coast, both of good and bad quality.

It is worth in New York from $25 to $60 per ton for American, and from $100 to $300 for French and Italian. Here it is worth from $30 to $35 per ton when a first class article.

Use of Compressed Air for Sinking Bridge Caissons.

In the admirable article on the "Transmission of Power by Compressed Air," by Robert Zahner, M. E., in *Van Nostrand's Engineering Magazine* for November, 1878, page 446, *et seq.*, it is stated: "Without going into details as to its history, we shall only name the English engineers, Cubitt and Brunell, who, in 1851-54, first applied compressed air in its statical application to the sinking of bridge caissons."

As a historical fact we merely wish to state that the application of compressed air for the above-indicated purpose was certainly made at least 10 years before the date given by Mr. Zahner. As early as 1841, M. Triger, a French civil engineer, employed compressed air during the operations necessary for working a bed of coal lying under the alluvium bordering the river Loire, near Lauguin, in the department of Maine et Loire. In traversing an overlying stratum of quicksand, from 18 to 20 meters thick, he found it requisite to devise some means of excluding the semi-fluid quicksand and water, which found their way under every arrangement analogous to ordinary coffer-dams or caissons, in such quantity as to defy all pumping operations intended to keep them dry. For this purpose, M. Triger employed large sheet-iron cylinders, about 1.033 meters in interior diameter, securely closed at the top, in which (by means of a condensing pump incessantly worked by a steam engine) air was condensed to an amount sufficient to counteract the external hydrostatic pressure. The ingenious contrivance fully justified the expectations of the engineer. It proved to be entirely successful. The details of M. Triger's operations are recorded in "Comptes Rendus," Tome XIII, p. 884, *et seq.* Paris, 1841; also "Annalee de Cbimie et de Physique," third series, Tome III, p. 234, *et seq.* Paris, 1841.

Pacific Coast Postal Changes. — Offices established—Contra Costa, Cal., Henry Wilkenning, Postmaeter; Date Creek, Yavipai county, Arizona, Henry Addoues, Postmaster; Tebbsdale, Iron county, Utah, Daniel F. Tebbs, Postmaeter. Names changed—Mosquito Gulch, Calaveras county; Cal., to Glencoe, and Julius A. Lindsay appointed Postmaster. Postmasters appointed—Thomas J. Gould, Hermitage, Mendocino county; George C. Shaw, Omega, Nevada county; Frank W. Hilton, Round Valley, Inyo county, Cal. David Wigginton, Scholl's Ferry, Washington county, Oregon. Darius Rogers, Ferndale, Whatcom county; Wm. L. Steinweg, Sehome, Whatcom county, Washington Ter. J. H. Walcott, Ophir, Tovela county, Utah. Joseph Guindare, Florence, Pinal county, Arizona.

In the Treasury, Nov. 5th, there was about $137,000,000 gold available for resumption.

DEWEY & CO.
American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E.COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Pateuts and Assignments; Every legitimate branch of Patent Ageucy Business promptly and thoroughly couducted.

Our intimate knowledge of the various inventions of this coast, and long practice in pateut business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experieuced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

FRED. M. PATRICK, Manager.

Barlow J. Smith, M.D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervous derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The Institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic hoard, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

KING ENGINE.

The Only SAFE BOILER.

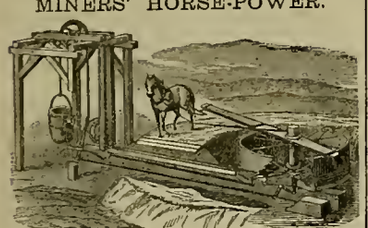
SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO, Sole Agents,
18 & 20 Fremont Street, San Francieco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to oed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

CARDNER'S Celebrated Governor

These Steam Governors have long been known as THE BEST, and as lately Improved and Perfected, they have no Rival.

THE SAFETY STOP

On these Governors is alone wortb double the price of the Governor. We have sold over six bundred, and

Never one has Failed.

They are sold at the same price (or less) as ordinary Governors. Send for Circular.

BERRY & PLACE,
Market, head of Front St., San Francisco.

Established 1844.

JOSEPH C. TODD,

ENGINEER —AND— MACHINIST.

Flax, Hemp, Jute, Rope, Oakum and Bagging Machinery, Steam Engines, Boilers, etc. I also manufacture Baxter's New Portable Engine of 1877, of one horse-power, complete for $125; can be seen in operation at my store. Two horse-power, $225; two and a half horse-power, $250; three horse-power, $275. Send for descriptive circular and price.

Address J. C. TODD,
10 Barclay Street, N. Y., or Pattereon, N, J.

ICE! ICE!! ICE!!!

Ice at $1.00 Per Ton.

PICTET ARTIFICIAL ICE COMPANY, (Limited).

Room 51, Coal and Iron Exchange.

P. O. Box 3083, New York.

TO OWNERS OF REBELLIOUS ORES.

Persons interested in mines of rebelious ore, or having on hand any ore that is not satisfactorily worked, yielding less than it assays, will do well to notice the following offer. The undersigned is in possession of a new secret process which he is willing to try on any ores sent to him. If a pound or more of ore is forwarded to his address, he will test it with his process, and acquaint the owner with the results and the cost per ton for working. Address,
S. P. BRESSLER, Elkhardt, Indiana.

HAND PRINTING PRESS WANTED.—Parties having a second hand Washington or other hand printing press which they wish to dispose of, will please address this office stating price, size and condition.

CAUTION
To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,
North Bloomfield, Nevada Co., Cal., October 1st, 1878.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

DEWEY & CO.,
Publishers, No. 202 Sansome street, San Francisco.

BELTING AND LACING.

MANUFACTURED BY

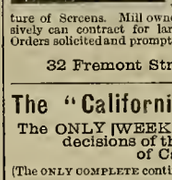
H. ROYER,

Nos. 855, 857, 859 & 861 Bryant Street, Cor. Park Avenue

SAN FRANCISCO.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,



Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

The "California Legal Record."

The ONLY WEEKLY containing all the decisions of the Supreme Court of California.

(The ONLY COMPLETE continuation of the S. F. *Law Journal.*)

Published every Saturday, in 8 vo. size—like the California Reports—contains EVERY DECISION of the Supreme Court, as fast as rendered, with a syllabus and statement of facts, and other important legal matter. The volumes commence on the first of October and April each, and have a full index for reference and binding.

REDUCED PRICE, only $5.50 per year, or $3 per volume of six months. Remit by Postal Order or Registered Letter, specifying what date or number to commence. Back numbers furnished. Sample numbers sent free. Address,
F. A. SCOFIELD & CO., Publishers and Prop'a,
No. 603 Washington street, San Francisco, Cal.

507 Mechanical Movements.

Every mechanic Should have a copy of Brown's 507 Mechanical Movements, illustrated and described. Inventors, model makers and amateur mechanics and students, will find the work valuable far beyond its cost. Sold by DEWEY & Co., Pateut Agents and publishers of MINING AND SCIENTIFIC PRESS, San Francisco. Price, $1, (post paid.

110, 112, 114, 118 & 120 Battery St.,
SAN FRANCISCO.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the hights of the principal mountains. The bounaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

Continued from page 293.

prospect thoroughly. The Eureka Lake Co. are extending the Weaver ditch down on top of the ridge to a point opposite Woolsey's Flat. The object of the extension is to supply the Boston mine with water. The Boston has 45 men employed. The foreman of the mine is Mr. James Redington. In the Blue Banks there are 15 men employed; foreman, Mr. John B. Erb. The Illinois Co. is through for the season.

PLACER.

THE MOUNTAINS YET REMAIN. — *Herald*, Nov. 2: As it is well known to practical men, gold-producing gravel extends in helts through the higher hills of the mountains, along what is termed the ancient channels of streams and rivers. Twenty years ago, the beds of ravines, canyons and rivers, which cut through these ancient belts were rich in the production of gold. The adventurous miners rushed to the harvest. Mining companies sprang up on every side, as if by magic. There was no lack of population. But times have changed. Men, who had made their fortunes, went down to the valleys and cities, nearer the coast, to invest their treasures; hut, the hills and mountains yet remain. Those people who continued here, have been compelled to prospect in the hills and dig tunnels into the mountains. Their energy and enterprise have been rewarded in hundreds of locations. The treasures of the Golden State have not at all been nnearthed. Damascus, Iowa Hill, Sunny South, Bath, Michigan Blnff, and other places, present a permanent continuance of wealth and prosperity. Probahly there is now no better mining section in the State, than that between the north and middle forks of American river.

PLUMAS.

SALE OF MINING PROPERTY.—*National*, Nov. 2: The North Fork Co. has sold all its mining property near the Big Meadows, to Frank Miller, of Sacramento. The sum mentioned in the deed is over $60,000. We are told that this sale will end the litigation and trouhle that has interfered with work in that quarter lately, and that operations will now he resumed and proceed regularly and smoothly as in the days gone by. The property is certainly very valuable and if properly managed, will be one of the most profitable mines in the State.

SAN LUIS OBISPO.

CHROME IRON AGAIN.—San Luis Ohispo *Tribune*, Oct. 26: The chrome business is constantly developing along the coast of our county from one end to the other. There is an almost daily increase in the quantity that is being delivered at the depot in this city. At Cayucos a large dump ie being made, and as soon as the trade will warrant, improvements will he made at the wharf to facilitate the shipment of the ore. At San Simeon, we helieve, regular shipments are heing made. The eupply seems to he inexhaustihle, and the large area of country that has heen prospected and found to contaiu good bodies of ore, gives assurance that a heavy trade can be maintained for many years to come. The only anxiety that our chrome miners need to feel is in regard to the market. Some have started in with very limited capital, and were, no doubt, willing to fill contracts at a very slight advance on the cost of the ore when delivered. It costs something to open a mine, to fit up roads and put things into running order; and to meet the uecessary expenses the owners must realize upon their first products. This, of course, is preferable to lying idle, hut it is desirahle to do better, if possihle. The miners should organize; the society should choose a capable and trustworthy agent from among their number aud send him to Europe, to the chrome manufacturing centers, with instructions to make an exhaustive inquiry into the subject. The expenses of such an agent could he paid by a general assessment upon the memhers of the society, and in this way would hardly be felt. It is probahle that the results would amply repay the projectors. The magnitude of the husiness demands that something of this kind ehould be done; it is in the power of those interested to do it, and the effort should he made.

Our Washoe summary failed to reach us in time for this issue.

Fire-Engine for Bodie.

The citizens of Bodie have been anxious for some time for the safety of their town. Their water supply is not large, and even if water were plenty they have had no adequate arrangements for protecting their huildings from fire. The matter has lately heen hrought forcibly hefore the people by the *Standard*, and as a result in part, no douht of this, decided action has at last heen taken. The course pursued has been the wisest possible, as experience in other similarly circumstanced towns goes to prove. Unwilliug to trust their town to water engines, either hand or steam, the Bodie Fire Department have purchased a chemical engine, of the Babcock patent. The engiue is known as a No. 3 Babcock. Its capacity is 120 gallons; its weight, 2,200 pounds. It is provided with 200 feet of hose. The price of au engine of this kind is $2,250, but Messrs. Park and Lacey, of 417 Market street, San Francisco, from whom the machine was purchased, made the Bodieites a present of $250, so that the mining town pays only 2,000. Enginee of this kind have made good records, and Bodie can now enjoy a new sense of security.

The Chemical Section.

The foHowing is a brief ahstract of the last two meetings of the chemical section of the California Academy of Sciences. At the regular meeting, held on the last Friday in September, Dr. G. F. Becker presented a brief outline of a paper of his, shortly to appear in *Silliman's Journal of Science* upon the determination of the error caused hy the presence of air in exact weighings for the determination of atomic weights. Pres. John Le Conte presented the facts with several possihle explanations of a curious phenonenon which occurred during the battle of Gaines' mill, in the late rebellion. The sounds of the heavy firing of the battle were inaudible on the opposite side of the river, at a comparatively short distance. Mr. August Harding explained a number of interesting arrangements of laboratory and lecture-room apparatus of his own invention. Prof. Rising presented a numher of interesting notes as to recent progress in chemical science. The last meeting was held in October.

President Rising occupied the chair, and the following members were preseut: Prof. John Le Conte, Prof. Joseph Le Conte, Prof. Hilgard, Dr. Becker, Messrs. Christy, Jackson, Booth, Harding, and Stillman.

Prof. Joseph Le Conte made an interesting communication on the functions of the liver in disposing of the waste tissues. He stated that his theory of the glycogenic function of the liver (published in the *American Journal of Science* early in this year) had drawn forth an objection from a prominent physiologist to the point he brought forward of the functions of the liver in dispersing of waste tissue. He had been, therefore, hronght to consider the subject more carefully, and had been still more convinced of the truth of his position.

The ordinary view of disposal of waste tissues is that the combustion of them takes place in the blood, in the part of the tissue when they are first decomposed, because the change from red to venous blood takee place in the tissues.

Prof. Le Conte, however, believes that the waste tissue is carried hy the hlood to the liver and is there separated into liver-sugar and urea, or some substance which rapidly changes into urea. Experiments made hy Schiff support this theory by proving that venous hlood is soon fatal to animals if the liver is tied, but is not so if the liver is free to act, the poisoning being due to decomposed tissues in the blood. Comhustion takes place in the capillaries of the tissues under the influence of venoue force, as the hlood remains for a longer time in the capillaries of the tissue than in any other organ. The blood acts as a reservoir not only of oxygen but of food, and if waste, the food taken in today is not used to build up tissue to-day, but is taken into circulation in the blood and the hlood forms tissue and regenerates itself from this supply of food, so tissue wasted to-day is carried by the blood to the liver, there decomposed into sugar snd urea, and so eliminated perhaps the day after or even longer.

Mr. Edward Booth gave an account of some experiments in England, regarding a peculiar property of filter paper of "fixing" certain metallic salts from their solutions, and of a method hased hased on this of detecting cadmium in the presence of copper in dilute solutions, and exhihited several series of tests which he had made to confirm the method.

J. M. Stillman presented an investigation on the ethyl ethers of glycerine, conducted hy him in Europe, involving a new method of ohtaining the mono-ethyl and di-ethyl ethers, and the more accurate determining of their hoiling points.

S. B. Christy exhihited some pieces of iron which he had coated with magnetic oxide hy heating in an atmosphere of steam in an iron tube, the coating being quite thick and coherent. This coating is interesting, as heing the same that Prof. Barth has found so useful in preserving iron against rust.

J. M. Stillman called attention to a method hy Prof. H. W. Vogel, of detecting the poisonous carhonic oxide in the air of rooms, etc., hy the peculiar spectrum which blood gives when containing even traces of this gas. By this means he could detect four-tenths of one per cent. in the air of certain rooms in Berlin. Prof. Jno. LeConte mentioned some experiments iu Belgium when powdered chemieale, as carhonate of lime, had been reduced hy immense pressure to hard and translucent hlocks.

A. W. Jackson stated that Prof. Sandberger had detected small traces of the precious metale in the common igneous rocks, which may throw light on the methods of ore deposits.

Prof. Rising mentioned some experiments by Beche in Italy, on the occurrence of horacic acid in the fumaroles he ohtained hy the action of steam at high temperature, from the serpentine rock of the country, horacic acid, sulphureted hydrogen and ammonia.

The meeting then adjourned.

PACIFIC PAINT MINING COMPANY.—This company has heen incorporated, with a capital of $100,000, for the exploration of a mine in Los Angeles county containing a natural deposit of paint of various colors.

WE call attention to the business card of Merchant & Alban, Mining Agents, 411½ California street, room 9, over the room formerly occupied by the San Francisco Board of Brokers.

THE Arctic whaling fleet had, on Sept. 1st, ahout 5,500 barrels of oil and 1,800 pounds of bone.

California Academy of Sciences.

A regular meeting of this society took place on Monday evening. Dr. Harkness presiding.

The following contrihutions to the cabinet were acknowledged: Thirty specimens of fossils and casts from Armagh, Ireland, and seven shells from the Wenlock Series, Silurian, Wren's Nest, Dudley, England, hy Dr. Harkness. A large number of bottles of fish and reptiles, from J. Gerstler and William Lockington. Numerous specimens of minerals from different parts of the State, by Dr. Emory Willard and Chas. D. Gibbs. The receipt of a large number of pamphlets, donated to the library, was also acknowledged.

A paper was read by A. W. Jackson, Mineralogist of the State University, on "The Microscope in Geology." Mr. Jackson explained the difference hetween a mineral and a rock or stone, and gave the three classes into which rocks have been divided, viz: The clastic or fragmental, the crystalline, and the amorphous. The formation of clastic rock is well known. Certain crystalline rocks have heretofore been considered homogeneous, and it is but recently that geologists have discovered their error. In view of this and other misapprehensions, is it strange that many wild theories have been maintained by geologiste. It is only by the observation of the component parts of rocks that their construction becomes known, and it is in this examination that the microscope comes into use. No method of investigatiou has met with such success as that in which the microscope is used. Chemistry has in many cases failed to give us a clear conception of the construction of rock, whereas the microscope has proved a perfect success. The existcnce of numerous cavities in rocks has long been known, but it is only recently and by the aid of the microscope that the multitude of these minute liquid cavities bas been made known. Each of these cavities in certain species of rock contains minute dancing hubhles. It is interesting to think when one looks at an immense hill of granite that it contaius innumerable minute sparkling dancing bubbles. What idea can we form as to the cause of the existence of these liquid cavities aud bubbles. At the time of the formation of these rocks there must have existed enormous quantities of water, great heat must have existed, aud the bubbles must have heen formed in the liquid cells by contraction. Perhaps in no department of geology does there exist so vast a difference of opinion as upon the subject of the formation of the rocks. Under these circumstances the microscope has heen found to be an important adjunct in the past, and the results of its use will probably be still more important in the future.

J. P. Moore delivered a brief address upon "The Relation of Fungi to Diseases." Mr. Moore stated in the course of his remarks that the existence of fungi many times resulted in death, and as to their minuteness they were floating in the air everywhere. The cause of salmon disease was the existence of fungi. The speaker said that the recent epidemic among house flies was caused hy fungi. The disease first appeared in the form of white stripes of fungoid growth npon the ahdomen of the fly, ard in hut ehort time the victim would succumh. The disease could he spread among fish hy simply feeding them with the dead flies. Mr. Moore claimed that the existence of fungi was not a concomitant of hut a cause of disease. He said that the fungi first appeared in floccillations around the articulations of the ahdomen, and increased in eize daily. The speaker then cited several diseases which were caused by fungi, hut which were not fatal, among which were ring worm, harber'e itch, etc.

Dr. Behr next addressed the Academy upon the same subject as the previous speaker, with whom he agreed in all the particulars of the subject,

Rev. Dr. Bleasdale, of Australia, then cited an instance which occurred in Australia, in which he set forth that measles were often caused hy persons sleeping on damp and mildewed straw.

"THE HOME DOCTOR."—This is the title of a hook presented to us hy the author, Dr. George M. Bourne, of San Francisco. It is a hook for the people, and purports to be a guide to health and for the home treatment of diseases. It is gotten up in neat etyle, with large, clear print, showing that the Doctor, while guiding his readers to health, does not intend to he guilty of injuring their eyes. The Doctor is an iconoclast among doctore generally, and among water-cure doctors in particular. Of the merits of his system the public can hest judge hy trying it. It certainly has this merit, that the trying of it can injure no one. Moreover, it is based, in general theory, npon simple, commonsense principles. The Doctor prefers keeping health to restoring it, and helieves that the physician should be called in to direct the habits of every day life oftener than to administer medicines for cure after laws have heen hroken. He helieves in the spreading of medical knowledge among the people, and to this end the hook in hand has been puhlished. In pursuance of this ohject the work is free from technical terme and states ite simple cures in equally eimple language. Without attempting to even outline the contents of this well-filled hook, we will merely mention that at the present moment what the Doctor has to eay of glanders, diphtheria and yellow fever will prove of special interest.

News in Brief.

GREECE'S new ministers have resigned.

THE short-time movement is spreading in Lancashires mills.

THE strike of the Baltimore oyster-shuckers is injuring the trade.

HAYES congratulates King Alfonzo on his escape from assassination.

IT is stated that France is becoming the diplomatic champion of Greece.

THIS year's yield of honey in San Diego county, may go over 1,000,000 pounds.

MOROCCO is passing through the triple ordeal of oholera, small-pox and malignant fevers.

RAILWAY companies in English cotton districts are discharging hands and reducing wages.

UNLIMITED issues of paper money in Japan are beginning to worry all who wish that country well.

THE German government proposes to increase the duty on wine, hides, grain and some other articles.

THE Portuguese have granted 50,000 acres of uncultivated laud in Mozambique for trying opium culture.

PLATES for printing $5,000 and $10,000 greenhack notes will be ready by the day fixed for resnmption,

IT is asserted that Afghanistan is required to reply to England's ultimatum by Nov. 20th, or the British forces will invade.

A YOUNG wood-chopper living near Auburn, Placer county, has hecn arrested for counterfeiting the legal tender silver dollar.

WM. D. CAMPBELL and John Spurgeon are suing the Spring Valley M. and I. Co. of Cherokee, Butte county, for $20,000 damages sustained by the plaintiffs through tailings being run upon their growing grain.

AORICULTURAL laborers in Kent and Sussex, have struck because of reduced wagee and threaten to emigrate to the Colonies.

JOSEPH U. CRAWFORD, an experienced railroad engineer, has received an important appointment from the Japanese government.

ABOUT six per cent. of the looms and spindlee in the Lancashire and Cheshire cotton districts, England, have stopped or are workiug on short time.

ON Oct. 31st, the German-American National Bank, Washington, suspended, leading to the closing of the German-American Savings Bank. The latter is pronounced sound.

A SPECIAL Board cousisting of merchants, manufacturers, fiuanciers and others, will probahly be established in Germany, to advice the government in mercantile matters.

A LIEUTENANT-GENERAL of the Mexican army has heen found guilty of violating neutrality laws in pursuing a band of revolutionists into the territory of the United States.

THE capital of the Oldham cotton mille is £4,600,000, more than half of which is borrowed. For the last year only ahout one-quarter of this has returned any interest.

BOULDER county, Colorado, farmers will try to stop the importation of dairy produce from Kansas. They should, for it is said that their own land can yield what ie wanted in that line.

BLACK wolves are making havoc among stock on the Platte, on the Panee and Forke of the Crow. Bad as a grasshopper plague a Colorado paper says, and calls for a bounty on wolf scalps.

IT is estimated that the balance sheet of the Paris exposition will show a deficit of 11,300,000 francs. This will be far more than made up by the increase in revenues resulting from the fair.

A CONVENTION has heen ratified between the United States and all the nations of Europe, except Great Britian, together with most of the Sonth American Repuhlics, providing for the establishment and maintenance at Paris of an International Bureau of Weights and Measures.

New Incorporations.

The following companies have filed certificates of incorporation:

NORTH NOONDAY M. Co.—Nov. 5th. Location: Mono county. Capital, $6,000,000. Directors—W. M. Stewart, P. Vanclief, W. F. Herrin, Frank Vernon and C. A. Burgess.

HERCULES M. Co.—Nov. 5th. Location: Amador county. Capital, $6,000,000. Directors—F. A. Benjamin, Gustavus Holland, Humphrey Rees, G. F. Tharp and S. Heydenfeldt.

WALES CON. G. AND S. M. Co.—Location: Eureka county, Nevada. Capital, $10,000,000. Directors—M. Redding, John H. Carmany, H. C. Patridge, J. Henry Applegate, Jr. and Grif. J. Griffith.

BELLEFONTAINE M. Co.—Location: Sierra county. Capital, $5,000,000. Directors—S. P. Warren, F. R. Wetmore, W. T. Perkins, Wm. Milroy and R. B. Milroy.

WESTERN M. Co.—Location: Arizona. Capital, $10,000,000. Directors—A. K. P. Harman, G. B McAneny, W. E. Dean, John H. Boalt and J. F. Boyd.

KENTON M. Co.—Location: Sierra county. Capital, $5,000,000. Directors—S. P, Warren, Wm. Milroy, R. B. Milroy, Charles T. Behan and A. Malpas.

LOWER CROWN POINT M. Co.—Capital, $10,000,000. Directors—John Sedwick, C. L. Weller, H. S. Stone, G. L. Murdoch, Geo. Seckle.

NORTH SIGOURNEY T. AND M. Co.—Location: Bodie district. Capital, $10,000,000. Directors—J. C. Wade, A. F. Main, J. C. Shain, F. W. Utter and John H. Daley.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THIS MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

FOR THE WEEK ENDING OCTOBER 22D, 1878.

DREDGING MACHINES—Geo. W. Cummings, S. F.
ORE STAMPS—Zaccheus L. Kay, San Diego, Cal.
EGG BEATERS—Wm. H. Wiester, S. F.
BENCH PLANES—Patrick Gallagher, Eureka, Nev.
COUGH REMEDIES—Trademark—James D. Culp & Co., S. F.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

"Trademarks."

Recent United States patents for the following trademarks were secured through DEWEY & CO.'s MINING AND SCIENTIFIC PRESS PATENT AGENCY:

H. E. BOTHIN, 21 Stevenson St., S. F., "Mrs. Mills' Cream Yeast Powder"—Yeast Powder.

KRYGERS, RASMUSSEN & CO, Gold Run, Cal., "Pacific Crystal"—Starch for food.

A. S. HALLIDIE, 6 California St., S. F., "Pacific Wire"—Manufactured Wire in the coil.

MORE, REYNOLDS & CO., 212 California St., S. F., "M. R. & Co."—Whisky.

WHITTIER, FULLER & CO., cor. Front & Pine Sts., S. F., "Pioneer White Lead"—White Lead.

A. P. HOTALING, 429 Jackson St., S. F., "St. George" and "Dragon"—Whisky.

J. A. FOLGER & CO., 104 California St., S. F., "Limonium"—Lemonade Powders.

H. C. SHAW PLOW CO., Stockton, Cal., "R 8"—Plows.

RODGERS, ALLERTON & CO., 733 Market St., S. F., "Allekton"—Chemical Solution for Preserving Dead Bodies.

G. N. MILCO, Stockton, Cal., "Buffnell"—Insect Powder.

CHAS. R. BURRAGE, 1645 Mission St., S. F., "California Root Tea"—Medicinal Preparation.

ALICE C. SIMPSON, Danville, Cal., "Mrs. Simpson's Australian Cough Remedy."

B. GREENEBAUM, 22 Sansome St., S. F., "California"—Clothing.

ABRAMS & CARROLL, 3 and 5 Front St., S. F., "Royal Portable"—Lemonade

M. EHRMAN & CO., 217 Front St., S. F., "Evening Light"—Coal Oil.

J. E. MILES, 412 Clay St., S. F., "Alcyone" Coal Oil.

BURNELL & SIMPKINS, cor. 9th Ave. and G. St., South S. F., "Albion"—Malt Liquors.

JNO. PRUSSO, Oakland, Cal., "A Female Figure, seated, with scales and Sword"—Coffee and Spices.

CAL. CIGAR BOX CO., Berry, bet. 3d and 4th Sts., S. F., "Forest King"—Cigars.

FLETCHER & MCCOY, 23 Stevenson St., S. F., "Imperishable"—Paint.

A. E. MINTIE, 722 Montgomery St., S. F., "Dr. Mintie's Vegetable Nephreticum"—Medicinal Preparation.

WM. G. BADGER, 7 Sansome St., S. F., "Hercules"—Clothing.

M. PALEN, San Bernardino, Cal., "Havaboric"—Medicinal Preparation.

CHANNING WHITE, S. F., "Prairie Flower."

YATES & CO., 113 Front St., S. F., "Banner"—Oils; "Starlight"—Oils.

LEBES BROS. & CO., 207 and 209 Sacramento St., S. F., "Cribbage Brand"—Cigars.

J. A. FOLGER & CO., 104 California St., S. F., "Golden Gate"—Teas.

CHAS R. BURRAGE, 1645 Mission St., S. F., "Tartine"—Bread Raising Preparation.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

General Robert Allen Silver Mining Company.

—Location of principal place of business, San Francisco, California. Location of works, Pinal County, Arizona.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 29th day of October, 1878, an assessment of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the second day of December, A. D., 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the second day of January, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

M. C. SOUTHARD, Sec'y.

Office, No. 411½ California street, Room 11, San Francisco, California.

Land Purchasers' Association.—Location

of principal place of business, San Francisco, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1878, an assessment of four ($4) dollars per share (being a part of the 43d installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at No. 641 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Monday, the fourth (4th) day of January, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

C. S. WRIGHT, Sec'y.

No. 641 Sacramento St., San Francisco, Cal.

Mineral Fork Mining and Smelting Com

pany.—Location of principal place of business, San Francisco, California. Location of works: Big Cottonwood District, Salt Lake County, Utah Territory.

Notice is hereby given, that at a meeting of the Directors held on the 31st day of October, 1878, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 20, Safe Deposit Building, No. 328 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventh day of December, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Saturday, the 14th day of December, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

OTTO METCHKE, Sec'y.

Office, Room 20, Safe Deposit Building, No. 328 Montgomery street, San Francisco, Cal.

Mount Jefferson Milling and Mining Co

—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1878, an assessment (No. 5) of five (5c.) cents per share was levied upon capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 315 Pine St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fifth (25th) day of November, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the seventeenth (17th) day of December, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine St., San Francisco Cal.

New Basel Con. Gravel Mining Company.

—Location of principal place of business, San Francisco, California. Location of works: Placer County, Cal.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 4) levied on the 24th day of September 1878, the several amounts set opposite the names of the respective shareholders, as follows:

JAS. W. BAKER, Sec'y.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same ple, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous invention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

CERTIFICATE OF PARTNERSHIP.

The undersigned, having formed a partnership to carry on the business of General Publishers under the firm name and style of Dewey & Co., Publishers, this certifies that the principal place of business of said partnership is situated at 202 Sansome street, in the city of San Francisco, State of California; and that Alfred T. Dewey, residing in the city of Oakland, State of California, and Warren B. Ewer, residing in the city of San Francisco, State of California, are all the members of said partnership.

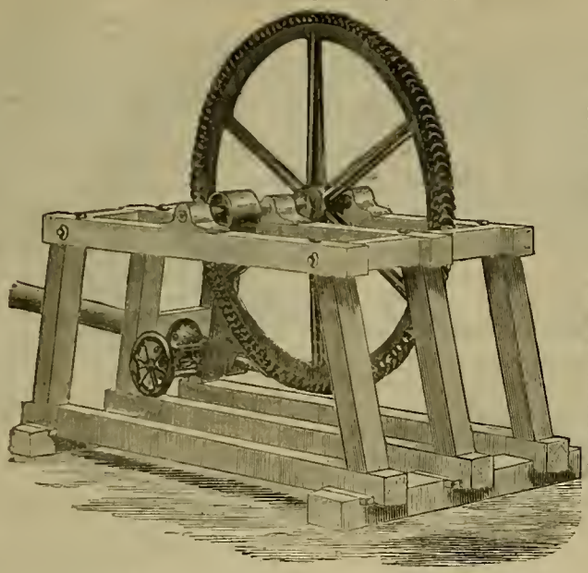
Knight's Water Wheel,

Patented January 12th, 1875.

This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.



This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.

The KNIGHT WHEEL is used in the following named Mills and Hoisting Works, to which the Public are referred:

1-Eight-foot wheel, running Oneida Co.'s Mill, Amador county, Cal.; 60 stamps. Robt Robinson, Supt.
1-Eight-foot wheel, running Con. Amador Mining Co.'s Mill, Amador county, Cal.; 40 stamps and two Hepburn pans. David Davis, Supt.
1-Eight-foot wheel, running Lincoln Gold Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
1-Eight-foot wheel, running pump at same company's mine. S. D. R. Stewart, Supt.
1-Eight-foot wheel, running Keystone Con Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
2-Four and one-half foot wheels, used in hoisting by reversible water power at same company's mine. O. C. Hewitt, Supt.
1-Four and one-half foot wheel, running Original Co.'s Mill, Amador county, Cal.; 40 stamps, one pan, one rock-breaker. J. R. Johns, Supt.
1-Four-foot wheel, running Gover Mining Co.'s new Mill, Amador county, Cal.; 20 stamps.
1-Eight-foot wheel, running same company's old Mill; ten stamps. John Palmer, Supt.
1-Six-foot wheel, running Talisman Mining Co.'s Mill, Amador county, Cal.; ten stamps.
1-Eight-foot wheel, hoisting and driving pump at same company's mine. John Tregloan, Supt.
1-Four and one-half foot wheel, running Bunker Hill Mining Co.'s Mill, Amador county, Cal.; ten stamps. John Palmer, Supt.
1-Four and one-half foot wheel, running Gold Mountain Mining Co.'s Mill, Amador county, Cal.; ten stamps. J. C. Goodman, Supt.
1-Six-foot wheel, running St. Patrick's Mill, Newcastle, Placer county, Cal.; 15 stamps. Jno Townsend, Supt.
1-Eight-foot wheel, hoisting and running pump, compressor and hoisting at Sheba Silver Mining Co.'s Mine, State of Nevada.
1-Four and one-half foot wheel, running Luck Q. M. Co.'s Mill; ten stamps, Oregon.
1-Four and one-half foot wheel, running Republic Mill; 20 stamps, Nevada county, Cal. E. H. Dyer, Supt.
1-Six-foot wheel, at the Plumas Eureka, running 48 stamps, two pans, two rock-breakers. Wm. Johns, Supt.
2-Six-foot wheels, sent up to Sierra Buttes Mines, one to run 50 stamps and the other to run pans.
1-Six and 2 Four and one-half foot wheels, sent to Sauls burg Mine, Sonora, Tuolumne Co. J. Leechman, Supt.

KNIGHT & CO.,
Sutter Creek, Amador County, Cal.

Elephant Ore Stamp.

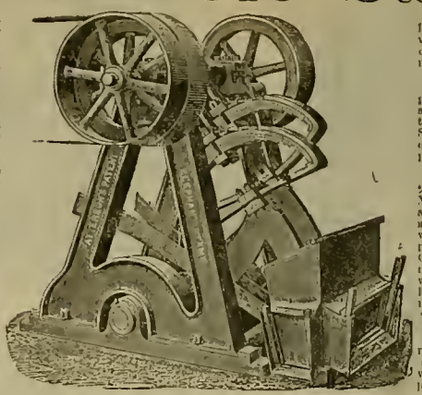
We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1¼ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.



The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco For particulars, apply to

EDMUND WHITE, Care of A. B. Grogan, 705 Sansome St.

EDISON'S ELECTRIC PEN and PRESS.

MAKES 5,000 COPIES FROM ONE WRITING.

Requires no Prepared Ink, or Paper, no Skilled Expert to do Good Work From 5 to 15 Copies per minute by an Office Boy.

Mining and Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the largest west of the Mississippi), are constantly increasing. These facilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

REGISTER YOUR

TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

A GOLD MEDAL

Has been awarded at the Paris Exhibition of 1878 to

CLARK'S

O. N. T.

Best SIX CORD SPOOL COTTON. It is celebrated for being STRONG, ELASTIC and of UNIFORM STRENGTH. It has been awarded MEDALS at the great Expositions, from the first at Paris, in 1855, to the Centennial at Philadelphia in 1876. In this country CLARK'S O. N. T. SPOOL COTTON is widely known in all sections for its Superior Excellence in Machine and Hand Sewing. Their Mills at Newark, N. J., and Paisley, Scotland, are the largest and most complete in the world. The entire process of manufacture is conducted under the most complete and careful supervision, and they claim for their American production at least an equal merit to that produced in Paisley Mills. As

NO GRAND PRIZES were awarded at Paris for SPOOL Cotton,

They are glad to announce to the American Public that they have been awarded a GOLD MEDAL, being the highest award given for Six-Cord Spool Cotton.

Artesian Wells.—No. 6.

Improved Tools.

In the last article, rough cuts and descriptions showing the general character of well-boring tools were given. To-day we give cuts of improved apparatus. All the tools represented are patented, and the cuts of the same copyrighted by Charles D. Pierce, manager of the Pierce Well Excavater Company, No. 4206, Elm Avenue, Philadelphia, Pa.

Figs. 1 and 3, represent two views of a 17-inch auger. The shells or pods are made of quarter-inch iron-plate. The lower portion of these pods, after forming the cup-like curve, are shod with knives or cutters, which are inclined in two directions, so that when the auger is revolved they will engage the earth at the inner corners first, and cut down gradually with a draw-cut. The outside points stand farther than any other portion from the center of the apparatus, as is indicated by the dotted circles. Thus so small a portion of the auger touches the side of the bore-hole, that there is a minimum of friction. Moreover free access of the air to the space beneath the auger, is allowed so that when the latter is drawn up no suction will interfere. Other devices have been tried to overcome this suction; the edge of the shell has been turned over, forming an air-tube; pipes have been used; the side of the shell has been flattened;—but with no flattering success, as the air passages so formed are soon filled with debris. The dots on the edge of the pods show where sand-sides and valves may be attached, thus converting the auger into a pump. These attachments are necessary in boring in quicksand. When great distances must be sunk through quicksand, a curb is put in, and the boring continued through this. The cutters are of three-eighth inch steel, and so fastened with rivets that they may be removed and new ones substituted. The shells are attached to cast-steel arms, which are hinged so that when the auger is drawn up full, and the collars or hauds (shown in cuts) slipped up, the shells swing open, and the debris falls out. It is said that this auger will bore through anything except solid, hard rock.

Fig. 5 represents an 18-inch auger, the construction of which can be gathered from the cut. Fig. 4 shows the same, with the sand-sides and valves attached. In both cuts the marginal dotted lines indicate the size of the borehole, no part of the tool but the outer points of the cutters being allowed to touch the sides of the hole. The key, B, Fig. 4, can be removed so that the shells may be spread, either to discharge debris, or to admit of the entrance of rocks nearly the size of the borehole. The valves, Fig. 4, are hinged about E, the dark dotted lines showing them closed, the lighter lines indicating their position when open. The position of their axis is shown by the dotted diameter, in the horizontal projection, below Fig. 4. The valves may be lifted up, for discharging purposes, by means of the rod F, Fig. 4. Only one valve need be lifted, and hence but one of these rods is necessary.

Fig. 2 shows one of these excavators, as worked by horse-power. By means of hook-wrenches men may revolve the rods and do the boring. A, B, show clay-pipes; C is a wooden-pipe; these are of little value where pressure has to be exerted in forcing the tube. Iron is generally used, as explained in a previous article. D is an extra shaft. Eight revolutions fill the auger. It is drawn up and emptied every two feet. The man at the crank feeds the auger and raises it when filled. In boring hard material the auger must be pressed down by some weight on the rods. When men are boring some of them frequently sit on the wrenches while others turn.

Improved Sand Auger.

Some kinds of sand, gravel and quicksand, will not slide up into any kind of an auger over a foot deep, unless there is something to stir the sand and elevate it. Fig. 6 represents an improvement intended to manage such material. This auger has a spiral elevating core, an air passage down the center of the core, C (an inch in diameter), which prevents suction. The core is revolved and allowed to drop below the cylinder, A, far enough to fill. The cylinder does not revolve with the auger. When the auger-worm is full, it is drawn up into the cylinder, and the sand, slush or gravel, is held by the cylinder and leather flaps or valves, E E, when all is drawn up together. The contents are discharged by sliding the cylinder up two feet. D is an adjustable set-screw and ring to regulate the sliding cylinder, A. The cylinder can be removed for clay boring.

None of these tools are adapted to boring in hard, solid rock. When this is encountered and must be bored through, other tools are needed, as indicated in previous articles. In our next we will consider improved apparatus for *drilling* wells.

THE Commissioner of the General Land Office recommends that the Sierra Nevada M. Co. be advised to institute proceedings against the Union Con. M. Co., to test the validity of the latters patent.

Death of Henry Sumner Smith.

Henry Sumner Smith, Vice-President of the Mechanics' Institute, and one of the proprietors of the Ætna Iron Works, in this city, died at his residence on Tuesday last. Mr. Smith has resided in this city since 1856, and has been identified with the iron working interests during all this time. He was well and favorably known in the community as a genial, upright man and one who well deserved the success attending his business efforts during late years. He was a first-class mechanic, and was universally respected by all with whom he came in contact. A special meeting of the Mechanics' Institute was held on Tuesday evening, Irving M. Scott, President, in the chair, to take suitable action in reference to the death of Mr. Smith. The President said that deceased was one of the most active and honorable members of the Institute and the mechanical profession. No member had given more patient and conscientious labor to promote the interests of the Institute. He had endeared himself to every one who knew him, and was above reproach in his business and private relations. It was fitting that the Institute should take proper steps to honor the memory of the distinguished member.

Mr. Hallidie gave a short sketch of the life of deceased. He was born in Rutland, Vermont, August 23d, 1832, and served as an apprentice in a machine shop. He came to California in May, 1856, and soon after joined the Mechanics' Institute; was employed in the Vulcan Works, and was sent to Oroville to superintend the erection of a quartz mill. After six years service in the Vulcan foundry, he served as foreman in the Pacific and Golden Gate foundries, and in April, 1866, formed a partnership with Hanson & Pendergast, in the Ætna foundry. He was for four years a member of the Tax-payers' Convention, and in 1876 was nominated by them for the Assembly. In 1875 he was elected a trustee of the Institute, and re-elected in 1877. In August last he was elected Vice-President, to fill the vacancy created by the resignation of James Duffy. His experience was of the greatest value in making the Industrial Exhibitions successful. He was a man of quick perception and careful judgment, and enjoyed the fullest respect and confidence of his fellow-workmen and fellow-men.

On motion, the Chairman appointed A. S. Hallidie, H. S. Wheeler and W. H. Birch a Committee on Resolutions, who reported the following:

WHEREAS, We are called together for the purpose of giving some expression of sentiment and feeling on the occasion of the unlooked-for and unexpected death of the Vice-President of this society, Henry Sumner Smith, it is by the members of the Mechanics' Institute, in public meeting assembled,

Resolved, That by the untimely death of Henry S. Smith, the Mechanics' Institute of San Francisco has lost one of its most valued and efficient members and painstaking and faithful officers, whose active and intelligent efforts have always tended to the advancement of this association and the best interests of the mechanics of this city.

Resolved, That his death leaves a void in the social circle that cannot easily be filled, and the silence of his voice and association of his ready offices in every place where his services were needed, will be felt in this community and long mourned by his friends.

Resolved, That in this hour of their affliction, and in view of their irreparable loss, the members of his family have our most sincere sympathy.

Resolved, That this Association show its respect for its late Vice-President by attending the funeral, under the direction of a committee of six, three of whom shall be from the Board of Trustees, and three from the members at large.

The resolutions were adopted, and the committee was appointed, as follows: For the Board of Trustees—S. H. Wheeler, D. A. McDonald, Samuel Dinsmore. For the members at large—W. H. Birch, Chas. R. Steiger, C. F. Bassett.

The funeral will take place Sunday afternoon, under Masonic auspices. Deceased was a Past Master of California Lodge, F. and A. M., and President of the Past Master's Association, and otherwise of high degree in the Order.

The members of the Mechanics' Institute will assemble at one o'clock, at the Library building, on Post street, to attend the funeral in a body. The building will be closed on Sunday, except for the purpose of assembling the members.

THE Hayes M. Co. are having good work done on one of their mines, near Santa Maria creek, in Yavapai county, Arizona. Their deepest shaft is down about 50 feet, vein about four feet wide.

DURING the month of October, 2,251,141 pounds of silver-lead bullion and 3,457,452 pounds of silver ore were shipped over the Utah Southern road.

THE Flood and Kirkpatrick mines in Oro Blanco district, Arizona, have been sold to a company in Philadelphia for $75,000 and the money paid.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Lixiviation versus Amalgamation.

EDITORS PRESS:—In your impression of Oct. 26th I observe an extract from an article I contributed a short time since to the *Arizona Citizen* on the above subject. I now send you the concluding portion of it, which may possibly suggest the reason why lixiviation has not hitherto proved a success in Utah, Nevada and California.

"The only precaution to be observed is to have the works erected and conducted under the supervision of a competent, experienced metallurgical chemist, who is capable of modifying the process to suit the particular ores with which he may have to deal, and whose actual experience is such as to enable him to grapple with and overcome any unexpected obstacles which may present themselves in the constituents of the minerals. Serious blunders (involving heavy pecuniary losses and frequently total failure with entire loss of capital invested) being the almost inevitable results of intrusting these costly works to the management of mechanical engineers, miners and others, who, however well qualified in other respects, have not the chemical knowledge and experience which are indespensable in order to insure certain and successful results from what is essentially a chemical operation."

Not having been in the places you mention during the last few years (except for a short visit to Inyo county last year), I am unable to explain the causes of their failure, but am strongly inclined to attribute them to neglect of the precautions I have suggested. On the other hand, I have observed notices of its success in Utah, from time to time in your journal, as well as a very interesting account of the process in your impression of July 7th of this year, as conducted at the works at Baranca in the Province of Sonora, Mexico, under the supervision of Mr. N. Graff, an accomplished metallurgical chemist (formerly assayer to the Gould & Curry Co.), where it has proved a most undoubted success; as well as at the establishment of Mr. R. Johnson, Mina Prieto, near Hermosilla, where (again under the management of another first-class chemist, Mr. Platry) it is working $25 ore to good profit.

The success of the process has also been triumpbantly demonstrated in Colorado, where there are now seven or eight large establishments in steady operation, some of them combining the Hunt & Douglass copper process with the extraction of silver.

It has also been carried on with marked success at Swansea, Wales, and in Germany, during the last 30 years; so that its success, when properly conducted, is no longer a matter for argument; and I am firmly convinced that when a class of men shall have been educated to work the process as it should be, it is destined to supersede amalgamation to a great extent in Nevada, Utah and California—as it is already doing in Mexico. W. T. RICKARD, F. C. S.

Tueson, A. T.

Lixiviation in Utah.

The following is from the Salt Lake *Herald*:

The old Telegraph leaching works on the Jordan are running very successfully, on ores from the Old Telegraph and Jordan mines. About 700 tons per week is the amount being leached. The ore concentrated after leaching, for the remaining lead and silver, and by this means there is very little loss. The cost for leaching and concentrating amounts to less than $1.50 per ton. The sulphides are mixed with slacked lime and the slimes from the concentrator, the whole being put in sacks and melted down with the ores in the smelter. It is the intention to treat the sulphides from the Bingham works in a like manner from this time forward.

MECHANICS' LIENS.—Notice is given by the Supreme Court, in two decisions delivered at Pittsburg recently, that mechanics who file liens against property "for work done and material furnished" must comply exactly with the requirements of the statute if they would have their claims sustained. In one case, the lien "for plasteriug and furnishing materials for plastering two dwelling houses as per contract," was declared fatally defective because the claim did not set forth the kind and amount of material furnished, and the time when the materials were furnished and the work done. In the other case, the lien set forth that the materials were furnished for the "erection and construction" of the buildings, whereas the evidence showed that they were for the *repair* of the buildings, and it was therefore disallowed. This is getting the law down to very fine points, but mechanics are warned by the decision that to make their liens good they must be very exact in stating their claims. In one case, at least, the claimant has no opportunity to file a new and amended claim, the limited time for that having already expired.

A LATE invention of William H. Armor, of McKeesport, Pa., is an improved vehicle wheel hub. The spokes of the wheels in which this is used may be put into the fellies and the hubs, without cutting the tire.

The Martin White Case.

An Instructive Decision by the Supreme Court of Nevada.

This decision, rendered a few weeks ago, is so replete with interest to mining men, and involves so many open questions, that rather than run the risk of losing any of it by garbling condensation, we shall publish it in full. It is too long for one issue, and will be continued in several.

General Statement of the Case.

This is an action to determine the right of possession of certain mining ground in the Ward district, White Pine county. The plaintiff deraigns title from the location of a claim called the Shark, and the defendant is the grantee of the location of the Paymaster. Both claims were located on the same ledge—the Paymaster in July, the Shark in September—and the principal question in the case is as to the validity of the Paymaster location.

The facts in regard to this location are very clearly and fully presented by the findings of the District Judge, which embrace the special verdict of a jury upon a number of issues submitted to its decision. No exception whatever is taken by either party to the findings of the jury, and the objections of the appellant to the additional findings of the Court relate rather to the conclusions of law involved than to the facts upon which they are based.

The question before us is therefore narrowed down to a construction of the legislation of Congress and the local rules of the Ward district governing the location of mining claims.

Before entering upon a discussion of the purely legal questions involved in the case, however, it will be best to give a connected statement of the facts, which are as follows:

Organization of Ward District.

Mineral deposits were first discovered in what is now the Ward mining district by Thomas F. Ward, in March, 1872. On the 1st of May the district was organized, a set of local rules adopted and (it seems) Ward appointed Recorder. The rules so first adopted were, in their general features, like the rules everywhere prevalent on this coast before the enactment of the law of Congress of May 10th, 1872. Claims were to be located by posting a notice at the point of discovery, the notice to be recorded in 15 days; this to hold the claim good for 100 days, within which time a certain amount of work was to be done on the ground in order to hold the claim a year. Each locator was to have 50 feet of the surface on each side of his ledge or vein, but this not to carry the right to any mineral deposit therein distinct from the one located. These rules, so far as they were not inconsistent with the act of Congress of May 10th, 1872, continued in force until the 1st of October following, when the miners adopted a new set of rules.

Discovery and Location of the Paymaster.

Such being the law of the district for the location and holding of claims, Ward, on the 17th of July, 1872, discovered the vein or ledge which is now in controversy, and placed upon the croppings at the discovery point the following notice:

Paymaster location notice,—"We, the undersigned, do hereby locate and claim fifteen hundred (1,500) feet on this ledge lode, or deposit of mineral-bearing quartz or rock, with all its dips, spurs, angles and variations, together with all privilcges prescribed by the mining laws of the United States and this district, and intend to hold and work the same according. We claim three hundred (300) feet easterly, and twelve hundred (1,200) feet westerly from this monument, running along the course of the vein. This shall be known as the Paymaster.

"Ward Mining District, July 17th, 1872, situated about 1,500 feet northwest by north, from Mountain Pride lode."

To this notice were appended the names of the locators, and opposite the name of each was set the number of feet (undivided) to which he was to be entitled.

Changes in the Record and Location Notice.

On the following day, July 18th, the claim was recorded by Ward, as Mining Recorder of the district, by copying it into a small memorandum book which he carried in his pocket, and which at that time constituted the record book of the district. Subsequently, about the first of August, a larger book was obtained, and the records transcribed from the little book. In the meantime, however, the Paymaster notice, and the record of it, had been changed as follows: It seems that there was some sort of an agreement subsisting between Ward, John Henry, E. C. Hardy and three others, that they should be equally interested in the locations made by Ward. But in the location of the Paymaster, Ward had omitted Hardy's name, and inserted that of Dave Pearson, who was not a member of the company. A few days after the location and recording of the claim, Henry called Ward's attention to the fact that Pearson's name was improperly on the notice, and Hardy's name improperly omitted. He also objected to the unequal distribution of the claim among the six locators. Ward thereupon changed the notice on the ground, and the record in the little book, by erasing the name of Pearson and substituting the name of Hardy, and by changing the figures following the names, so as to give to each locator 250 feet of the claim. These changes in the notice and in the little book were made before the transcription to the large book which, since the 1st of August, 1872, has contained the records of the Ward district.

Further Developments.—Work Performed.

Subsequent developments have shown that the vein or ledge upon which this Paymaster claim was located has a course or strike from southeast to northwest. According to the magnetic meridian (variation 16½°) it runs more nearly east and west.

In September, 1872, some work—it does not appear how much—had been done on the Paymaster location, but the course of the vein was not clearly determined.

A Conflicting Location.—The Shark.

Such being the condition of that claim, on the 9th of September the locators of the Shark discovered the croppings of the same vein at a point about 400 feet northwest of the location point of the Paymaster, and posted to following notice:

"Shark mine, No. 1. Notice: We, the undersigned, do hereby locate and claim fifteen hundred (1,500) feet on this ledge, lode or deposit of mineral-bearing quartz and rock, with all its dips, spurs, angles and variations, together with all privileges prescribed by the mining laws of the United States and this district, and intend to hold and work the same according. We claim 750 feet on each side of the monument running along the course of the vein. This shall be known as the Shark mine, No. 1.

"Ward mining district, Nye county, Nevada, September 9th, 1872.

"JOHN TAYLOR, 375 feet.
"THOMAS CONNOR, 375 feet.
"MATHEW GLEESON, 375 feet.
"CHAS. STRUTENBERGER, 375 feet."

On the following day this notice was recorded, the certificate to the record being as follows:

"Recorded September 10th, 1872, at 10 o'clock A. M. Situated about 600 feet northeasterly from Young American mine, and about 300 feet northwesterly from Paymaster mine.

"THOS. F. WARD, Recorder."

Ward Allows it Recorded.

Some significance is attributed to the fact that Ward, the locator of the Paymaster, going upon the ground for the purpose of making this record, and necessarily observing the proximity of the Shark to the Paymaster, made no complaint at the time that the Shark locators were on his claim. It was not until October, and after some work had been done by the locators of the Shark, that notice was given that they were on the Paymaster vein. They, however, denied that it was the same vein. They claimed a cross vein, and declared that if it turned out that they were on the Paymaster they would give it up.

Change in the Paymaster's Notice and Record.

About this time—on October 10th, 1872—John Henry, one of the Paymaster locators, took down their notice and put up another, the same in all respects as the one removed except that it claimed 300 feet southerly and 1,200 feet northerly from the monument, instead of 300 feet easterly and 1,200 feet westerly. On the same day he drove down two stakes, one at the northwest end of the Paymaster and the other at the southeast end. They were marked "Northwesterly stake of Paymaster" and "Southeasterly stake of Paymaster." These stakes were on a line, or very nearly on a line, with the croppings of the vein as now developed, and within a few feet of the center line of the claim as now surveyed. At some time subsequent to the change of the notice on the mine, a corresponding change was made in the record of the claim by erasing the words easterly and westerly and inserting the words southerly and northerly. The jury could not find who made this change in the record, but the District Judge was of the opinion, and so are we, that it was done by Ward and Henry, but without any fraudulent intent.

The Laws of the District Altered.

In the meantime, on the 1st of October, the laws of the district had been changed so as to conform more nearly to the act of Congress of May 10th, 1872, it being especially provided that locators should have 300 feet of surface ground on each side of their vein, to include, of course, not only the vein originally located but all veins within the surface lines. (R. S., Sec. 2322.)

The Paymaster Location Held to be Valid.

It is found as a fact that sufficient work has been done under each of these locations to satisfy the requirements of the law of Congress and the rules of the district. The Paymaster location was never marked upon the ground in any other way than by the three stakes on the line of the croppings—one at each end and one at the point of discovery—until it was surveyed for the purpose of the patent application in October, 1875. The Shark location was never marked on the ground in any way, except by the monument at its initial point, until April, 1874, when Gleeson set stakes at the four corners of the surface claim. On these facts the District Judge concluded that the Paymaster location was valid, and, as a consequence, that the subsequent location of the Shark on the same ground was invalid. In accordance with this conclusion the judgment of the District Court was for the defendant.

[To be Continued.]

A NOVEL soldering iron, the invention of M. Paquelin, was recently described before the Academy of Sciences, Paris. Its distinctive feature is a platinum receptacle, in which heat is instantaneously generated with air and petroleum vapor or air and coal gas.

Volcanic Eruptions in the South Seas.

We have received the particulars appended respecting this singular phenomenon from Mr. Consul Layard, Noumea. The accuracy of the account is vouched for by a Swede named Peterson, resident on Tanna, who was an eye-witness to the events narrated: The eruption occurred on the 10th of January last about 10 A. M. The bottom of the harbor at the west side rose above water for about 50 fathoms in length at the first earthquake shock. A new volcano burst out close to Sulphur bay, between it and the old volcano. The west side of Port Resolution is all bursting up with steam at this moment. A second great eruption and earthquake happened on the 11th of February, and the bottom of the harbor was again upheaved for about another 50 fathoms, making the entrance to the harbor very narrow. Three rocks rose up about a cable's length from the west point to seaward out of 11 fathoms of water. There is now a bar with only 15 feet of water where there used to be five or five and a half fathoms right across the mouth of the harbor, a little inside. A tidal wave, about 50 feet high, swept the east point of the harbor, destroying all the native plantations. My cobra house was swept away. The wave occurred on both occasions, but the first was the largest. Every one, including myself, lives on the hill tops, so no lives were lost. My vessel, the *Suengone*, was driven right up among the trees, but carried out again. I lost both my anchors and all my boats. I have come here without either. It is wonderful how she was saved. As we came out I saw a patch of discolored water about two miles due north from the port. I did not examine it, but am sure it is a new shoal. It extends, perhaps, a cable's length. I left Tanna on the 27th of March. We had strong winds and variable, very hot, with rain, at times before the eruption. The old mountain was very active also, roaring and throwing up huge rocks. The tidal wave was very local; so was the shock. The missionary on the other side of the island hardly felt it, and there was no wave there. A high hill behind the rock called Cook's pyramid, on the west of the harbor, fell into the sea, and has made a new point of land; and Cook's pyramid is some 40 feet higher out of the water than it was. We had several small shocks all the time between the two big ones, also after the last big one. The natives say they never knew anything like it before. On the west side the earth has cracked and sunk very considerably; on the east side the land was swept by the tidal wave; the plantations on both sides are destroyed. It will not affect the natives much; they began to plant again immediately. The wave did not destroy the trees. The whole harbor is so contracted by the upheaval that I doubt if a large ship could find room to swing in. The bottom in the place I have named has been raised 15 or 20 feet, or more, above the water in some places along the shore. Two days before the first shock the old mountain was very active, roaring loudly. The fish were violently affected; seemed paralyzed, and unable to swim. Numbers were left on the beach—so many that the natives and the pigs could not consume them, and they rotted as they lay.—*The Colonies and India.*

Americans Ahead of Europeans.

"A good copy is better than a poor original," says the proverb. What, however, shall be said of a Continental firm which buys locks or takes samples made in New Haven, United States, and exhibits them in the Austro-Hungarian Department of the Paris exposition?

Let us examine them:

1. On the hasp and key of one are the figures "23," the private number of that particular padlock, made by Mallory, Wheeler & Co., of New Haven, Conn.

2. The stamp "2 tumblers" has been so far removed from the varnished face of the padlock that it can only be seen by glancing at it in the light so as to present a certain angle. It is doubtless one of a set of samples on which the inscription, "2 tumblers," has been put with white lead, which has been removed by turpentine, but left an impression on the asphaltum varnished.

3. Another padlock has "3 in." yet visible; and a third has "in.," "20," both of the Mallory, Wheeler & Co.'s marks.

If made in Austro-Hungary, they would hardly have inscriptions in English.

4. The scutcheon of the keyhole has been ground down thin in removing the stamp of the firm.

I can only account for the substitution of American locks on one of two suppositions:

1. They could not make any so good.

2. The name of the company—Eisenwarenindustrie und Handels-actiengesellschaft, Moravia in Olmuz—was too long to go on such locks.

The American juror in this class, No. 43, Prof. William P. Blake, detected the fraud and had the award of a medal canceled.—*E. H. Knight, in Scientific American.*

A NEW substitute for modeling clay is coming into use. It consists of 51.2% of fatty acids and fats, 5.2% of oxide of zinc, 30.2% of sulphur, and 13.4% of clay. A successful imitation is made up as follows: 300 parts of fatty acid (from olive oil) boiled with 43 parts of oxide of zinc, and 130 parts of olive oil and 60 parts of wax melted together with it. Into this molten mixture incorporate 250 parts of sulphur and 118 parts of clay.

MECHANICAL PROGRESS.

Progress in the Manufacture of Steel.

M. Marche took a rapid historic survey of the manufacture of steel, obtained at first by cementation, then by puddling, followed by the more perfect Bessemer apparatus, and lastly, when the Siemens apparatus allowed the necessary degree of temperature to be obtained, by direct melting of the iron on the sole of the Martin furnace and those derived from it. In passing briefly over this part of his subject, M Marche merely indicated to his hearers the design of the various apparatus mentioned and the method of their employment. He then stated at greater length the various points which distinguish the modern method of manufacture from the ancient, showing how important a part is played by chemistry at the present time. In the old metallurgical works the head founder and the head puddler directed operations; now this direction belongs in an absolute manner to the laboratory. In a steel works everything is now done with mechanical precision. Each of the elements contained in the material worked is exactly proportioned, not only at the commencement and in the final product, but through all its successive stages. It is determined where they are to concentrate themselves, and by what method they are to eliminate themselves at each step in the manufacture. Nothing is left, as formerly, to the skill of a workman, who, destitute of scientific knowledge, worked by routine or by empirical rules, of a more or less rational character.

In like manner, in order to ascertain the quality of the metal obtained, they are no longer content with rough tests, where all was left to the judgment of the workman in charge, but special machines are used which indicate with precision its resistance, elasticity, breaking tension, etc., and which render possible the expression of different qualities by exact figures. These testing machines are now used in all factories and works where steel is made or used.

Thanks to these tests, we are able to give a scale which makes known the corresponding qualities for each composition of metal. Without seeking to make distinctions which could not be defined with precision, the metal is more often designated in the market by its physical qualities—resistance, elasticity, proportionate tension before breaking.

The exact knowledge of these elements admits of the careful choice of the most suitable metal for each purpose as, for instance, railways, wheel-tires, axles, boilers, etc.

As to the cost of manufacture, that of steel has already considerably fallen; it approaches very near to that of iron, and everything tends to show that it will soon not only reach that level, but will even fall below it. The manufacture of steel, indeed, as far as regards labor, is less costly than that of iron; the amount of loss is not so great, and if the price has remained higher, it is because it has hitherto required the use of ores and raw material of greater purity; but already several metallurgists have succeeded in replacing these special ores, which have been brought from Algeria, Elba, Sardinia, etc., by others which are more common, and there can be no doubt that when, as must soon be the case, these ordinary ores are universally employed in the manufacture of steel, this metal will add to all the advantages already experienced, that of being less costly than iron.—*Exchange.*

Improved Revolving Roller Anti-friction Bearing.

The following we clip from an English exchange. The use of revolving rollers for bearings has not hitherto proved very successful, but Mr. John Robinson, of Sheffield, has invented some improvements which he believes will remove the difficulties which have been encountered. In the construction of a bearing for ordinary purposes he provides several rollers of equal lengths and diameters, and each having an annular groove or neck, turned or otherwise, formed at a short distance from each end; he then prepares two circular frames the internal diameter of which slightly exceeds the diameter of the shaft to which the bearing is to be applied. Each frame consists of four semi-circular plates or pieces, forming when put together two washers or complete circles, one washer having slots corresponding in size to the necks of the rollers and opening to the outside, and the other washer having similar slots opening to the inside, thus when the two washers are put together and the slots opposite each other, the solid parts of the washers close up the entrance of the slots, leaving circular holes at equal distances round the washer, thus keeping the rollers equidistant. The four parts of the frames are secured by screws or other suitable means. For some purposes he prefers to turn a single groove in the middle of the rollers, and in that case only uses one frame, and in the case of long bearings he may use the two end frames and a center one combined. According to another modification, he simply uses solid circular washer-shaped frames with the slots, having rounded ends opening to the outside into which the necks of the rollers are dropped. The rollers in all cases are of larger diameter than the width of the frame, and, therefore, project beyond the inside and the outside of the frames, so that the shafting revolves on the rollers clear of the frame, and the outer surface of the rollers revolve and bear on the pedestal, or other bearing frame, causing the entire frame and rollers to revolve. Thus the entire frame with the rollers revolves round its own axis as well as each roller revolving round its own separate axis. By constructing the frames in parts in the manner herein described, facility is afforded for applying the rollers to sink necks and positions otherwise inaccessible. The number of rollers, as also their lengths and diameters, may be varied according to circumstances. They may be composed of any suitable material, but he employs by preference hardened steel for the purpose.

NOVEL COMPRESSED AIR MOTOR.—A novel arrangement of compressed air motor applicable to tramway cars has been invented by Mr. V. J. Fallart, of Brussels, which consists chiefly in a peculiarly constructed apparatus of spiral construction, in conjunction with other mechanical parts. When applying his system to a tramway car he mounts this latter on a framework so constructed and articulated at its four corners as to be able to turn freely in any direction, and although the said car can be of any other shape he prefers making it with two compartments disposed one above the other, with a spiral flight of steps conducting to the top one. On the above-mentioned frame he fixes severally a reservoir for gas, an air compressor in the form of a coiled pipe, and the so-called spiral apparatus. To set the carriage in motion he opens the gas valve, which admits the gas into a cavity formed under a piston placed in an air chamber. This gas is ignited at this spot by means of a lamp, or otherwise, and the piston working in the said chamber compresses the air, which is conducted into the reervoir or coiled pipe. From there the driver of the tramway car, by means of appropriate gearing, valves, rods, or other mechanical equivalents, conducts it into what he calls the spiral apparatus, consisting of a pair of cylinders enclosed in a circular envelope, working directly on, and thereby imparting motion to the driving shaft, which is put into communication with the carriage wheels by means of an endless chain passing over pulleys mounted on the shafts of said wheels. In order to turn easily on curves he has another wheel mounted so as to turn freely on each shaft, and an indicating needle placed on the platform serves to indicate the direction of the line of rails beneath, so that the driver, by means of an appropriate lever, is enabled to direct the car in any direction.

"SOFT CENTER" STEEL.—The *Revue Industrielle* describes what it calls a new composition of iron and steel as follows: "A cast-iron mold is divided into two sections by means of a transverse plate of thin sheet iron. The two metals are then poured into the respective compartments. The sheet-iron partition prevents the mixing of the metals and facilitates the welding by itself being brought into a state of fusion. It is said that the product is well adapted for safes, and that it resits drills." In view of the fact that this process is the subject of an American patent now some years old, and that it has been used for years in Pittsburg and other places in the manufacture of what is known as "soft center" steel, it is rather late in the day to call it a new process. The description given is hardly correct, however, as plate iron is used instead of sheet iron. In the practice at Pittsburg several pieces of iron are sometimes used, making several alternate layers of iron and steel. For use in manufacturing safes the outside layer is iron. For plows there are three layers, generally two of steel and one of iron. The character of the center, that is, whether it shall be "hard" or "soft," of steel or iron, depends largely upon the use to which it is to be put. Where the use demands hardness on the outside for protection against wearing or abrasion, and at the same time considerable toughness in the center, as in plows, the center is soft or of iron. For ease of welding and toughness with rigidity, hard center or steel center is used.—*Iron Age.*

A NEW STREET CAR MOTOR.—A new steam street car motor, built by Messrs. Porter, Bell & Co., the well-known locomotive builders of this city, says the *American Manufacturer*, has just been put for trial on the extension of the Citizens' Passenger Railway Company between the cemetery and Sharpsburg. We had the pleasure of a ride upon it the other day, and, so far as we are able to judge, it is a complete success. The new motor is separate from the car, and is attached to the latter by a link. It may be run either forward or backward. The chief feature of this motor which distinguishes it from other street car motors is the horizontal tubular boiler. This insures durability in the tubes, the lack of which has been one of the chief objections to the vertical boiler. It is provided with Shaw's patent exhaust nozzle, which makes the exhaust noiseless. With the ordinary car attached it may be started, stopped, run over rough places in the track or on curves with the same facility as the car drawn by horses, and a much greater speed. It is claimed that it will travel on any of the street car grades up to 350 feet in the mile. We do not see any reason why it or some equally good steam motor should not be the street car motor of the future. The horse car is a barbarism, unworthy of the age.

GEORGE F. PALMER, of Rochester, N. H., has invented a hose nozzle by which the quantity of water discharged may be easily regulated without changing nozzles, and without in the least checking the free passage of the water.

SCIENTIFIC PROGRESS.

Le Conte's Theory of Mountain Formation.

Dr. Joseph Le Conte, in his Elements of Geology, lately published, gives a very complete theory of mountain formation, based upon the supposition that the earth is substantially solid.

The earth is regarded as made up of concentric isothermal shells, each cooling by conduction to the next outer, and the outermost by radiation into space. For a long time the outermost would cool fastest. But a time would come when the outermost would become of a nearly fixed temperature, receiving heat from external and internal sources, while the interior would still continue to cool by conduction. The interior, because cooling faster, and also because the amount of contraction for equal cooling is greater at high than a low temperature, would contract faster than the exterior. The interior would tend therefore to shrink away from the exterior, which, following it down, would be subjected to powerful horizontal pressure, and must finally yield somewhere. *Mountain-chains are the lines along which the yielding of the surface to horizontal thrust has taken place.* This yielding is not by upbending into an arch, leaving a hollow space beneath, nor yet into such an arch, filled and supported by an interior liquid, as usually supposed; but by mashing or crushing together horizontally, like dough or plastic clay, with foldings of the strata, and an upswelling and thickening of the whole squeezed mass.

The theory here presented accounts for all the principal facts associated in mountain-chains. This is the true test of its general truth. It explains satisfactorily the following facts: 1. The most usual position of mountain-chains on the borders of continents. 2. When there are several ranges belonging to one system, these have been formed successively coastward. 3. Mountain-chains are masses of immensely thick sediments. 4. The strata of which mountain-chains are composed, are strongly folded, and, where the materials are suitable, are affected with slaty cleavage; both the folds and the cleavage being usually parallel to the chain. 5. The strata of mountain-chains are usually affected with metamorphism, which is great in proportion to the hight of the chain and the complexity of the foldings. 6. Great fissure-eruptions and volcanoes are usually associated with mountain-chains. 7. Many other minor phenomena, such as fissures, slips, and earthquakes, it equally accounts for.

A New Anthracite.

At the recent meeting of the American Institute of Mining Engineers, the President, Eckley B. Coxe, presented, says the *Coal Trade Journal*, specimens of a peculiar variety of anthracite. It has a dull, greasy appearance, as if an ordinary piece of anthracite had been rubbed with a greasy rag and allowed to dry. It was formerly considered a very impure coal, containing a high percentage of ash, and was picked out of the coal and thrown away; but the following analysis by Prof. J. Blodgett Britton, of Philadelphia, shows that it is quite as good a fuel as ordinary anthracite.

Water	4.36
Volatile combustible matter	3.48
Ash	7.26
Fixed carbon (by difference)	84.90
Total	100.00

The carbon is to some extent in the nature of graphite and slowly combustible. The following is an analysis of the ash:

Silica	25.66
Alumina	27.08
Ferric oxide	42.83
Lime	1.56
Magnesia	1.83
Manganous oxide	.11
Sulphur	.17
Phosphoric acid	.21
Alkali, undetermined matter and loss	.69
Total	100.00

GAS CLOTH.—This is a name given by Dr. Hirzel, of Leipzic, to a gas and water-tight stuff, which he has produced by placing a piece of so-called gutta-percha paper between two pieces of some not too coarse and dense material—shirting (undressed)—and then passing the arrangement between heated rollers. It may be made still denser and more resistant by being coated on both sides with copal lac. It can be applied to all those purposes for which water-proof material is used, and is well adapted to form gas-tight membranes for regulators of pressure of compressed gas, bags or sacks for dry gas-meters, as also dry gas reservoirs.

NEW PROCESS FOR TESTING AIR. — Prof. Wanklyn and W. J. Cooper have brought before the Sanitary Institute of England their new process for testing air. A strongly alkaline solution of permanganate of potash is prepared, the strength of which is determined accurately. They allow a known volume of this solution to act on a known volume of air heated nearly to the temperature of boiling water. After allowing the solution to act on the air they again determine the strength; the lose of strength represents the amount of oxygen consumed by a known volume of air. The purer the air the less the consumption of oxygen.—*Iron Age.*

Steam as a Light Reflector.

As everything pertaining to the improvement of the methods and paraphernalia of illumination is at the present time looked upon with special interest, we reproduce, for the benefit of our readers, an account of a recent patent granted in Germany to Herr L. Brandau, of Berlin, in which he proposes to utilize the emissive properties of steam for illuminating purposes. In describing his plan, the patentee refers to the fact that steam in condensing forms dense white vapors, which possess the property, when exposed to an intense source of light, of partly reflecting and partly absorbing and subsequently emitting it, as the clouds behave toward the sunlight, diffusing a mild and uniform brightness. In adapting his system to overhead and side lights, Herr Brandau employs an apparatus consisting essentially of a glass chamber, into which steam is admitted, a passage way for its exit being also provided. This is then either illuminated directly, or with the aid of mirrors, by the source of light.

Novel as it may seem, the plan appears to us to have decided merit, and it is not impossible that the idea of Herr Brandau may contain in it the elements necessary for the successful moderation and diffusion of the blinding brilliancy of the electric light, which has in most situations proved to be a serious drawback to its usefulness.

The high absorptive and emissive properties of water vapors, both for heat and light, are well-known physical facts; and the commonplace allusion to the sudden gleam of brightness that follows the escape of clouds of steam, especially noticeable when the sunlight is hidden, will serve as a familiar example of a principle that Herr Brandau proposes to turn to useful account.—*Engineering and Mining Journal.*

REFORMS IN COAL WASHING.—Under this head P. Barnes, in the *Iron Age*, explains some of the reasons why the importance of coal washing has not been more generally recognized. He says that it is almost impossible to convince many consumers that the ash-making or other impurities, or any considerable quantity of them, have ever been washed out of coal, or can ever be. This is due in part to the fact that the literature of the process—that is, the clearly-recognized results—is so scanty that but few persons realize its simplicity or the experience of others in it. Others cannot believe that the washed product can be obtained at reasonable prices. This is because many who have tried the process have often been either unable or unwilling to go to the expense of putting up respectable apparatus and making a fair trial. They have patched up a rig which has proved a failure and led to their condemning the whole project. He closes as follows: As soon, however, as a few coal-washing establishments have been really constructed (and not merely fixed up and tacked together in the cheapest way to "experiment" with) so that they can be continuously run and driven hard, even with the race of workmen who know no other tools than a pinch bar and a sledge hammer, coal washing will begin to look up, and some confidence will be felt in its utility to the general consumer, and not solely to the maker of high grades of pig iron. If, also, it be true that coal and iron lie in a complete and an important sense at the foundation of a great part of our manufacturing interests, and if the price of coal to-day is so important a factor, as it is said to be, in the ability of our works to continue in operation, it cannot be a judicious policy to ignore or to neglect any important method of promoting their real improvement, either in quality or in price.

THE ELECTRIC LIGHT SCARE.—The English correspondent of the *Iron Age* writes from London, under date of October 14th, as follows: The electric light *furore* here is almost incredible; in fact it threatens to become a sort of second railroad mania. Already three new "limited" companies have been formed to work it. The *Ironmonger* gives lists of the contributors, from which I learn that two have each a capital of £100,000 and the other £5,000. Mr. E. J. Reed is "in" at one. The panic in gas shares is not merely marked, it is ridiculous. Poor clergymen, maiden ladies and other innocent investors have become frightened and are throwing their good property (gas shares) away at any price the enterprising "bears" of the Stock Exchange think fit to fix. Edison's alleged discovery of the divisibility of the light came like a bombshell into the gas camp. Shares fell here in two days to the extent of 27%.

THE HAYDEN EXPEDITION.—A letter from Washington, Oct. 18th, says: A letter was received by the Secretary of the Interior to-day from Professor Hayden, reporting his arrival at Cheyenne on the 14th instant, and giving news of the safety of those portions of the survey expedition that are still in the field. He says that, with the exception of some mules stolen from the Wilson detachment, no losses have occurred to the survey during the summer. He reports that "the work of the survey, though interrupted from time to time by storms, has gone on steadily," and that two tons of specimens are on their way from Bozeman.

Mining Share Market.

Two hundred and sixty-six men have been discharged from the California and Con. Virginia mines. Opinions vary as to the cause. Mackey says there has not been work for many of the men for some time. Others hint that they were employed during election time for political purposes. The *Stock Reporter* thinks that they have been engaged on dead-work, which is now finished. Whatever the true cause, the effect on the market has been the most natural supposable, though no very alarming crash has resulted.

Mackey says that the heat in the lower levels is so great that six men can hardly accomplish what one man can on a higher drift. He also says it will hardly pay to take out the ore still remaining in upper levels, on account of the great settling that has taken place. Few of the discharged men will he wanted again soon. But he thinks that work is increasing in other parts of the Comstock, sufficiently to compensate for the decrease in the Bonanza pay rolls.

This event raises the question as to whether it is good policy to attempt such deep mining, while so many surface deposits are idle in all parts of the coast.

An ominous movement in the market, was the slight rise in Bodie stock on the decline of the Bonanzas.

The Eureka Con. is showing unexpected vitality. The spur-wheel break, it seems, is not to stop dividends, after all.

The lesson of the week is: The Comstock is not the only place in the world where profitable investments can he made.

Bullion Shipments.

Since our last issue, we have noticed the following shipments of bullion:

California.—Bodie, Nov. 4th, $13,427.54; 11th, $12,151.71. Extra, Nov. 5th, $4,188. Pittshurg, Nov. 9th, $3,256; Standard, Nov. 9th, $16,597.12.

Idaho.—Black Jack, $5,822.21. Idlewild, $1,500. Potosi, $1,083.75; $1,300.

Nevada.—Belmont, Nov. 8th, $6,031; total for Oct., $25,046. Independence, Nov. 11th, $12,500. Indian Queen, Nov. 4th, $4,814.24. Manhattan, Nov. 13th, $12,196.92. Navajo, Nov. 11th, $5,300. Northern Belle, Nov. 4th, $2,899.85; total for October, $47,013.74. Raymond & Ely, Nov. 2d, $4,967.28. Stafford, Hamilton, $1,847,02. Star, Cherry Creek, $500. Tyho Con. Oct. 31st, $3.852.85; total for Oct., $64,630.92.

Utah.—Ontario, $5,288.86; Silver Reef, $1,512.32; $5,698.48; $4,843.52.

THE Wellington mine, at Departure bay, shipped 12,000 tons of coal in the month of October.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

PERSEVERANCE REWARDED.—*Ledger*, Nov. 9: For some time Humphrey Reese, the well-known mining expert of Sutter Creek, has been endeavoring to get capitalists interested in the Hercules claim, 1½ miles south of Plymouth. He has at last succeeded. A company has been organized. The work is to he commenced at once. The machinery from the Coney mine, Jackson, has been purchased for use at the Hercules. At the hottom of a 50-foot shaft, is at 10-foot quartz vein.

CENTENNIAL.—The Centennial 20-stamp mill has started up, with flattering prospects. Sinking operations are through with for the present. The shaft is 320 feet deep.

KNIGHT'S FOUNDRY.—This prominent establishment of Suttor Creek, is crowded with work of every description. Among the jobs in progress we may mention 400 feet of 11-inch pipe for the hydraulic claim of Horne and Nevills, at Butte City; also 1,500 feet of pipe for Nevills and Rhodes, to be used on a gravel bank near Butte. A wheel of Knight's patent, 4½ feet in diameter, for Moyle's gravel claim in Volcano Flat is finished. A smaller wheel, 3 feet in diameter, is to he put up on a mine near Murphys, Calaveras county.

ITEMS.—Mannon's creek claim at Sutter is worked out. Fixing up steam hoisting works at the Downs mine, at Volcano, has commenced. R. Stewart is still busily engaged in repairing his quartz mill near Volcano. The Volcano tunnel is in 1,200 feet, leaving 1,000 feet of the hardest rock yet to he gone through. Water is now obtainable in sufficient quantities to run three 8-hour shifts. Mace's mill above Volcano is running on ore from R. Stoken's claim. J. Grieshach's mine, near Mace's, is improving. The ore hody has widened out and rivals in quality the richest taken from the claim in the past. The Montreal gravel claim at French Hill, known as Trueb's claim, was sold hy the Sheriff on Tuesday, to L. Raholt, for $832.24, amount of judgment and costs.

CALAVERAS.

YANKTON MINE.—Calaveras *Citizen*, Nov. 9: This mine is situated about four miles east of Murphys, in the Stauislaus mining district, and is owned hy W. M. Oliver and T. F. Trask. The ore is easily extracted. They have three shafts sunk on the lead, the deepest being only 40 feet. The ore is rich in hoth silver and gold and will average at the lowest estimate $100 to the ton without assorting. The lead averages 20 inches in width. They have about 50 tons of ore on the dump, and are preparing to erect a fine stamp mill. They have a good mill site easy of access. Water can he procured from the Union ditch with which to run the mill, and timher can he procured in abundance and of the very hest quality, within a distance of two or three miles. The claim is 1,500 feet in length and can he traced on the surface nearly the whole distance. The extension has been taken up hy different parties and prospects well. Many are inclined to helieve that a second Bodie will result from the rich discoveries.

GRAVEL MINING REVIVING.—*Chronicle*. Nov. 9: There is not water enough yet for all the claims, hut several hydraulics have hecn put in active operation during the past two weeks. On the Bonanza, Moser & Co., piping has been commenced. Work has also begun at the Mammoth, J. F. Veith owner. The mill at the Duryea gravel mine in Chile gulch is running day and night. The underground force is sufficient to keep the machinery constantly employed. Brown & Co., proprietors of the Burlington tunnel claim, on Tunnel ridge, are crowding work ahead with the best of results. All the hatteries at the Hoey & Sliter claim in Old Woman's gulch are running on gravel that averagee $1 to the carload. G. Raymond, proprietor of the Penneylvania claim, adjoining Hoey & Sliter, is making good progress with his tunnel. Cook & Co. are working their Calaveras hydraulic vigorously. The company own a ditch in connection with the mine, a circumetance that rendere them independent. As the eupply of water increases work will he resumed on other mines.

CHAMPION MILL.—*Chronicle*, Nov. 9: The huilding is a suhstantially huilt edifice 70x40. There are four arastrae so arranged that all can be fed from the hattery which stands in ahout the center of the huilding. The hattery is composed of three etamps, aud is ueed exclusively for hreaking up the quartz prior to its heing fed to the arastras. All the machinery is run hy a mammoth overehot water wheel, measuring 40 feet in diameter. The proprietore of the mine have ahout 800 tons of ore on the dump, a large proportion of which is good for $100 per ton.

ITEMS.—Whitford & Co. lately went to work in the shaft of an abandoned mine on Valentine hill, about a mile from West Point. They had not sunk to exceed six foet when they uncovered a two-foot ledge that experts say will pay $8 per "cargo." Reed & Rohinson, proprietors of the "Buffalo" mine, are doing well. At Glencoe, *nee* Mosquito, the Banner continues to flourish. At the "Rehecca" everything progressee favorably. New machinery is being put on the San Joaquin. The Malone mine, at Rohinson Ferry, is soon to be worked. A new mill is being erected at the Collier mine. It is reported that an extensivo hydraulic claim is soon to be opened at Washington ranch, about three miles above El Dorado. A 16-inch pipe is to be used. The Happy Valley B. G. & H. M. Co will soou be piping on the old Percival claim, and tuuueling to open up the Sport Hill country.

EL DORADO

NEVER SO PROMISING.—*Republican*, Nov. 7: In our mines the outlook has not been so promising, in this county, for yeare as at the present time. In quartz, we have the old Church-Union, that has not failed for years to turn out $10,000 a month, and the Gold Deposit and Utah, just started up, that promises to do even hetter, with several other mines being developed, which give every assurance of success. In gravel we havo several mines that are acknowledged, nniversally, to be rich, and there cannot be the slightest doubt that we have thousands of acres, still untouched, of as rich gravel diggings as have ever yet been developed. Several experienced miners, mcn who havo been engaged in the husiness for years all over the coast, have been prospecting about here for several months and have purchased and bonded a number of mines. The newest in gravel are the Anderson claim, just ahove Smith's Flat, upon which a mill and hoisting works have been erected, and in which a fortune is already in sight, and the Negro Flat, hotter known as the Madden mine. This latter claim has been worked in a small way, for years, and has yielded up many thousands of dollars. This latter claim is in the hands of wealthy parties in St. Louis, and J. W. Whitlach. The present owners paid $15,000 for the property, only three or four acres of which have heen worked, and put on two six-inch giauts, and are working it in a systematic manner. They employ seventeen men, Mr. Whitlach being the Superintendeut, and Peter Watt, foreman.

LOS ANGELES.

SILVERADO. — Los Angeles *Herald:* The Blue Light's concentrator has not yet arrived, although it is said to he on the road. The owners of the Southern Slope are not working their mine at present, their time heing ocoupied in settling up their affairs in the valley. The Thanksgiving is sacking good galena ore. The discoverers of Silverado, and what we might now call the Bonanza Kings, Messrs. Cassidy & Curry, are working their Southern Belle mine to a good advantage by running a tunnel to strike their vein. They expect in a short time to commence working their Santa Clara coal mine. Frank Luce is making good improvements on the Santa Rosa, and is getting out good milling ore. The Santa Ana, Santa Rosa, Southern Belle, Scorpion, Lake & Seares, Florentine, Blue Light and the Flanagan mines are all supposed to he the same ledge. All are extensions north and south of the Southern Belle. Good ore is shown from the Mayflower, Rough and Ready, and many others.

MONO.

SILVER HILL.—Bodie *Standard*, Nov. 6: The Silver Hill tunnel enters Silver hill south of Aurora and at a greater depth. Work has heen steadily prosecuted with three shifts of men since commencement, and will be continued right on through the winter. Another contract will be let in a few days to run 250 feet. The thorough prospecting of Silver hill by this company is of immense advantage in developing the range, and we fully expect to hear of important devolopments ere long.

BLACKHAWK.—East crosscut, 400 level, has been advanced seven feet; total length 41 feet. Another stringer of ore about two inches wide has heen cut. Prospects favorable. West crosscut has been advanced seven feet; total 37 feet. The rock in hoth crosscuts is a little softer. The new shaft is 98 feet deep; progress for week, 13 feet.

DUDLEY.—Work in einking still progressing rapidly and timheriug heing done as fast as depth is attained.

RIQUEZA.—The shaft has attained a depth of 260 feet, a progress of 50 feet during the paet two weeks. A elight flow of water in the hottom. Several stringers of quartz have been passed through. The east crosscut is in 120 feet. A ledge formation of quartz mixed with porphyry 20 feet wide has heen passed through and the face is now in hard porphyry.

ORO.—This property is next the Goodshaw and Concordia mines. The locatiou is a very favorahle one. Work will he commenced at an early date to enlarge the present shaft into a two-compartment and timhered. The directors are Geo. W. Copo, Jules Simon, Edward D. Wright, J. H. Dane and William Stuart, who is also Secretary. The Superintendent is Thos. Steele.

SOUTH BULWER.—Shaft down 182 feet; still sinking. Will continue einking to 250 feet, when crosscutting will he commenced for the vein.

MONDAY.—The company are pushing their new shaft ahead as fast as possible, having put on as many miners as can he worked to advantage. The ledge ie two feet wide and shows gold freely. The shaft is down 25 feet, and has good working ground.

ENTERPRISE.—Thie mine is situated on the easteru slope of Silver hill, on a line with the Bulwer and Belvidere. The shaft ie down 73 feet; progress during the week, 12 feet. At a depth of 50 feet a ledge two feet wide was struck pitching to the west.

NEVADA.—Have let a new contract to sink the shaft down to a depth of 100 feet. This mine has a very favorable location, heing directly south of the Champion.

SUMMIT.—The south drift is in from the shaft 38 feet. The ledge is three feet wide, of good average ore. A drift has been started north, in which the ledge is two feet wide.

DOUBLE STANDARD.—This company are working with a small force, pending preparations for winter quarters. The first 100 feet will be worked with windlass.

RELIEF CON.—The shaft is down a distance of 115 feet and the bottom is now in brown porphyry, having cut through the upper formation.

CALIFORNIA.—Supplies for the winter will be laid in as soon as possible, and work will be actively resumed.

CANDELARIA.—Matters yet are dull on account of expected litigation with some of the properties. The Northern Belle company's mines are looking exceedingly promising. A first-class body of ore has recently beeu opened up in the drift ruuning from shaft to ore body, but matters are not far euough advanced to extract the same. Other locations, such as the Hollins shaft, are being worked, the ono in questiou having struck an ore vein of promise. The Mt. Diablo has also found a good body of ore, and the mine is looking first-rate throughout. Work will soon be commenced on the Potosi mine.

LAKE DISTRICT.—The Mammoth mill started up on the 21st of last month on orcs from the Mammoth and other mines belonging to the company. The property of this incorporation is said to be looking exceedingly well, and explorations go to prove considerable richness and extent. A soft streak of mineral-hearing quartz was struck in the Mammoth which assayed $200 per ton.

NEVADA.

IDAHO.—Grass Valley *Union*, Nov. 7: There are five ore-producing stopes. All the surface works are in prime condition, and the full head of 50 stamps are constantly running. The yield of the mine for four weeks in October was $47,000. The usual monthly dividend of $7.50 per share, amounting to $23,250, was declared on Mouday. This makes the 111th regular monthly dividend, aggregating the magnificent sum of $2,510,500.

CENTENNIAL.—The drifts show a good ledge of pay rock in their whole length. The fine appearanco of the ledge in the north drift gives great satisfaction, as it is in new ground and going toward the old Smith & Crossett ground, which was found very rich many years ago. The other levels and stopes of tho mine present their usual good appearance. The prospects for regular monthly dividends in the future are good.

ALASKA.—At the station of the 4th level (which is now to be opened), a vein of good gold-hearing rock is exposed, which will work to a fine profit. Good ore is found northward to the Bullion ground, and a drift is to be carried through to that ground, by which means both compauies can he served through the new combination shaft.

SWISS-AMERICAN.—Work on this new mine has gone on steadily during tho past month, and the perpendicular shaft has reached a depth of over 90 feet. A whim shaft has heen put down in the old workings to the depth of 50 feet, and a strong 3-foot ledge openod, which prospects in free gold, and makes a fair showing in eulphurets.

ROCKY BAR.—Active work is going on in the different levels of the mine, heing prosecuted hy six or seven trihute companies. About the mine and works between 60 and 70 men are engaged. A recent crushing of tribute rock from the Rocky Bar paid $64 per load, as the highest figure, while another lot yicldod $34.

BEN FRANKLIN is one of the old square claim locations, on Oshorne hill. E. F. Moore & Co., have a lease of the ground. The ledge is 14 inches in width, and shows gold freely. It dips into the claim from adjoiuing ground, and when worked has paid handsomely.

SCADDEN FLAT.—With the continuance of fair weather steam will he started up in from five to six weeks. The mill recently purchased at Brown's Valley, Yuha county, is now being taken down, and will be shipped to this place by rail.

CASSIDY.—This mine, situated on Ophir hill, has recently been purchased by James Bennalleck, and work will soon be started. It has produced good paying rock.

GOLD HILL.—The present depth of the incline is about 460 feet. The ledge is of good size hut of low grade.

NEW YORK HILL.—Tho last crushing of 51 loads paid $100 per ton, and the sulphurets therefrom, 5½ tons, yielded $1,700.

WASHINGTON.—The incline is down 140 fect, and the ledge in the drift from 10 to 18 inches in width. The rock has improved of late and carrics well in good-looking sulphurets. A recent assay of the rock gave $36 per ton in gold and silver.

PACIFIC.—Located on New York hill, and owned hy McDonald & Co., hrings to the surface ore which mills from $150 to $200 per load.

PEABODY.—This claim on Rhode Island ravine, in the vicinity of the Gold Hill mine, is now being worked on tribute. The ledge is 12 inches in width and of a fair grade.

LAFAYETTE No. 2.—Located at the head of Bullion ravine, on Osborn hill. In doing the annual work gold-hearing rock has beeu found, which givee encouragement. The ledge is from 6 to 10 inchee in width.

ONLEANS.—A numher of prospectors are at work on different portions of this property,

Continued on page 316.

True Fissure Veins.

Advance sheets of the third revised edition of Phillips' "Explorers', Miners' and Metallurgists' Companion" have been placed in our hands. From them we extract the following:

"True fissure veins" are always found in metamorphosed (reheated spots of strata), chiefly in the "azoic," less frequently in the "paleozoic," and no good mine has been found in England above the "triassic," or first period of the "mesozoic" or third time; but, in some other parts of the world, antimony, lead, iron, manganese and mercury, in the second and third periods of this "mesozoic" time, when sufficiently metamorphosed in veins, which are, however, not well defined true fissures, but modifications from extensive volcanic upheaval, and consequent sublimations.

1. "True fissure veins" are rarely found unaccompanied by others, and various systems or ages of their fractures can often be observed, as they have slidden at different times upon each other.

2. They do not conform to the cleavage of the stratum, or lie in the intervening division between two distinctly different strata.

3. They do not generally decrease, but rather increase their width and riches, at the greatest depths attained by man, although apparently occasional instances occur of the reverse.

4. Their encasing walls are remarkable for regular definition, smoothness, and unctuous or soap-like clay surfaces.

5. Their constituents of matrices and minerals are always found in laminations more or less conforming to general parallelism with the encasing walls; and, when short diagonal "splices" or "vughs" occur, they are almost invariably in similar planes.

6. The minerals are sometimes found in most distinct individual courses, the one beside the other, or in different parts of the vein's width; at other times, speckled indiscriminately throughout, or in occasional stones of each; whilst, more frequently, they are so intimately mixed that they cannot be separated by hand.

7. Thus, the minerals are associated side by side with entirely different and numerous elements: the permanently insoluble oxide of tin beside the sulphurets of iron, copper, zinc, and sometimes lead; or arseniurets, oxides, carbonates, etc., of the one or the other, some in massive and others in crystalline forms; all of which, I presume, are derived from chlorides or oxides, the oxide of tin alone retaining that insoluble form, whilst the others have passed, or are still passing, into other combinations.

8. "True fissure" veins take independent paths through all of the metamorphosed strata lying in their course or dip. If, however, a stratum of rock overlies those that had been metamorphosed before, the vein *does not* pass out beyond the earlier heated spot, into that since deposited thereon.

9. They partake somewhat of parallelism, for each age of fracture, but take all bearings and dips at their different ages, as governed by the directions of the lines of contraction or subsidence of the age.

10. The veins of the *one parallel*, in the *same* complicated system, will all be richer in minerals of similar kinds, than those that run transversely thereto; not, I think, from any *difference* of *magnetic* influence caused by bearing, but from *age of fracture* alone, and consequently larger space and longer action for better solution and precipitation of the minerals.

11. The magnetic bearings of veins have been greatly influenced by the general contour and directions of the adjoining ridges of the more primitive granite rocks, and vary their degrees of bearing and dip accordingly, and the richer veins generally parallel such influential causes for conformity.

12. However near the systems of veins or districts may lie to each other, certain peculiarly local influences will apply, as particularly displayed in Cornwall, where, commencing, at the St. Just district, near the Land's End of England, the north and south veins have been most productive for copper and tin; at Marazion, those bearing northwest and southeast have been most profitable; whilst, in the center of the county (only about 30 miles inclusive), at Camborne, Redruth, Gwennap and St. Agnes districts, those bearing east and west are alone mineralized. North and south bearing mountains prevail throughout the world, and they as often govern the direction of veins, but profitable veins are found on the slopes and foothills of mountains at all angles of the theodolite.

13. It may be observed that "true fissure" veins seldom dip less than 45° from the horizon, are frequently near to, and sometimes quite vertical; each vein takes independent direction and dip, often passing forward and downward through the others, at all angles within these limits; one may, for instance (as in Fig. 1), dip northerly at 50°, whilst another overlying this may also dip northerly at 60°, and pass down through it; a third may still overlie and dip northerly at 85°, which also, after passing through both, may change its dip from north to south; a fourth dips south through all these at 70°, or any other degree; whilst a fifth may be a "slide," which will also occasionally disorder or shift the lode; the whole being also of somewhat different degrees of direction, and traversed by cross-courses that partake of similar, but transverse differences of the angles of bearing and dip. On this figure, *a* shows a Y intersection; *b*, an inverted Y intersection; *c, c, c*, X intersections; *d*, a "horse" in the vein; *e*, a "carhona;" *f*, a "bonanza," or pocket; *g*, a surface deposit; and *h, h, h, h, h, h*, "feeders."*

14. Some parts of "true fissure" veins, and almost invariably where the dip is more vertical, contain more mineral than others.

15. Certain directions, and corresponding parallelisms, of "true fissure" veins of a district, will always contain more mineral than other directions. * * * * * *

First, let Fig. 2 represent a vertical section of a fissure that had thus changed its dip from that of A to B; and again from C to that of D. A and C are profitable portions of the vein, simply because B and D are *more contracted* and *prevented an equally free passage of the mineral waters*. The arrows represent the *horizontal line of contraction*, that opened the rocks from *original contact* for the *after infiltration* of the matrices and minerals. Now, as the horizontal lines marked by the arrows show the *direction* of the separation of the walls of the vein by

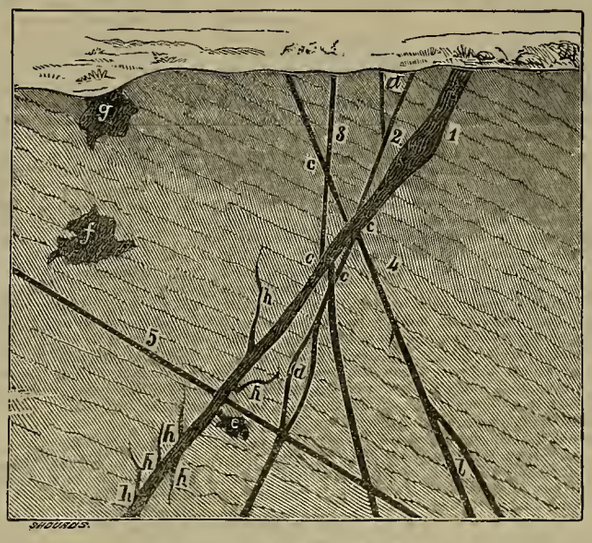

FIG. 1. TRUE FISSURE VEINS.

contraction, so will the corresponding parallel lines at A and B, C and D, measure the *amount* of this contraction through *similar lines* in the vein; whereas, the width of the vein must be measured, in each case, at A and B, as well as at C and D, by *right-angled* lines, to the *separate* and *different dips* of the vein at A and B, C and D.

16. Free passage and much water are regarded as good indications for extensive deposits of the minerals; which also favor these ideas, and that such portions were, and are being, mineralized by infiltration.

17. Lodes often vary in size from other causes than those of direction and dip, as the one wall *actually sliding down* the other, etc.; and the larger places are generally much richer (for the reason of such free passage of water) than other more compact sections.

These frequent expansions or "wallows" of lodes, between irregular walls, that must have been first parallel, may have been also sometimes produced by highly heated water, which would dissolve or hydrate the silicic acid of the silicates of potash and alumina from the adjoining rocks, and thus add to the general solution more of the solvent or matrix, silicic acid, with the alumina or clay, for the joints and walls; whilst the precipitant of potash would also be similarly watered and released from its affinity by this high degree of heat, and provide a natural re-agent for the precipitation of minerals at shallower sections of veins, after the pressure and temperature had become suitable for this change of action.

Organic matter from the surface may have greatly aided these separations and precipitations in the novel manner suggested by the foot note at the end of Chapter X, on mineralized zones or reefs of stratum.

18. Lodes (having also the other necessary conditions) which vary in direction, dip, size, etc., are more plentifully supplied with minerals than those of perfect regularity.

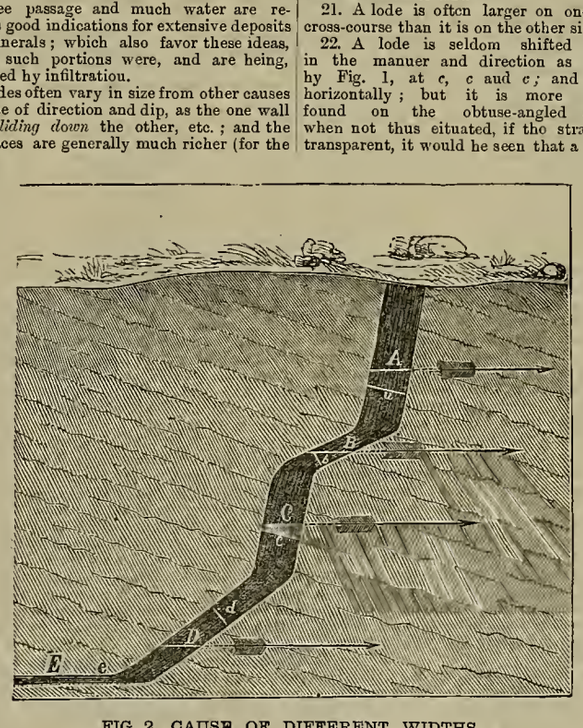

FIG. 2. CAUSE OF DIFFERENT WIDTHS.

19. When mineralized lodes are intersected or crossed in length or depth by "counters," "cross-courses," "slides," or "dikes," they are generally improved at and near their junctions; although sometimes the reverse is the case.

20. A lode is sometimes mineralized on the one side of such intersections, and not mineralized on the other side.

21. A lode is often larger on one side of a cross-course than it is on the other side.

22. A lode is seldom shifted downward in the manner and direction as illustrated by Fig. 1, at *c, c* and *c;* and as rarely horizontally; but it is more frequently found on the obtuse-angled side, and when not thus situated, if the stratum were transparent, it would be seen that a very small intervening block of country had been shifted to accommodate the more regular motions of the much more extensive controlling sections.

23. The length of any one lode is generally, and the total length of all the lodes of a system of veins that have been thus shifted, is invariably less than the present length of the ground in which they now lie; because (as generally supposed) the strata have slidden, or contracted and shortened, more in the one direction than the other.

24. Other guides to the positions of slidden lodes are the comparative percolations and mineralizations (ascertained practically by taste or analysis) of the waters from both ways, and a slight turning of the vein towards its disjuncted part.

25. True fissure veins seldom crop out boldly above the surface of the ground. This is a general rule in Cornwall.

26. Much clay besides the walls and the quartz of the vein, is a good sign for mineral; probably because it was decomposed from a congenial feldspathic bedrock, and also marks a proportionately long time for production, with great age of veins.

27. Rich lodes have their completely barren spots, and the poorest lodes have occasional stones of rich ores, which should not infatuate and deceive.

28. Lodes of regular yield are the desideratum of the miner. They are easily worked and are more reliable.

*A lode or vein, to be recognized as such by miners, whether it be "true fissure lode," traversing through all rocks, or "wedge lode," occupying the spaces between upturned layers of natural stratum, or "intervening lode," within the terminal planes of two entirely different opposing strata, must contain at least one of the matrices, quartz, fluor spar, calc spar, or heavy spar in addition to its metals and metallic ores. Therefore, any formation which is chiefly composed of country rock instead of the above matrices, although lying between equally smooth, well-defined walls, and yielding minerals from irregular seams and pockets, cannot be deemed a lode or vein in a correct mining sense. It is either a mineralized igneous dike, or reef of tilted stratum.

National Thanksgiving Day.

Proclamation by the President.

By the President of the United States—A Proclamation: The recurrence of that season at which it is the habit of our people to make devout and public confession of their constant dependence upon divine favor for all the good gifts of life and happiness, and public peace, and prosperity, exhibits in the record of the year abundant reasons for our gratitude and thanksgiving. Exuberant harvests, productive mines, ample crops of staples, the products of trade and manufactures, have enriched the country. The resources thus furnished to our reviving industry and expanding commerce, and hastening the day when discords and distress through the length and breadth of the land will under the continued favor of Providence, have given way to confidence and energy and assured prosperity. Peace with all nations has remained unbroken, domestic tranquility has prevailed, and the institutions, liberty and justice, which the wisdom and virtue of our fathers established, remain the glory and defense of their children. The general prevalence of the blessings of health throughout our wide land has made more conspicuous the sufferings and sorrows which the dark shadow of pestilence has cast upon a portion of our people. This heavy affliction, even, the Divine Ruler has tempered to suffering communities in the universal sympathy and succor which have flowed to their relief, and the whole nation may rejoice in the unity of spirit in our people, by which they cheerfully share another's burden.

Now, therefore, I, Rutherford B. Hayes, President of the United States, do appoint Thursday, the 28th of November next, as a day of national thanksgiving and prayer, and I earnestly recommend that, withdrawing themselves from secular cares and labors, the people of the United States do meet together on that day, in their respective places of worship, there to give thanks and praise to Almighty God for His mercies, and to devoutly beseech their continuance.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed. Done at the city of Washington, this 30th day of October, in the year of our Lord, 1878, and of the independence of the United States the 103d.

R. B. HAYES, President.

WM. M. EVARTS, Secretary of State.

NEW WATER MOTOR.—Messrs. W. H. Bailey & Co., of Salford, England, have recently designed a new water motor which works under the ordinary pressure of the water sent through the street mains. In appearance it is somewhat similar to an ordinary horizontal steam engine. It has an oscillating cylinder, with parts so arranged that the motion of the cylinder cuts off the supply of water at the end of the stroke, a reciprocating action being thereby obtained and imparted to the fly-wheel by the ordinary crank arrangements. There are no loose valves or tappets in connection with the motor, and all the fixing it requires may be done by a plumber, as there is nothing more to do than to connect the machine with a pipe from the street main. One of the motors is said to be working very successfully at the bottom of a colliery shaft near Bolton, the power being supplied by the water pumped up from the pit by the steam engine. A large number of laden wagons are drawn up an incline with great ease by this means. The motion has also been utilized for sawing timber, printing newspapers, etc.—*Iron Age.*

COFFEE-HULLING MACHINE.—An improved machine for hulling, scouring, and cleaning coffee has been patented by Mr. Patrick McAuliffe, of New York city. This invention relates to an improved machine by which coffee of all grades may be hulled, scoured and cleaned, and different kinds and grades of coffee mixed and turned out with uniform appearance, and by which no annoyance from dust is experienced as the impurities are drawn off and collected. The machine has a continuous operation, as it receives the coffee at one end and discharges it at the opposite end in a uniform and marketable condition.—*Scientific American.*

NEW YORK COTTONS FOR SOUTH AMERICA.—The Utica Steam Cotton Mills Company has received an order for a lot of the Utica gray sheetings from Guayaquil, Equador, South America. This will be the first load they have shipped to the western coast of South America, although it is of frequent occurrence sending goods to the eastern South American seaports.

IN the mills at Wigan, England, 1,079 looms and 94,000 spindles are stopped, and 25,000 looms and 310,000 spindles are running on short time.

Transactions in Public Lands.

A dispetch from Washington announces that J. A. Willimson, Commissioner of the Geueral Land Office, has completed his annual report to the Secretary of the Interior. It shows that during the fiscal year ending Juue 30th, 8,686,178 acres of land were disposed of, and 8,041,011 acres were surveyed, in addition to 721,618,748 acres previously surveyed. The total number of acres of puhlic domain still unsurveyed is something over one thousand million acres. The disposals were mainly as follows: Homestead entries, 4,418,344 acres; timber culture entries, 1,870,434; deeert land entries, 3,105,553; cash entriee, 877,555; grants to railroads, 606,340; swamp lands patented, 202,926; other grants to States, 214,992. These figures show a great increase in quantity of land taken up by the elass of actual eettlers as homesteads and for the purpose of timhor eulture. Cash receipts amount to $2,022,536, being $569,567 more than the receipts for the preceding yeer. Commissioner Williamson recommends in regard to lapsed railroad grants, that Congress should either declare the grants forfeited and restore the lands to disposal as part of the puhlic domain, or extend the time for ths comploton of the road. Among other recommeudations contained in the report are the following: For legislation to transfer auy titlo the United States may possess in islands and beds of "meandored" lands, sloughs and ponds, to the States in which they respectively lie; to nllow affidavits in preemption cases to bo taken before Judgee and clerks of Courts of record anywhere in local districts, instead of eompelling attendanco hefore Registers and Receivers; to repeal tho town site law, except as regards applications made under the law previous to its recent amendments; to euahle the department to extend prompt relief to parties entering puhlic land where a titlo cannot be confirmed, and also in eases where erroneous and illegal exactions havo heen made, by refunding to them the money paid in error. The report exhihite in detail the work done in connection with the euppression of timher depredatore on public leuds, and presents a variety of information with regard to ahandoned military and Indian reservations, the adjustment of private land claims and miscellaneoue matters. In conclusion, the Commissioner refers to and earnestly reitsrates former representations made by him regarding the need of an increase of the numher of clerks and of the amounts of appropriations for the dispatch of the constantly-accumulating business of the land hureau.

The Berrens Quicksilver Furnace.

The *Iron Age* takes from the *Correspondance Scientifique* the following description of an apparatus constructed by Hippolyte Berrens, and tested, with remarkahle results, at Barcelona by a commission of Spanish government engineers:

It consists of a horizontal or vertical furnace, eherged periodically, as its action is not continuous. It connects with a transmission chamber, from which the gases pass into condensers, 17 to 25 in numher, the shape of which resemhles that of two cones united at their base. The lower cone is huried in the ground, the upper, made of sheet iron, is cooled by a continuous stream of water. Eaoh condenser has a capacity of ahout 30 cuhio feet. They communicate with one another at their lower parts. The last one of the system is connected with a chamher containing charcoal, destined to remove the last traces of mercury from the gases. There is no chimney, but an aspirator instead, which permits accurate regulation of the furnace. The walle of the apparatus are coated with a layer of a mixture of equal parts of charcoal powder and cement. The furnace at Barcelona was charged with 15,717 pounds of 2.76% ore. Theoretically, therefore, the yield should have been 455.39 pounds of quicksilver, hut in fact it was 450.96, which proves a loss of 0.79%, although the carbon of the last receiver was not examined. Gold leaf placed at the end of the apparatus did not show the least trace of amalgam. A second trial was made to test the efficiency of the apparatus under the most trying circumstances, and it is but just to state that both the experiments were made in eummer, at a time when work at Almaden is entirely suspended on account of the too heavy loss of quicksilver. In this second trial the exhauster was run at eo high a speed that the ore in the furnace was glazed; the time of the operation was decreased by 25 honrs, and yet the yield from a charge of 15,790 pounds of 2.82% ore was 434.51 pounds, the loss amounting to 3.62%. A horizontal furnace is now huilding at Anfondeguilla capable of working 20 to 30 tons of 1% ore per day.

THE government of India will probably make English gold coins legal tender, prohihiting the importation, after a given time, of har silver. Rupees and smaller coins will be used as fractionel currency.

COPPER or hrass may be coated with bismuth by ueing a bath consisting of 1,000 parts of water, slightly acidulated with hydrochloric acid, in which 25 to 30 parts of ammonia-bismuth chloride is dissolved.

THE receipts at the San Francisco License Office for the transfer of mining etock (ten eent tax), for October, amounted to $8,601.10.

PERU owes to British bondholders £36,000,000.

Useful Information.

Effects of Impurities on Iron.

Tho principal and most objectionable impurities found in iron and steel are sulphur, phosphorus, silicon, calcium, and magnesium. Sulphur and calcium make iron brittlo at a red heat; this is called "red-short" iron; phosphorus and silicon make it hiittle at low temperatnre; thie is kuown as "cold-short" iron.

The latter is the greater defect of tho two. To avoid sulphur, uso fuel, which is free from sulphur; iron, which has been smelted, or puddled with charcoal, or with coke, that is, free from sulphur, is ths strongest and toughest. Hence the high estimatiou in which charcoal is held.

Phosphorus comes either from phosphate of limo contained in the oro, the fuel, or the flux, or from phosphate of iron in the ore—phosphorns being most ahundant in those strata where animal remains are found.

The presence of calcium and silicon can only bo avoided hy the use of ores that contain neither silica nor lime, such as pnre hacmatite or pure magnetic iron ore.

Silicon mekes iron brittle and hard, and has a similar effect on it as phoephorus; it is constantly found in cast iron; hot-blast iron has more silicon usually than ie found in cold-blast iron.

Alloys of iron are of but small importance to the founder. The following may be briefly noted:

Chromium does not readily combine with iron, which it makes excessively hard. [The chromo iron ore, which exists in such large quantitiss on the Pacific coast, may at no distant day he utilized. Chrome iron is so very hard that it may prove peculiarly adapted for mill stamps.—EDS.]

Arsenic imparts a fine white color to iron, but makes it brittle.

Gold combines very readily with iron; it serves as a solder for small iron castings, such as hreast-pine and similar articles.

Silver does not nnite well with iron, but a little may he alloyed with it; it makes iron very hard and brittle. The alloy is very liable to eorrosion.

Copper, if alloyed with iron, is not regarded as a homogeneous compound; but a emall quantity of iron added to brass increases its tensile strength.

Tin with iron makes a hard but beautiful alloy, and can he mixed in any given proportions, which, if nearly half and half, assumes a fine white color, with the hardness and luster of steel.

Alloys of iron are but seldom used at present, owing to the ease and economical waye in which it can he gilded, silvered, end galvanized, or coated with other metals.—*Spretson.*

SEA-WEED AS MANURE.—The following from the Boston *Journal of Chemistry* may serve as a useful hint to some of our farmers. The seaweed, which occurs in such immense quantities along our coast, may, perhaps, be utilized as it is in the countries spoken of: The excellent purpose this manure has answered in Holland has led the farmers in the neighborhood of Bremerhaven to apply the seaweed washed up by the river Weser as a manure for their land. Chemical investigation has proved that it is as rich in quabty as that used in Holland, as it is produced by the same caneee. Like the Ems, the Weser carries along quantities of rich mire, hut as soon as the outflow meets the tide it comes to a standstill, and receives from the ocean innumerable bodies of dead animalcules and plants, which increase in a great degree its fertilizing value. When gathered freshly, seaweed contains more than half its weight in water; but if left to dry the water evaporates, and it is thus eesier of transportetion. Seaweed should not he applied to the land when just taken from the water, as in such case it does harm to the crops. Such menure is found to he especially enitable for saudy and boggy land.

DEPTHS OF LAKES.—The Bavarian *Courier* publishee an interesting comparative statement of the depth of lakes. Among European lakes the Achensee, in the Tyrol, heads the list. At eome points the depth of this lake amounts to 2,500 feet. The greateet depth of the Lake of Constance is ahout 975 feet, that of the Chiemsee about 458 feet, and that of the Walchen and Kouigesee, 611 feet. The measuremeuts made ahout 1870 at the Red sea ehowed that at its deepest part ite depth is 1,836 feet; hut if we consider that the level of this lake is already 1,394 feet helow the level of the Mediterranean, then we lind that the total depreesion in the soil here amounts really to 3,230 feet. The Lake of Tiberias is extremely shallow in comparison; on its eastern part tbe average depth is only 26 feet, while on the western eide it lies hetween 19 and 22 feet. In Lake Baikal depths have heen found whicb, for a leke, are utterly astoniehing. In the upper part of the lake the depth is 10,800 feet (ahout the hight of Mount Etna), but downward the hottom constantly descends, and near the opposite hank the depth amounts to 13.230 feet. The depth far exceeds that of the Mediterranean sea, which, at its greatest part, measures only 7,800.

Estimating the Quality of Cast Iron.

The following aids for roughly estimating the quality of cast iron, are detailed hy Spretson:

When the color is a uniform dark gray the iron is tough, provided there ho also high metallic luster; hut if there bo no metallic luster the iron will be more easily crumhled than in the former case. The weakest eort of cast iron is where the fracture is of a dark color, mottled and without luster.

The iron may be accounted hard, tenacious and stiff when the color of the fracture is lightish gray, with a high metallic luster.

When the color ie light gray without metallic luster, the iron is hard and brittle.

When the color ie dull white, the iron is still more hard and brittle than in the last case.

When the fracture is grayish-whits interspersed with small radiating crystals, the iron is extremely hard and brittle.

When cast iron is dissolved in muriate of lime or muriate of magnesia, the specific gravity is reduced to 2.155; most of the iron is removed and the remainder consists of graphite with the impurities of cast iron. A similar change takes place when weaver's paste is applied to iron cylinders. Sea-water when applied for a considerable time has the same effect. It takes much longer to seturate white cast iron than to affect gray. The soft gray iron yields easily to ths file after the outer crust has been removed, and in a cold state is slightly malleable.

It may also he stated that the quality of iron in a melted state is readily judged hy a practiced eye, from the nature of the agitated aspect of its surface. The mass of fluid seems to undergo a circulation within itself, having the appearance of every-varying network. When this network is minutely subdivided, it indicates soft iron. If, on the contrary, the iron he thrown up in large convolutions, the quality of the metal must be hard.

How to Kill Mosquitoes.

EDITORS PRESS:—When they are on the well take a lighted candle and, holding it above them, carry it toward the wall where they are resting. As the light approaches them lower it gradually, until the flame is just in front of the mosquito; then push it towards the wall, until the mosquito springs into the flame and is destroyed. With care in adjusting the light, they will almost invariably be caught in the flame.

If the candle is brought toward them from heneath, they will feel the heat and escape. If they are on the ceiling drive them off, and attack them when they light on the walls.

This method is quick and sure, and leaves no stain on tho wall. It can he done also inside of mosquito nets, taking proper care not to bring the light in contact with the sides or too near the top. Try it. HENRY LOOMIS.

San Rafael, Cal.

TO MAKE CORKS AIR-TIGHT AND WATER-TIGHT.—A German chemical journal, says the Boston *Journal of Chemistry*, commends the use of paraffine as the hest method of making porous corks gas and water-tight. Allow the corks to remain for about five minutes heneath the surface of melted paraffine in a suitahle vessel, the corks being held down either hy a perforated lid, wire screen, or similar device. Corks thus prepared can he easily cut and hored, have a perfectly smooth exterior, may he introduced and removed from the neck of a flask with ease, and make an absolutely perfect seal.

A REMARKABLE case is given in the *Journal de Medicine* of the effect of the habitual use of milk in white-lead works. In some French lead mills it was observed that in a large working population two men who drank much milk daily were not affected by lead. On the general use of milk throughout the works the colic vanished entirely. Each operative was given enough extra pay to huy a quart of milk a day. From 1868 to 1871 no cases of colic had occurred.

Good Health.

Poisonous Tin Plate.

The Boston *Journal of Chemistry* after commenting upon the many hidden dangere that surround us in our daily life, goes on to say:

Attention has recently heen called to a new riek of chronic poisoning by the old enemy, lead. What we call "tin" veesels—that is, sheet iron coated with tin—are in daily use in every honsehold in the land. They are cheap, durable and convenient, and have been considered perfectly safe for the thousand culinary purposee to which they are devoted. They *are* safe if the tin-plate is honestly made; hut unfortunately this is not always to he counted upon. Tin is oomparatively cheap, but lead is cheaper; and an alloy of the two mentals may he ueed in place of the dearer one, with profit to the manufacturer though with serious detriment to the user. The alloy is readily acted upon by ecids, and salts of lead are thus introduced into food. The Michigan State Boerd of Health has lately bsen investigating this subject, having been led to do so by a letter from a physician who found that certain cases of what had been taken for chorea wore really *paralysis agitans*, which could bo traced to this kind of lead poisoniug. Other cases were brought to light in which children had died of meningitis, fits and paralytic affections, caused hy milk kept in such vessels, the acid in the fluid having dissolved the lead. Malic, citric, and other fruit acide are of course quicker and more energetic in their action upon the pernicious alloy. The danger is the greater, because lead salts are *cumulative* poisons. The effect of ono or two small doses may not be perceptible, hut infinitesimal doses, constantly repeated, will in tho end prove injurious, if not fatal.

Analysis of a large number of epecimens of tin-plate used in culinary articles ehowed tho presence of an alloy with lead in elmost every instance, and often in large quantities. It is safe to assert that a large proportion of the tinned wares in tho market are unfit for use on this account.

That we may not be accused of exciting fears which may he groundless, we will inform our readers how they can settle the question for themselves hy a simple and easy test. Put a drop of strong nitric acid on the suspeeted "tin," and rub it over a spaee as large as a dime. Warm it very gently till it is dry, and then let fall two drops of a solution of iodide of potassium on the spot. If lead is present it will he shown by a hright yellow color, due to the formation of iodide of lead.

It is stated by Dr. Kedzie that a peculiar kind of tin-plate, the coating of which ie largely made up of lead, is coming into general use for roofing, eeves-troughs and conductors; and it is suggested that much of this lead will eventually he dissolved and find its way into household cisterns. Susceptible persons may be poisoned hy washing in the leed-charged water, and all who drink it, even after it is filtered, are in danger of chronic lead poisoning. There is also risk in the use of glazed earthen vessels, if, as is often the case, the glazing contains oxide of lead. The danger in the use of certain enameled iron vessels was pointed out some time ago in the *Journal;* and it is said that these poisonous wares have not entirely disappeared from the markct.

Warts in Skin Grafting.

Dr. Charles A. Seale, of New York, has made a discovery at which all persons afflicted with these handsome excresenees may take comfort. His discovery is announced in the *Medical Record* as follows: As common warts of the skin are collections of vascular papillæ, admitting of easy separation without injury to their excessively thick layer of well-nourished epidermis, the idea was oonceived that, hy their use for the purpose of skin grafting hetter and more rapid results would he ohtained than when the ordinary ekin of less vitality is used. As proof of the theory the following case is cited, where there hed been complete destruction of all the skin on the dorsum of the foot, involving to a great extent the deep cellular tissue, and where for several weeks no healing advanced until grafts of freshly removed warts from the patieut's band immediately started little islande of new tissue, which rapidly increased, until they coalesced and met the margins of the border skin, thereby completely covering the foot hy firm, protecting integument.

Warts of the hand can be used with batter results than smell pieces of uormal skin, in skin grafting, in consequence of beiug easily separated, uninjured, into numerous cylindrical rods of great vascularity, and containiug a large proportion of hypertrophied epithelium, which, when planted in healthy grenulating tissue, readily adapt themselves to the new soil, receiving direct nourishment, and quickly growing as starting points for a new and smooth epithelial covering.

OPIUM AND THE VICTIMS OF FAMINE.—The largest number of victims and the earliest victims to the Chinese famine have heen opium smokers. This fact has been recognized by the government, who issne a stringent edict complaining of the covetous carelessness of the people in raising the poppy rather than cereals, and prohihiting the future cultivation of the noxious drug. The district magistrate of Tientsin has personally visited the opium-smoking resorts and closed them all. Soldiers and officials are strictly prohihited from smoking, uuder heavy penaltiee. This reminds us strongly of the eeneitiveness which those accustomed to the use of alcoholic liquors showed to the yellow fever in our Southern States.

DON'T SWALLOW CHERRY PITS.—A man died in Vermont recently, after euffering from dyspepsia for 20 years. Some peculiar circumetanees in his case led to a post-mortem examination, which revealed 13 cherry stonee imhedded in the mucous membrane of the stomach, causing a thickening of the walle of that organ some three-fourths of an inch, and ultimately the man's death. It was the opinion of the phyeicians that the stones had heen there many years.—*Herald of Health.*

AN account is given of a man who tore hie diaphragm loose, and, as might he expected, died immediately after, hy stuffing himself with potato-soup, tea and milk, and then taking to promote digestion, a good-sized dose of bicerhonate of soda.

CORRESPONDENCE.—Lixiviation versus Amalgamation, 306.
MECHANICAL PROGRESS.—Progress in the Manufacture of Steel; Improved Revolving Roller Anti-friction Bearing; Novel Compressed Air Motor; "Soft-Center" Steel; A New Street Car Motor, 307.
SCIENTIFIC PROGRESS.—Le Conte's Theory of Mountain Formation; A New Anthracite; Gas Cloth; New Process for Testing Air; Steam as a Light Reflector; Reforms in Coal Washing; The Electric Light Scare; The Hayden Expedition, 307.
MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 303
MINING SUMMARY from California, Colorado, Nevada, Oregon and Utah, 309-316.
NEWS IN BRIEF on page 317 and other pages.
USEFUL INFORMATION.—Effects of Impurities on Iron; Sea-weed as Manure; Depths of Lakes; Estimating the Quality of Cast Iron; How to Kill Mosquitos; To Make Corks Air-tight and Water-tight, 311.
GOOD HEALTH.—Poisonous Tin Plate; Warts in Skin Grafting; Opium and the Victims of Famine; Don't Swallow Cherry Pits, 311.
MISCELLANEOUS.—Mechanics' Liens; The Martin White Case; Volcanic Eruptions in the South Seas; Americans Ahead of Europeans, 306. True Fissure Veins; National Thanksgiving Day; New Water Motor; Coffee-Hulling Machine; New York Cotton for South America, 310. Transactions in Public Lands; The Berrens Quicksilver Furnace, 311.

NEW ADVERTISEMENTS.
Thompson & Evans, Engineers and Machinists, S. F.

The Week.

The most startling news of the week has been the report of the discharge of men from the Bonanza mines. This is noticed in another column. In fact the Comstock is at present the most gloomy mining district from which we have advices. Nevada county in our own State is jubilant over the prospects of the coming seasou. A correspondent to the Downieville *Messenger*, says of Northern Sierra, that this is the most remunerative year for drift and hydraulic diggings ever known in that section of the country. And the quartz miners of Sierra county are prosperous. The Extra company of Copper City, Shasta, have been sending for the past month an average of $1,000 gold bullion a day to San Francisco, the product of one mine working about fifteen men. The news from Bodie is so invariably good that it becomes monotonous to record it. However, this week a new item may be added: Bulwer and Belvidere expect to become bullion producers at an early date. Within a radius of 30 miles about Winnemucca, Nevada, two new mining districts have been organized, one of them in the range of mountains which separate Paradise and Quin valleys.

In Colorado, Silver Cliff and Leadville have already rivals that may prove dangerous. General mining revival is reported from Montana. The region of Silver City, Idaho, is witneseing greater activity than hae heen noted there at this season for several years. Yankee Fork and vicinity, is said to be steadily improving. Snake River placers are attracting attention. We have heard an old miner dilate upon the riches which he knew capital could extract from placers on this river. His prophecies may he fulfilled. In Tombstone district, Arizona, "eome wonderful developments are taking place." In Glohe district, the word is, "increased force of labors," "night ehifts put on." This district, as well as other parts of Arizona, has suffered through mismanagement. Poor management may blast the hopes of a truely worthy section. But every district must have its era of careless working. This era is past, it is to be hoped on our coast.

"The Way the Wind Blows."

Every day the miner is becoming a more important unit of the community. West of the Rockies, no one is doing more at the present moment to develop all industries and banish "hard times" than is the miner. He furnishes work for the foundries, when steamship companies are so broken that they cannot send in orders. He calls for supplies, when in every other direction the market seems to be glutted, and the provision men are blue. He employs labor in building railroads, and while these are under way he keeps numberlcss teamsters busy on the roads transporting his ore. Even the lawyer finds employment from the miner. And last, but not least, the needy editors come in for a share. A mining camp gets a boarding-house and a saloon, and then it is prepared for a newspaper. The miner is doing all this for the country at present. He is the life of all markets. And any man who is cunning enough to set his sail according to the wind, will address his efforts to the service of the miner.

The miner has many necessities; the man who ministers to them will be paid in bullion. Daily we read of accidents in the mines, by which the lives of the miners are endangered. Many of these, it would seem, cannot be avoided by any meehanical inventions. No safety lamp or patent cage safeties will prevent the occurrence of many a fatal cave. But when a miner is killed by the breaking of the wire-rope by which the cage is hoisted; or when the engineer has to depend upon the counting of tags to determine the depth to which he has let the cage, and, making a mistake, drops the latter too far and upon a miner; or when a pinion-wheel breaks, or a brake-band snaps, and causes the death of a handful of men, tben inventors and mechanics may, if they are quick, see an invitation for them to increase their income.

But it is not only by carelessness of the miuer himself, or by imperfections in machinery, that the miner's life is jeopardized. Much of the danger to the common laborers in mines, arises from incompetence in the superintendents. Caves occur from careless timbering. Most aggravating, because entirely avoidable, accidents happen from criminal neglect of the condition of shafts, and the disposition of material about the mouth of the same. There is no plea whatever for a superintendent who allows rocks to be piled about the mouth of a shaft, or planks to be left insecurely at the entrances of drifts. Yet now and again we hear of miners crushed bcneath rocks and planks falling down tbe shafts, and the verdict of the juries is "Accidental Death," with no additional recommendation, that the euperintendent of the mine at which the accident occurred be warned that any further negligence on his part will he considered criminal. Such accidents as these, happen most frequently at new mines. But they are by no means unknown at older ones that should give better accounts. The mine superintendent is an important character. His is a profession, and he should study it as such. It will profit him to do so.

Aside from that which concerns the miner more directly, there is vast field for the exercise of mechanical skill and inventive genius in matters relating rather to the product for which he labors, be it ore or bullion. Edison's plan for the discovery of bonanzae is not altogether a chimera, even though it is as yet rather uncouth and intangible. Drills are not yet perfect, and if we turn to the field of coal-mining which has important bearings on the bullion product,—even if it is not recognized as a great industry of our coast,—we fiud there that the inventor of a convenient and practicable machine for cutting and loading the product, may rest the remainder of his life. When mining comes to be carried on to such a depth as it is on the Comstock now, and as it will continue to he there and elsewhere so long as true fissure veins exist and human nature remaius the same, it seems incredible that the old-fashioned drum and rope method of hoisting ore can long survive. A recent writer has suggested the use of pneumatic tubes for this purpose. Is it not a very apt suggestion? For it offere solution to another problem, viz: How to overcome the great heat fouud at such depths. This latter ie not to he solved by the manipulation of drafts. The air compressor drills were a step in the right direction. Pneumatic tubes may be the next.

But it ie above ground that the inventor will find widest scope. There is not one metallurgical process that even approaches perfection. The ignorance and clumsiness exhibited in metallurgical worke is simply startling. Quicksilver wasted, gold and silver wasted, fuel and labor thrown away. Yet with all thie there is a profit even now. The lesson is obvious. The children of another generation will, it has been said, work the slag-piles and tailings dumps of their ancestors and grow rich at it. Ore-stamps, amalgamators, settlers, retorts—all require improvement, if not entire reconstruction in both principle and practice. And thie improvement is to come from students in our colleges of mines. When this is read it will call forth many a smile. A mining expert has been defiued—by a Eureka miner, we believe—as a man that "wears glasses, talks Dutch and don't know a durned thing about mining." A contemporary took occasion a short time ago to thus attack college men: "Book learning, broad cloth and frills are not worth a picayune compared with good sound sense, and practical experience. We presume some fine-haired, scientific 'experts' laughed in their sleeves when it was announced that Thomas Peard, a rough miner, working on his regular shift, was put in charge of the Pittsburg. The laugh is on the other side now." And another, shortly after, takes opportunity "to mention that broad-clothed and be-jeweled mining superintendents, who can't tell a mining shaft from a monitor, or a patent deflecting nozzle from an air compressor, are rapidly losing caste with stockholders and their representatives."

The tendency to cry down educated men, which this indicates, is the rcsult of a quick conclusion drawn from iusufficient observation. The professors of our own University understand its origin. Accordingly they say: "We try to make our students understand that when they leave college they are *not fit* to take charge of a mine, or do any other big thing. They must begin at the bottom, study in practice to comprehend the meaning of the principles which they have studied in theory. If they do this, their time will come." It is useless to attempt to give the numberless cases that refute this senseless prejudice. We will merely add that "Ore-dressing," as a science and as an art, grew up entirely from the skillful handling of mathematics by a student.

The Improved O'Harra Furnace.

Mr. D. J. O'Harra, of Reno, Nevada, has recently procured through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent on certain improvements in his furnace, which increases its efficieney and simplify its operation. The furnace is a horizontal one, intended for desulphurizing and chloridizing ores, and is now in successful operation at several mines in this State and Nevada. The improvements consist in constructing the furnace with two longitudinal compartments, so as to form two hearths, one above the other, with a connecting passage between them. On the upper hearth the desulphurization of the ore is accomplished, and in the lower the chloridization. An endless chain, carrying conveyors in which are hoes or stirrers, passes through both compartments in opposite directions through each, stirring up the ore and gradually conveying it from tbe feed to the discharge opening. This chain passes some distance into the open air in its revolutions, so as to bc cooled before again entering the furnace, thus preventing it from being destroyed by the heat. Openings are formed in the side of the furnace, hy which the supply of oxygen may be regulated for ore, more or less highly sulphureted. Doors at the ends of the hearth open and close as each conveyor on the chain passes or enters the furnace.

There are four fire places in the furnace, two in each side. Two of these are arranged that the heat may be directed to hoth the upper and lower compartment, and the other two to discharge the heat into the lower compartment alone, whence it forces way through an opening into the upper one, aud thence to the stack. At each end of the fire places, just under the grates and between them and the ash floor in order of the furnace are a number of small openings passing through the bridge wall that separates the fire places from the hearths. These openings then connect with the lower compartments and admit a large supply of oxygen to the flame of the fire as it passes from the fire place over the bridge wall, thus allowing all the carbon to be consumed, aud proving a first-class acidizing flume.

On the arch of the upper compartment are formed a series of jogs or projections which act as baffilers to intercept the flying particles of ore carried onward by the draft, and precipitate them to the hearth where they are again mixed with the mass of ore.

The ore is fed into a hopper from the battery and falls on to the upper hearth, the conveyors carrying to the opening where it falls to the lower hearth. As the ore passes along the upper hearth it is desulphurized by the heat furnished by the fires and by the combustion of the sulphur in the ore. This action is assisted by the oxygen supplied hy the air admitted through the side openings. For a chloridizing roasting the salt is unused with the ore, as it is fed into the hopper, and becomes thoroughly intermingled with it by the stirring elhow of the hoes. If there is any free silver in the ore it gets the benefit of the chlorine vapors passing up from the lower hearth. When the ore falls through the opening ou to the lower hearth, the fall breaks any spongy lumps in masses that may have formed, and the ore is again stirred over and over and carried elowly along over the lower hearth through the flame and heat. As the ore is moved along in contact with the fires opening into the lower compartment, the salt gives up its chlorine by the action of the sulphurous gases rising from the decomposing metallic sulphates which have been generated which action converts the metalic sulphate into chloride, with the simultaneous production of sulphate of soda.

The process is essentially the same as the well-known Freiberg process, but the mechanical devices of the furnaee, and the peculiarity of the construction, enable the operator to thoroughly desulphurize and chloridize the ore to a higher percentage, and with less cost of fnel and labor. When the desulphurization has been accomplished, and sulphurous acid ceases to be formed, with the old method, it has been necessary to increase the fires to complete the finishing calcination by decomposing the salt so that the chlorine evolved will transform the metallie sulphates into chlorides.

By Mr. O'Harra's method no inerease of fires is necessary. The construction of the furnace is such that the heat is greatest just where it is needed, viz: At the point where the ore has been desulphurized, and where it is ready to receive the chlorine from the decomposing salt, in order to be thoroughly chloridized. The ore, while in the upper hearth is freed from its sulphur, by the combustion of that substance, hy the heat afforded by the fires, and the combustion of the sulphur is assisted by the supply of oxygen admitted through side openings. During all the time a certain amount of chlorine vapor is rising from the lower compartment, and assisting in transforming any metallic silver into a chloride.

By the time the ore drops on to the lower hearth, the metals have became sulphates, and here more heat is required, in order that these sulphates may decompose the salt, by the sulphur being liberated and uniting with the oxygen and hydrogen, forming sulphuric acid, which unites with the sodium and forms sulphate of soda, while the chlorine is set free and converts the metals into chlorides. The ore has became gradually more and more heated in the passage through the upper hearth, and by the time the extra heat ie required, as stated, it comes immediately in front of the same fires, that have during the whole process furnished the heat. As the ore passes along the lower hearths, it reaches the last fire, when the iutense heat will effectually cause the chemical changes described to occur, and the ore is dropped from the furnace tboroughly desulphurized and chloridized, having been stirred over and over in its passage through by the hoes, so that every particle of the ore has been subjected to the action of the heat and chlorine vapors.

By the means described the inventor claims that he can chloridize any silver ores no matter how rebellious or refractory because he can give them any length of time in the furnace that may be necessary, and gauge the heat to suit the class of ore. The ore may be passed through quickly or slowly as its character requires. By decomposing the salt and cooling the chlorine at the point where the ore is exactly in condition to receive it he claims to chloridize to a high degree with about 33% less salt than has been deemed necessary, no salt being wasted by decomposing before the sulphates are formed. Ordinarily the ore will be from four to ten hours in passing through the furnace, according to the character. One man is required to attend the fires, no other attention being necessary, as the ore may be fed to the hopper from the battery by any mechanical means. By the peculiar construction of the furnace, the ore is fed and discharged at the same end. The battery and machinery being at the same end, tbe ore may be elevated and passed to the amalgamating appliances with very little trouble or expense of handling.

The Geological Section.

The Geological Section of the California Academy of Sciences held its first regular meeting last Saturday, November 9th, 1878. There were present the following members: Messrs. Amos Bowman, Major Kup, C. D. Gibbes, J. R. Scupham, also Prof. Jos. Le Conte, Prof. Price, A. Harding, A. W. Jackson, Jr., S. B. Christy. The first business of the society was the reception of the constitution and hy-laws, prepared by a committee composed of Messrs. Bowman, Scupham and Jackson. The constitution reported by them was adopted, with a few slight changes.

The society then proceeded to an election of officers with the following unanimous result: President, Prof. Jos. Le Conte; Vice-President, Prof. Wm. Ashhurner; Council, Profs. Jos. Le Conte, Ashburner and Price; Secretary, S. B. Christy; Treasurer, J. R. Scupham.

The society after some general discussion then adjourned.

The purpose of this society is to gather together what real interest there is on the coast in the subjects of geology, mineralogy and its applications to mining. It is to be hoped that the starting of such a section is not premature, and that there is really sufficient interest in pure science as well as in its applications to make it a success. There is a wide field open to it on the coast, and we hope that the section will be able to show a good record for itself in the future.

MINING PATENTS.—A mineral patent has been issued to D. F. Hughes for the Jewess Quicksilver mine, in San Francisco land district. The issue of a patent on another quicksilver mine, the New Idria, is now occupying the attention of the law officers of the Interior Department.

THE Squaw Lake Co., Oregon, is still piping away on their gravel beds with satisfactory results. They will make a clean-up as soon as their water supply fails—probably in a couple of weeks.

THE Alice M. Co. has subscribed $25 per month toward the erection of a miner's hospital at Butte, Montana Territory.

ON Nov. 13th, 10,000 pounds of Silver King concentrations were shipped from Yuma.

Mines and Works of Almaden.—No. 9.

[Translated for the Press from "ANNALES DES MINES."]

IV.—Abandoned Mines.

Having finished the above study, it remains for us to speak some words of some other deposits of mercury near to those of Almaden, but to-day abandoned.

The principal ones, and those whose exploitation was for the longest time continued, are those of Almadenejos, and of Valdeazogues, at 12 to 15 kilometers to east-southeast of Almaden. At the mine of Concepcion Vieja, situated below Almadenejos, they have exploited two deposits which are parallel and very near to each other, under the names of El Rompimiento and Santa Teresa. Two other deposits, El Lineal and the Auguila, were still exploited in 1860 at the mine Concepcion Nueva, one kilometer west of Almadenejos; about this time the product became so small, that it was decided to abandon it in 1861. Two deposits, San Fernando and Las Esperanzas, at Valdeazogues, were of the same sort.

There were exploited, two or three centuries ago, to the west of Almaden, under the name of the Fucares,* mines which reached the depth of about 400 meters, and in which, to the contrary of those of Almaden, the richest parts were found to the east. More distant finally, to the west, is found another mine called San Julian. Also to the north, cinnabar is taken from the mines of Gnadalperal and Las Cuevas, towards Gargantiel.

*From the name of the German bankers, the Fugger brothers, to whom the use of these mines was for a long time leased.

But all these deposits present a great difference from those of Almaden, even though the nature of the vein be the same. At the Concepcion Nueva the upper levels gave for certain years about 560 tons of mercury, but the ore disappeared almost altogether at the depth of about 50 meters. Less rich at the Concepcion Vieja, the ore was there more constant, but ceased, nevertheless, at 250 meters depth. This has been the same at all the other mines, the reverse of what has been observed at least so far at Almaden.

Should we see in these deposits the prolongation to the east and west of those of Almaden? The cinnabariferous beds of Almadenejos and Valdeazogues seem, when one looks for their prolongation to the west, to disappear at seven or eight kilometers to the south of Almaden. Those of Las Cuevas to the contrary disappear at six kilometers to the north. One recognizes well, between Almaden and Almadenejos, some traces of cinnabar which seem to establish between the two regions a sort of continuity; the mines of the Fucares would be a new station on the same line (Fig. 4). One may then suppose that the ensemble of the deposits forms a great system directed a little more to the south than that of the strata; that the mines of the Fucares, of Almaden, of Almadenejos, indicate the rich parts of this system, in which the fissure followed momentarily the same direction as the strata, with all the inflections which present this direction.

We have endeavored, in the lines which precede, to describe with care the veins of Almaden, the rocks which accompany them, the strata in which they are encased. We have been able to conclude from this study, if not with an entire certainty, at least with a great probability, the approximate age of these deposits. Sundry questions remain doubtful; it would be very interesting, for instance, to arrive at a knowledge of the nature of the emanations which have produced the filling of the veins, and to explain what causes have been able to remove quartzite and to replace it by cinnabar. We leave to others the task of making this clear.

SECOND PART.

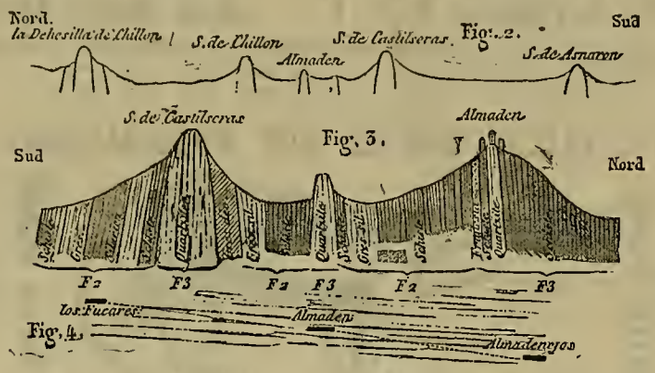
I.—Method of Exploitation.

The actual works of Almaden communicate with the surface by three vertical shafts known under the names of San Miguel, at the eastern extremity, San Aquilino, at the western, and between the two the San Teodoro, which without occupying a mean position cannot but be well placed as a shaft for hoisting and pumping. It is in the vicinity of this last shaft that one finds at different levels deposits of ore and material, as well as the reservoirs for the subterranean waters. Of the three shafts, that of San Teodoro descends to 305 meters, 17 meters consequently below the actual level of the deepest work for exploitation (288 meters). San Miguel descends only to 16 meters, and San Aquilino only to 5 meters below the level of the 9th level. The three shafts communicate with each other and with the deposits, by drifts run both in the sterile rock and in the ore itself.

The distance which separates the levels, one from the other, is now fixed at 25 meters, in spite of the fact that the upper levels often deviate from this figure. The distances apart of these levels are as follows:

1st level	44.80 meters
2d "	29.50 "
3d "	29.03 "
4th "	37.41 "
5th "	29.03 "
6th "	21.10 "
7th "	23.46 "
8th "	22.61 "
9th "	25.91 "
10th "	25.03 "
Total	288.63 "

The method of exploitation actually employed at Almaden was invented by the engineer Don Diego Larranga, and after a lively opposition, finally adopted toward the end of the year 1804. Although it has been already described, *e. g.*, in the treatise of M. Comces, we believe in order to be complete it should not be passed over entirely in silence. We would remark that its essential characteristic is the employment of masonry for sustaining the walls. From the beginning of the last century, under the direction of some German engineers, they had begun to substitute arches of masonry for those of wood which had been hitherto employed. The increasing difficulty of procuring timber of sufficient length on account of the increasing width of the veins, and some accidents which it was feared would some time occur to the whole mine, absolutely obliged recourse to some more efficacious method



ALMADEN QUICKSILVER MINES.

of preserving the workings than had been previously in use. The method of exploitation adopted is in short a method of filling or embanking across the excavated vein, *(une methode en traverse arec remblais).* It presents only two essential particulars:

First—That, far from waiting for the completion of an excavation before attacking the following, they pass to the opposite extreme, removing all the parts of different excavations which correspond vertically, by pits which run from one level to the other, before passing to an adjoining position.

Second—That the filling in is only partly done with stones and bricks taken from outside the mine.

The preparatory works consist of a drift, which, leaving the shaft of San Teodoro runs cutting the deposits on the level on which one wishes to establish the works, and in different adits, or interior shafts, which descend from the drift on the level above to the lower one which is being worked. The crosscuts *(travers-bancs)*, destined for the transport of ore and materials, should have large dimensions, particularly in the neighborhood of the shafts. The adits are opened out to a width of two meters and a length of 3 meters, parallel to the direction of the vein.

They intend to modify, at the 10th level, the method of laying out the tracks till now in use, in the manner indicated in the plan which we have reproduced in Fig. 15. In place of establishing a trackway at each level in each vein, they will place one in the middle of the massive sterile rock which separates the two groups. To the right of each of these future shafts, at spaces of 40 meters, will be established crosscuts. The drifts run in the midst of the vein will then serve only in a restricted measure for transportation; their maintenance (in repair) will then be less costly; the work in the labores having become more free, will be more easy, at the same time that transporation will have become more regular.

To give more clearness to this explanation, we will suppose the work to be divided into three periods quite distinct, except, indeed, that practically the three periods often encroach the one upon the other.

1st Period—Removal of the central zone of the vein.

2d Period—Removal, crosswise (*en travers*), of alternating columns of ore from either side of the central zone, thus leaving other columns intact, as "reserves."

3d Period—Removal of these "reserves."

First Period—When the shafts opened in the center of the mass have arrived at a certain depth, 10 or 12 meters for example, they begin to excavate from the shaft drifts two meters bigh, and one and a half to two meters wide; more exactly, they give to these drifts the width of the preparatory shaft, itself a little variable. New drifts are begun before these are finished, and they continue to explore all the central mass comprised between the two shafts, without attending to whether they reach the lower level; the removal of the central mass begins then by straight steps (*gradins droits*).

When the communication of the drift with the lower level has been established by the shafts, they actively exploit the ore by reversed steps *(gradins renverse)*, following as the first the central part of the vein. As the drifts and the steps are advanced, the surfaces of the two lateral zones laid bare is augmented of course, and they are sustained by strong props of oak, or of holly, upon which are placed boards when they wish to establish a passage *(encamacion.)*

The distance for placing these props varies with the greater or less inclination of the beds or strata, into which the bed of cinnabar divides itself. In cases where they seem to be insufficient, an arch of ore is left to maintain the two lateral walls more effectively than simple props, *(buttes.)* In cases when lastly, neither timber of large dimensions or arches of ore, appear to offer a sufficient security, provisional arches of brick masonry are constructed, abutting on each side upon the ore, and covered above with large stones to the hight of ten meters, to protect it against ruption from lateral pressure, which tends to expel the key-stone.

They are thus enabled, thanks to the relative solidity of the ore, to remove entirely all the central part of the vein, which is simply replaced by props *(buttes)*, supporting in some places stages, until in this way the shafts from which work was started are connected. The distance which separates two of these shafts is always 25 meters, as far as the 9th level. Between the 9th and 10th, the actual distance is 40 meters.

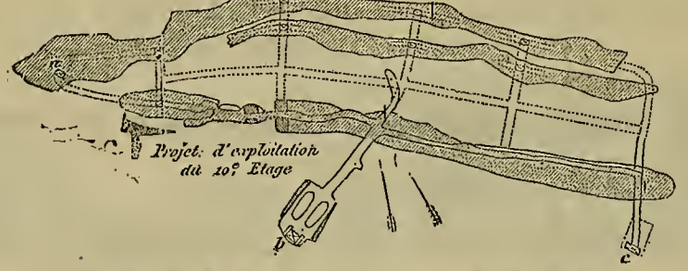


FIG. 15. PROJECTED EXPLOITATION OF TENTH LEVEL.

The necessity of a more rapid exploitation,

NEVADA OVAL TOP RETORT.

and above all the rapid construction of permanent works for supporting the mine, oblige the habitual commencement in every extensive labore of the second period, before the actual completion of the first.

OUR trade with New Zealand is growing.

New Publications.

A PRACTICAL TREATISE ON CASTING AND FOUNDING, including Descriptions of the Modern Machinery Employed in the Art. By N. E. Sprstson, Engineer. Published by E. & F. N. Spon, 46 Charing Cross, London, and 446 Broome Street, New York. For sale by A. Roman & Co., San Francisco.

Numerous valuable works have been written on the reduction of ores, the theory of the blast furnace, chemical considerations affecting the treatment and manufacture of iron and steel; copper, tin, and silver smelting, are all fully described, but molding and founding appear to have been comparatively neglected. The object of the work before us has been to collect in one volume, every subject on which it is probable that a founder will require information, whatever the material he deals with, and to place that information before him clearly, concisely, and in as practical a manner as the subject will allow. This object, avowed in the introduction, has been accomplished, if we may judge from a hasty examination of the book. In its completeness of detail it is eminently a book for practical men. A founder will find it a guide in the choice of materials and of apparatus. It takes up first the characteristics and mixtures of pig iron. It considers the subject of fuel, and enters into detail with regard to different furnaces. There are chapters upon pyrometers and thermometers; refractory materials; crucibles; blast machines; patterns; molding; general and special; chill-casting; case-hardening; casting on to other metals; drying-stoves; foundry-pits; crane-ladles; foundry-cranes; cast-steel; brass-founding; bronze statue-founding; bell-founding; cleaning and dressing castings; examples of foundries. The whole is fully illustrated.

The book though specially adapted to the needs of practical men, contains much that is interesting to the general reader. The student of the relations between theoretical and applied science, is attracted by the dependence of the forms of casting upon the laws of crystallization of cooling metals. It is interesting to learn that the curves in a great gun or in a heavy pump casting, are not the product of the founder's fancy only, but result from his knowledge of the internal constitution of the iron. In this connection Spretson quotes from Mallet: "It is a law of the molecular aggregation of crystalline solids that when their particles consolidate under the influence of heat in motion, their crystals arrange and group themselves with their principal axes in lines perpendicular to the cooling or heating surfaces of the solid, that is, in the direction of the heat-wave in motion, which is the direction of least pressure within the mass." When the crystals are small, and lie with their principal axes parallel, then they form the most compact structure. But suppose a sharp corner in a casting while it is cooling; the heat-wave passes off at both surfaces. Many crystals point their principal axes in a direction perpendicular to each surface. They no longer lie side by side, but become confused, and a weak place is formed in the casting. Again, the quicker the cooling, the smaller the crystals and the more compact the metal; an application of what the tyro in chemistry studies with a little sand-crucible full of melted sulphur. Other illustrations of this dependence of practice upon theory might be drawn from or suggested by this book.

In his chapter on "Examples of Foundries, Cost of Molding and Casting," Spretson advocates that careful keeping of accounts, which is so necessary to the economical conduct of any business but which is so frequently neglected especially in metallurgical and like works. When less metal comes out in a casting than was put in, the loss should be carefully investigated and accounted for. The man in charge should be as much exercised over a loss of this kind as should the chief assayer in a large reduction works when he finds the furnaces yielding below the assays. Care and economy, in the interest of business success and of science, are advocated now by all technical men. In some branches, these men are in this respect far ahead of the age. Few listen to them now. Their advice will be appreciated by another generation.

A New Form of Retort.

We illustrate herewith the "Nevada Oval-Top Retort," a new form of retort being introduced by Dunham, Carrigan & Co., of this city. The advantage of this retort over the old flat pattern is, that it can be filled full of amalgam, thereby holding more than the old style, besides avoiding all danger of an explosion, owing to the crown space in the cover which allows for the expansion. They are made extra heavy, well ground in the joints, and are furnished with a strong Norway clamp, having a wrought-iron key, which can be driven in or out of place by a single stroke of a hammer. The annoying thumb-screws are entirely done away with. Several sizes of these retorts are kept on hand, holding from 12½ to 125 pounds of amalgam. The retorts are very strongly made, and any mill man can see for himself the advantages of the form as shown in the engraving.

DURING the past month more quicksilver has been taken from the Napa Con. mine than during any other month since the mine was first opened.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME St., N.E. Cor. Pine, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The sbrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in hriuging valuable inveutions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with tbe assistance of co-operative agents, claims in all foreign countries whicb grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemhurg, New Zealand, New Soutb Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Repuhlic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with tbe requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in tbe Pacific States from two to six months (according to the location of tbe country) SOONER than any other agents.

The principal portion of tbe patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered bere than any other agents.

Situated so remote from tbe seat of government, delays are even more dangerous to tbe inventors of tbe Pacific Coast than to applicants in tbe Eastern States. Valuable patents may be lost by extra time consumed in transmitting specificatious from Eastern agencies back to this coast for the signature of tbe inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confideutial by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with tbe character of most of the inventions already patented; bence we are frequently able to save our patrous the cost of a fruitless application by pointiug to them tbe same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite tbe acquaintance of all parties connected with inventious and pateut right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assigiuees of patents or purchasers of patented articles, can often receive advice of importauce to them from a short call at our office.

Remittances of money, made by individual inventors to tbe Government, sometimes miscarry, and it bas repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We bave superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

FRED. M. PATRICK, Manager.

A GOLD MEDAL

Has been awarded at the Paris Exhibition of 1878 to

CLARK'S

O. N. T.

Best SIX CORD SPOOL COTTON. It i celebrated for being STRONG, ELASTIC, and of UNIFORM STRENGTH. It hae been awarded MEDALS at the great Expositions, from the first at Paris, in 1855, to the Centennial at Philadelphia in 1876. In this country CLARK'S O. N. T. SPOOL COTTON is widely known in all sections for its Superior Excellence in Machine and Hand Sewing. Their Mills at Newark, N. J., and Paisley, Scotland, are the largest and most complete in the world. The entire process of manufacture is conducted under the most complete and careful supervision, and they claim for their American production at least an equal merit to that produced in Paisley Mills. As

NO GRAND PRIZES were awarded at Paris for SPOOL Cotton,

They are glad to announce to the American Public that they have been awarded a GOLD MEDAL, being the higheet award given for Six-Cord Spool Cotton.

Geo. A. Clark & Brother,

KING ENGINE.

The Only SAFE BOILER.

SAVES One-half the FUEL Consumed by Others.

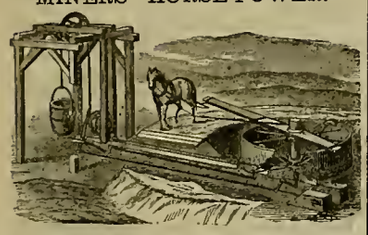
The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,

18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

507 Mechanical Movements.

Every mechanic Should have a copy of Brown's 507 Mechanical Movements, illustrated and described. Inventors, model makers and amateur mechanics and students, will find the work valuable far beyond its cost. Sold by DEWEY & Co., Patent Agents and publishers of MINING AND SCIENTIFIC PRESS, San Francisco. Price, $1, (post paid.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

No. 603 Washington street, San Francisco, Cal.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the lights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

Continued from page 309.

which includes the Prescott, Heuston and King's Hill.

KING'S HILL.—On the Orleans property, is being worked by Beau & Ryan. Last week they had a good cleau-up from 35 loads of rock.

JUDD & CASEY GROUND.—Is situated on Ben Franklin hill. A crushing of 30 loads of rock has heen finished at the Allison Ranch mill, which yielded about $1,800 or $60 to the load. The ledge is still 18 inches wide.

PILLOW & CRASE.—Have taken up the gravel mine formerly known as the Jenny Lind, situated on Alta hill, west of the Godfrey mine. They feel confident that they are on the channel.

SILVER STAR.—This ground, west of Scaddeu's Flat, has been sold by Joseph McCauley to Joseph Winn for a very valuable consideration.

NORTH STAR.—Is being worked on tribute, Mr. James Bays being chief contractor; many rich deposits of ore have been extracted from this mine.

BRANCH & Co.—Have leased ground from Watt & Judd on Gold hill; their shaft is about — feet in depth, and they have a good ledge, which shows free gold.

SHAMROCK.—Situated at Forest Springs, is working a crushing of 20 loads at the Allison Ranch mill. The owners feel confident that they have a good mine.

PLACER.

CISCO COMING TO LIFE.—Dutch Flat *Forum*, Nov. 7: From recent tests made (through new processes) of the rebellious ore taken from Meadow Lake district, it is claimed to be demonstrated beyond a doubt that those exteusive ledges cau he made pay well for the working. As easy access to Meadow Lake can be had by way of Cisco, the latter place, of course, bids fair to reap large benefits from the travel and freight shipped from this point. Still she has other hopes. A large amount of float hase metal is found on Red Mountain, north and less than three miles from the station. Mr. Camphell, who keeps a store of general merchandise at tbis place, gathered and had a carload of the metal shipped below, receiving $40 per ton for the same.

MICHIGAN BLUFFS. — *Argus*, Nov. 9: A short time ago two tons of rock from the Old Bird valley lead yielded $75 per ton. Since then five tons more of quartz rock were taken out of the mine, which is now called the Centennial Quartz Lead, and it averaged about $80 per ton. This success has naturally caused something of a flutter among local mining experts, and Messrs. Knoufel & Slifer have located an extension of the claim. The prospect of obtaining good pay is very favorahle, gold heing freely seen in the rock. This extension is about a thousand yards south of the Centennial.

PLUMAS.

A RICH GRAVEL RANGE.—Quincy *National*, Nov. 9: Chaparral hill is situated upon what promises to he the richest gravel range yet discovered in northern California. It has already heen traced for a distance of perhaps 40 miles, and it traverses this county for twenty miles, running in a southwest and northeasterly direction. The mines previously located upon this famous channel of auriferous deposits are the Gopher Hill, Badger Hill, Hungarian, Clermont and Golden Enterprise, all of which are in successful operation. It is also apparent that Rich Bar, Rich Gulch, Golden Canyon, Lucky Strike, Home Stretch and other old mining camps of this county, which yielded almost fabulous wealth, were all fed from this immense gravel helt. The property claimed in the Chaparral hill survey has the formation of an immense hasin of gravel about one mile square.

TWENTY-TWO FEET OF ORE.—The Savercool Co. have now a good five stamp mill running on good paying rock, and the lode where they are working is 22 feet in width, nearly all of which is good ore. The only drawhack is the fact that they have to haul their ore ahout a mile and a half, which may interfere somewhat with the work during a portion of the winter. It is reported that two other ledges have been lately discovered by W. S. Dean, near the Savercool mine, which give some fine prospects on the surface.

NEVADA.

WASHOE DISTRICT.

CALIFORNIA.—Gold Hill *News*, Nov. 13: The daily yield of ore has heen increased to 300 tons per day, which keeps the Consolidated hattery mill and the California pan mill still busy crushing. There is no change of value to report of any of the ore-producing sections of the mine.

SIERRA NEVADA.—At the 2200 level two drifts have been started at the station, one northward and the other southward. The south drift is intended for the crosscut or main working drift through the ore vein now heing gradually turned to reach the ore vein, which it will in all probability do in three days more. The north drift will he louger in reaching the ore. Everything is working well.

CON. VIRGINIA.—Daily yield of ore, 140 tons. It is likely that even tbis small amount of ore extracted will be greatly decreased during the month to come. The main south drift on the 1950 level is heing steadily advanced, the face in quartz and low grade ore mixed with streaks of porphyry. It is now in 410 feet from the Califoruia line. The principal work on the 1850 and 1750 levels is the enlargement of the winzes and drifts, so as to keep good the circulation of air. But three men are now employed to the shift on each of these levels. Enlarging the main east and west drift on the 1650 level, connecting the C. & C. and Consolidated shaft, is making good progress. Enlarging crosscut No. 2 and the southwest drift from the C. & C. drift on the 1500 level is making steady headway. The main east drift on the 1400 level is also being repaired. The southeast drifts on the ore streaks from the south end of the ore stopes on the 1300 level is making good progress, the face still showing small veins of good ore. Sinking the C. & C. shaft is going steadily forward.

GOULD & CURRY.—Sinking the new Best & Belcher joint shaft is making good progress, the hottom in good blasting ground. On the 1900 level crosscut No. 4 from the bottom of the joint winze is steadily advancing. Crosscut No. 2 on the same level is also making good progress, the face in blasting porphyry.

BEST & BELCHER.—The south drift from the joint Con. Virginia winze on the 1,900 level is making slow progress on account of the great heat. Good ventilation of the entire level will be attained in a day or two more.

JULIA CON.—The south lateral drift on the 2000 level is being pushed, the face affording low assays. A large drain for the water is being cut underneath the car track in this drift. This will have the effect of greatly cooling off the entire 2000 level, as the drain will be covered close so that the hot steam cannot escape. By this arrangement the heat has already been decreased some 12 degrees.

NORTH CON. VIRGINIA.—Over 200 men are employed in grading, laying the heavy stone fonndations, framing the timbers for the hoisting frame and building, and in sinking the main shaft. Sinking the main shaft progresses.

CALEDONIA.—The east crosscut on the 1600 level during the first part of the week cut a strong flow of water, which was, however, only a pocket.

UTAH.—Sinking the main incline is going vigorously forward, the bottom still in good sinking ground. The new boilers are heing put in place, and the frame work of the new building is about complete.

ALTA.—The face of the north drift on the 1550 level shows signs of a near approach to the ore chimney recently sunk upon by the winze below the 1450 level. The face of the drift is showing some good ore, which bids fair to open out a large and valuable deposit. The bottom of the winze below the 1450 level is in good ore.

SILVER HILL.—Sinking the main incline preparatory to opening the 1100 station is making good progress. The south drift on the 800 level is now heing advanced in St. Louis ground. The south drift on the 900 level is steadily advancing, the face in a favorable vein formation.

YELLOW JACKET.—The south drift on the 2400 level has passed through considerahle quartz, and the face is now in ledge porphyry.

BULLION.—The oast side of the shaft is cutting into a fine quartz formation which is liahle to make into ore at any time. Opening the 2050 station is being pushed ahead energetically, to prospect the ore vein to the eastward at that point. Work has heen resnmed in the west crosscut on the 2000 level, which is heing pushed to prospect the ore vein and connect with the main incline for air purposes.

OPHIR.—No work has heen done in the east crosscut on the 2100 level during the week, at which point the flow of water from the drill hole continues quite strong. The north drift on the 2000 level is being pushed, the face still in eoft vein material showing great regularity, and carrying occasional streaks of quartz and small veins of low grade ore.

JUSTICE.—The prospecting drifts north on the 1300 level are opening up a splendid prospect of good ore. The south drift on the 1450 level of the Alta is showing good ore. Negotiations are pending for the leasing of the Devilsgate and Pioneer mills with which to crush the ore.

TROJAN.—Both the main northeast drift and the west crosscut on the third station level are advancing in low grade ore. The ore stopes on the second station level yield the usual quantity of good ore.

HALE & NORCROSS.—The pumps are again lowering the water. The east drift on the 2000 level is heing rapidly advanced.

CROWN POINT.—There is no change of value to note of any of the prospecting drifts on the 2300 levels. Work progressing well at all points.

MEXICAN.—The joint Union Con. winze is making fair progress. The flow of water from the Union Con. drift gives no further trouble.

OVERMAN.—At the old mine the east drift on the 1600 level, which is being run in order to reach a point far enough east to sink a winze to the 1800 level, is making good headway. The north drift on the same level is heing driven vigorously ahead.

BELCHER.—Sinking the main north incline shaft below the 2460 level is making good progress. The 2560 level will soon be reached, when a new prospecting station will he opened.

UNION CON.—Men are engaged in cleaning out and repairing the main drift on the 1600 level, preparatory to resuming work at the point where the water was struck. It is more than likely that when the drift is again advanced a quartz vein will he encountered.

SAVAGE.—The station at the bottom of the north winze below the 2000 level is completed and a crosscut started to prospect the ore vein at that point.

SOLID SILVER.—The crosscut east from the main tunnel has ahout 20 feet further to the east ledge. Preparations are making to supply the requisite air in drifting from the bottom of the winze to the west ledge.

COLORADO.

RIVALS FOR LEADVILLE.—Denver *Tribune*, Nov. 6: Carbonates have been found on Four-Mile creek, Boulder county. The first reports came from Left-Hand. The prospectors then hranched out into new fields, and began operations on Four-Mile creek. The hunt was successful. The pick of the prospector had been stuck into hut few places when the carbonate was found—even richer than that taken from Left-Hand. Assays made showed the surface ore to run all the way from 60 to 450 ounces to the ton. The ore is of the same character as that found at Leadville. There is no difficulty in mining it, and, like the Leadville ore, it is easily worked—almost pure gain. It can be taken out very rapidly, and, at 450 ounces to the ton, a few tons are a fortune.

RIVALS FOR SILVER CLIFF.—On Oct. 27th it became known to a few that near the head of Sacramento gulch, neighborhood of Alma and Fairplay, Park county, some rich discoveries had been made by Messrs. Toble, Dweller, Birdsall, La Duc and Mullen. The spread of the news has caused the usual rush. For a while discoveries were confined to the above claims. But later mineral was struck on two claims, owned respectively hy Dennis Findley and William P. Cook. The ore thus far found resembles the mineral of Mounts Bross and Lincoln, and as it occurs in the same mountain system, viz: the Mosquito range, and in the same geological formation, a contact hetween porphyry and lime. The ore thus far discovered is of uniformly high grade, not a single assay of less than 100 ounces having been made from any sample taken, while many have exceeded 500 ounces. No mill run has yet been had, but the Sacramento lode will ship to-morrow a two-ton lot, taken out in sinking their discovery shaft, which is only down at present about seven feet. The owners expect this lot to average over 200 ounces. The camp has every advantage of location, being below timber line and surrounded on all sides, and above and below by dense forests of heavy pine. A town site has been surveyed. The new place has been christened Carbonate City.

OREGON.

PERMANENT AND EXTENSIVE.—*Oregonian*, Nov. 4: It is established heyond a douht that the mines of Granite creek, Grant county, are permanent and extensive. The Monumental has 300 tons on the dump and 4,000 in sight. The Phil. Sheridan, at a depth of 36 feet, showed a 1½-foot ledge, assaying as high as $500 per ton. A rich discovery has just been made about half a mile north of Sheridan.

HYDRAULIC MINES.—*Sentinel*, Nov. 6: The Josephine mine is now ready to commence piping. Two giants will he used. Certain Portland capitalists have purchased mining property and several water rights and ditches in the vicinity of Willow Springs. They expect to put in about 1,500 feet of pipe this season. Al. McKenzie is Superintendent.

GOOD YIELD.—Dan Fisher last week completed the crushing of 1,500 pounds of rock taken from the mines of the Fort Lane Quartz Co., and realized $216 in gold. This company has some 50 or 60 tons of the same rock in sight, and they are now talking of huilding another arastra for crushing it. They also have some placer mines adjoining, and are now making preparations for working them this winter. Thos. Kahler is Superintendent of these mines.

UTAH.

BINGHAM.—Salt Lake *Tribune*, Nov. 10: It is estimated that from 50 to 60 tons will be daily put through the Stewart mine mill, when the whole number of stamps get to work. The Steamhoat is working four men prospecting. The Last Chance has closed down and will not resume operations hefore spring. The Alameda, working on lease, is turning out some high grade ore. The St. John is leased to Martin & Co. and looks well. The Miller is under lease to A. Lawson & Co. They have out some eight tons of fair ore. The Wall Street has heen leased to W. Hoskins and considerahle prospecting has heen done. The Jordan is as usual turning out her quota of ore and keeps the tramway cars husy-in taking it to the concentrating works of Prof. Holden at the Jordan. The Mayflower has reduced her staff ahout half. Hanson & Janson have out ahout 40 tons of first-class concentrated ore, which they prefer to keep rather than sell at sacrifice. The Atalanta is looking but indifferent. The present indications of ore look dnhious. The Clipper owned hy Mr. Couch, is looking first-rate. The Flag in Muddy is working a force of three men, and the ore now heing taken out assays well. The Orphan Boy and Utah are still idle. The Shettle hoys have closed down their leaching works on the Northern Light, the weather having become too cold for further operations. I. G. Eastman has a lease on the Lone Pine, and a tunnel is heing run to tap the ledge. A little ore is in sight of high grade. The late decline in the ore market affects the camp much.

BEAVER.—Salt Lake *Tribune:* The Frisco smelter is running full hlast, and turning out the usual amount of hullion every 24 hours. Cullen, Camphell & Co. have their refining works at Chicago, and are enahled to refine their own bullion.

THE capital of the Sierra Nevada M. Co. is to he increased from $10,000,000 in 100,000 shares, to $50,000,000 in 500,000 shares.

FIFTY thousand eucalyptus trees are to be planted ahout the City of Mexico, and it is expected they will cause a very material modification of the rainfall ahout the Mexican capital.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch from Washington, D. C.

For the Week Ending October 29th, 1878.

Bush Inserters—Geo. H. Mixer, S. F.

Combined Knife and Match Safe—John G. Rahner, Portland, Oregon.

Grain Spouts—John Scholl, Elk Grove, Cal.

Band Saw Guides—Joseph A. Wells, Oakland, Cal.

Hot Atmosphere and Medicated Baths—Geo. M. Baronidis, S. F.

Pumping Apparatus for Raising Water—Francis A. Bishop, S. F.

Cigars and Cigarettes—Trademark—Harris Bros., S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Band-Saw Guide.—J. A. Wells, Oakland, Dated, Oct. 29th. This invention relates to an improved guide for band-saws, and the improvements consist in mounting on journals, on a plate which is suitably secured to the guide stem, a pair of rollers or wheels between which the saw passes and which serve to guide it, said rollers or wheels being provided with flanges or extended rims at the back which prevent the saw from being pushed from between the wheels when at work. The rollers or wheels are so arranged as to be adjustable to saws of varying thickness or widths. This device reduces the friction on guides for hand-saws to a minimum. It may be secured to the guide stem of any of the machines now in use. The peculiar formation of the pulleys with their rear flanged disks is such as to render it impossible for the saw to get out from its proper position between the wheels. Pressure on the cutting edge of the saw, even in the case of sawing heavy blocks, does not materially increase the running friction, since instead of the rear edge of the saw pushing against a solid piece of metal, firmly fixed, it impinges on a surface revolving in the direction of its line of travel at an exactly proportionate rate of speed. The friction on the sides of the blade is nominal, since the surfaces on which they impinge are running in the same line of travel and at a rate of speed exactly corresponding to that of the blade.

Knife, Match Safe and Tape Measure.—J. G. Rahner, Portland, Oregon.—Dated October 29th. The device forms a combined pocket knife and match safe, and consists in making a case or safe with a movable hinged cover, in which safe matches, pins, toothpicks and similar articles may be carried. On the inside of the cover is secured a tape line, which is wound around a staple provided for it and secured in place by a rubber hand. On the side of the case is a penknife blade, having the usual guard—the whole device being made of the size of an ordinary pocket-knife.

Grain Sacking Device.—John Scholl, Elk Grove, Sacramento county. The object of the invention is to provide a device for the continuous sacking of grain as it passes from a threshing machine and separator, without interruption while substituting empty for full sacks, and without the loss of grain which usually occurs during such a change. It consists of a chute, or spout, through which the grain can flow, and which is provided with an outwardly flowing diaphragm; just at the mouth, so that the chute is divided into two outlets at this point. Each of these passages is provided with an independent set of hooks for holding the sacks, and the chute has a gate made to move across its width just back of the diaphragm, so as to stop either of the passages alternately. A lever passes through the covered top of the chute and operates the gate. While one sack is being filled, the flow of grain is cut off from the other half, and an empty sack can easily be adjusted to the other side. When the first sack is full, the flow is diverted to the empty sack without wasting a grain, and time is allowed for removing the full sack and replacing it by an empty one.

Fresh attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

For Printing Materials, the publishers of this paper patronize Marder, Luse & Co., Pacific Type Foundry and Printers' Supply Warehouse, 532 Clay street, San Francisco, Cal. Send them a stamp for specimen sheet, and say advertised in this paper.

Examine the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

Model Maker and Machinist.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

Messrs. Dewey & Co.—*Gentlemen:* I received the Letters Patent for my invention on the 5th inst., and beg to thank you for the gentlemanly and business-like manner in which you have dealt with me from the beginning of my application. I shall always feel it a pleasure to recommend you to all I come in contact with who need Letters Patent. Respectfully, Wm. Dale.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

General Robert Allen Silver Mining Company.

—Location of principal place of business, San Francisco, California. Location of works, Pinal County, Arizona.

Notice is hereby given that at a meeting of the Board of Directors, held on the 29th day of October, 1878, an assessment of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the 30th day of December, A. D., 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the second day of January, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

M. C. SOUTHARD, Sec'y.

Office, No. 411½ California street, Room 11, San Francisco, California.

Land Purchasers' Association.—Location

of principal place of business, San Francisco, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1878, an assessment of four ($4) dollars per share (being a part of the $30 installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at No. 641 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Saturday, the fourth (4th) day of January, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

O. S. WRIGHT, Sec'y.

No. 641 Sacramento St., San Francisco, Cal.

Mineral Fork Mining and Smelting Company.

—Location of principal place of business, San Francisco, California. Location of works: Big Cottonwood District, Salt Lake County, Utah Territory.

Notice is hereby given, that at a meeting of the Directors held on the 31st day of October, 1878, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 20, Safe Deposit Building, No. 328 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventh day of December, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 30th day of December, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

OTTO METCHKE, Sec'y.

Office, Room 20, Safe Deposit Building, No. 328 Montgomery street, San Francisco, Cal.

Mount Jefferson Milling and Mining Co.—

Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1878, an assessment (No. 5) of five (5c.) cents per share was levied upon capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 318 Pine St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fifth (25th) day of November, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the seventeenth (17th) day of December, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine St., San Francisco Cal.

New Basel Con. Gravel Mining Company.

—Location of principal place of business, San Francisco, California. Location of works: Placer County, Cal.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 4) levied on the 24th day of September 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
G Mahe	6061	1500	$75 00

And in accordance with law and an order of the Board of Directors made on the 24th day of September, 1878, so many shares as may be necessary of each parcel of such stock will be sold at public auction at my office, rooms 5 and 0, No. 434 California street, San Francisco, California on the Eighteenth (18th) day of November, 1878, at the hour of twelve o'clock, noon, of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

D. F. LeGAYE, Sec'y.

Office, 434 California St., San Francisco, California.

Summit Mining Company.—Location of

Principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5,) levied on the 10th day of September, A. D., 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
C Lehmann, Trustee	200	5	$ 25
C Lehmann, Trustee	201	5	25
C Lehmann, Trustee	202	5	25

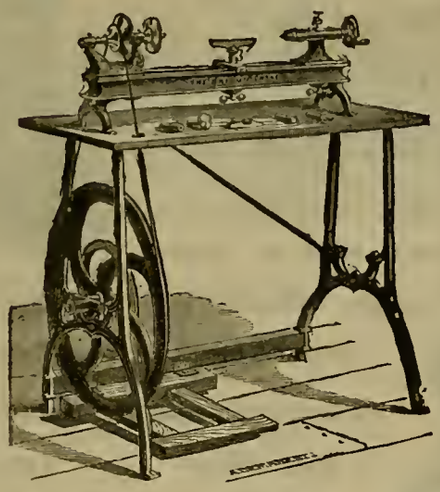
THE BRIGGS LATHE.

Combines Superior Excellence in Quality and Finish with Beauty, Strength and Completeness.



This Lathe will turn a piece of Wood or Metal 12 inches long and 6 inches in diameter.

It can be used with equal advantage for Drilling, Polishing, Sawing, etc. The length of bed is 24 inches; the spindle is made of steel, has a conical bearing, and can be tightened as it wears. The bed, head, tail-stocks and cone-pulley are of cast iron and the centers of steel. The following pieces are furnished with the lathe: 2 T rests, 1 face-plate, 2 plain centers, 1 spur center for wood, 1 plain drill-chuck, 1 drill-pad, and 1 center left blank to turn down as a fitting for a universal chuck. The bench weighs 81 pounds, is made of iron, with a black walnut top, and has a driving-wheel measuring 22 inches in diameter, with three grooves for changes of speed.

PRICE OF LATHE, AS ABOVE, $25.

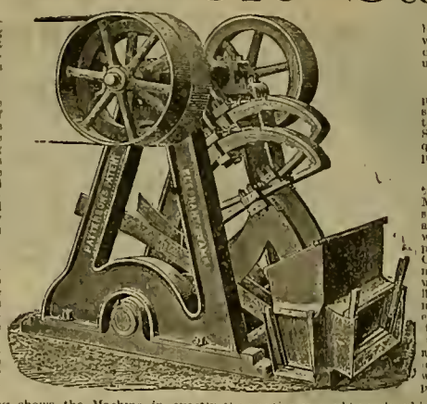
To be obtained of CROSS & CO., San Francisco.

Elephant Ore Stamp.

We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12 Stamp Battery of the present system, having crushed as high as 1¼ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-



brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Caribou and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco. For particulars, apply to

EDMUND WHITE, Care of A. B. Grogan, 705 Sansome St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, NOVEMBER 23, 1878.

VOLUME XXXVII Number 21.

An Improved Hydrant Suction.

A patent has been secured, through the MINING AND SCIENTIFIC PRESS Patent Agency, by James Stoddard, for a hydrant suction, which is a great improvement over those formerly in use. A "hydrant suction" is the pipe or hose connecting a steam fire-engine with the hydrant, and they have until now been made of a rubber and canvas hose, inside of which was a spiral coil, to prevent collapse. This style of suction is heavy, apt to collapse, and soon wears out, and it has remained for a member of the San Francisco fire department to invent a device which will take its place by answering the purpose better in all respects.

The engravings show pretty clearly the construction of the device, which is extremely simple in use. At one end is the usual coupling, or collar, having studs by which it is screwed on to the engine suction-pipe by a spanner. This collar fits loosely on to the neck of the outer half of the ball or flange, in the neck holding it in place, and a washer, preventing leakage. The ball, of which this neck is part, as shown in the sectional view, is formed in two parts, which screw together at the center. Inside of the inner half ball fits a hemispherical plate, having a projecting neck or pipe, with screw threads both on the inner and outer surface. This hemispherical plate has a washer of corresponding shape, so that the plate will fit closely to the ball, and the neck projects outward through an opening in the hall, somewhat larger than said neck, so that the ball may be revolved for a certain distance on the plate.

Over the projecting neck or pipe is slipped a cap, which encircles the outer surface of the half ball. Behind this is screwed on the pipe a collar, having lugs, by which it is screwed up. The ball may revolve for a certain distance on the plate, between the plate and cap; but by screwing up the collar it presses the cap tightly against the outer surface of the hall, and at the same time draws the inner plate back firmly against the inner surface of said ball, thus closing the joints tightly, and preventing the hall from turning.

A sleeve, having screw threads formed on its outer surface at both ends, is screwed into the pipe connecting with the plate. On the other end of said sleeve, on its inner surface, is formed a shoulder. The telescopic pipe, which passes through this sleeve, has a flange formed on its end, so the pipe cannot be drawn out of the sleeve when once in position; and the joint between pipe and sleeve is tightened by the stuffing-box, as shown.

The telescopic pipe screws into the neck or projection of the opposite plate, said neck and pipe being connected with the hall-and-socket joint at that end precisely alike in every respect to that previously described.

These two hall-and-socket joints, with their connections, are united in the manner described by the telescopic pipe, which allows the distance between them to be lengthened or shortened, while connection is still maintained. The pipe may slide back and forth through the sleeve, and when in proper position, the stuffing box is screwed up and the joint made tight. When the telescopic pipe is pushed on or closed, the appliance occupies very little room, and may readily be carried on a fire-engine. On arriving at a fire, one coupling is screwed to the hydrant and the other to the suction pipe of the engine. While thus connecting the engine and hydrant, the balls may revolve freely in their sockets, and it is not necessary to have the engine directly in line with the hydrant opening, since the one on the engine will adjust itself off of the line sixteen inches or more, and that on the hydrant will accommodate itself to the other. The telescopic pipe adjusts itself, since, when drawing one coupling out after the other is screwed to the hydrant, the pipe will be drawn out to the proper length. When the connections are made the collars on both sides are screwed against the caps. This pushes the caps firmly against the balls, and draws the inner plates, with their washers, firmly against the inner surfaces of the balls, preventing the balls from turning and making tight joints.

This coupling can be connected and set firm in a short space of time. It is never in danger of collapse, as is the carbolized suction pipe. Being short while together, it can be more easily handled, and the telescopic pipe adjusts itself. Play enough is given to the ball and socket joint as described, so that no delay is necessary to adjust the engine with reference to the hydrant, and the connection is metallic, these hydrant suctions being made of brass.

The Stoddard patent suction has been in use in the San Francisco fire department, and its advantages over the common rubber suction have been in all respects realized. It weighs about 60 pounds, and from the fact of its being telescoped it can readily be handled and adjusted by one man, contracted or extended as the distance of the engine from hydrant may require. An easy flow of water from hydrant to engine is secured, as there are no bends or kinks. Being made of brass it will stand any pressure required, avoiding all loss of time from bursting suctions. Its parts are made in duplicate, so in case of any accident the whole suction need not be condemned. Any one with experience in fire matters can readily see the advantages of this new device, and experience has proved its value. The inventor Mr. Stoddard, is at the corporation yard, No. 50 Sacramento street, where this suction may be seen by those interested.

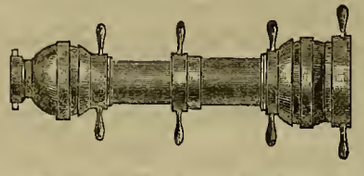

Fig. 2. Stoddard's Hydrant Suction.

GUIDE TO MONO COUNTY MINES.—Mr. Jos. Wasson has just published a complete guide to the Mono county mines, giving a description of Bodie, Esmeralda, Indian, Lake, Laurel Hill, Prescott and other mining districts, with maps and illustrations. It is a new edition of his work on Bodie and Esmeralda, containing much late and fuller information and a great deal of new matter on other districts. It is in pamphlet form. The object of the present publication, which is merely supplementary to the one in question, is to give a more complete description of the mining region of which Bodie is the chief center of attraction at present. Several new districts have been organized, and one or more old ones brought to the point which give promise of important results. These additional notes were gathered during a prospecting tour through Mono and Inyo counties, in July and August, and will be of great service to those contemplating a trip in that direction next spring. The little pamphlet is well written and the information given in condensed form. It is of great value to all mining men—either those interested in mines or stocks.

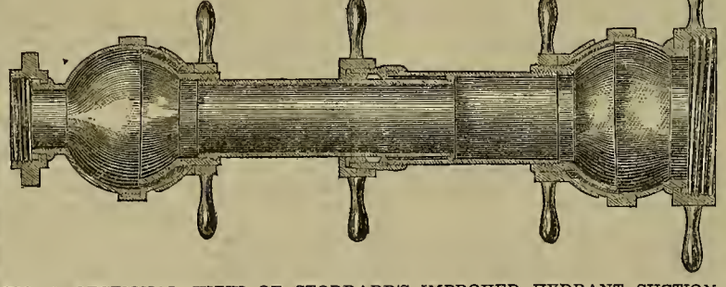

FIG. 1 SECTIONAL VIEW OF STODDARD'S IMPROVED HYDRANT SUCTION.

OF upwards of 200,000,000 persons carried on American steamers during the last year, only one person and one-tenth were lost in each million.

NORWICH, England, is inundated by a freshet of the river Wensum. Several persons drowned; 3,000 or 4,000 dwellings uninhabitable.

THE Stormont Co., of Silver Reef, Utah, are working 45 men on the Last Chance mine.

Lake District, Mono County.

We had an opportunity this week of conversing with Mr. A. Caldwell, who recently made an extended trip through the Mono county mines, and from him we gain some valuable information concerning Lake district, which will be of interest to our readers. The district is about sixty miles southeast of Bodie, on the eastern slope of the Sierras, or rather on a spur from those mountains running northerly. The district is approachable from the Maderia station of the S. P. R. R., distance 90 miles, of which 40 miles is made by stage, and the balance by trail. All the freight goes in now by way of Mohave and Bishop's Creek. Both water and wood are very abundant. Water power for mills is supplied from a chain of seven lakes lying west of the Mammoth mountain—the center of the district—between the main range and Mammoth mountain. There are thousands of acres of heavy pine timber in every direction. The eastern side of Mammoth mountain is about 1,200 feet above the valley, and a plateau on top slopes to the west, so that the western side is about 1,000 above the valley. The mountain is about three miles long and nearly as wide.

There are in the district at present between 500 and 600 men, most of whom are prospecting, some, however, working on the mines which are now being opened. Many more are expected when spring opens, and there is a better chance to work. There are two town sites laid out—one called Pine City and the other Mammoth City. The ores of the district are free milling, silver predominating, the rock, however, carrying some gold.

The district is a new one, having been opened within a year, yet there are several promising mines being opened with very good prospects. The most prominent of these is the Mammoth mine in which Gen. Dodge, Thos. Bell, Sol. Heydenfeldt, M. S. Latham and others are interested. Edward Clarke is Superintendent. The company own a series of mines, and the estimated width of the ledge matter in this one is 75 feet. The mine is worked at present by an open cut, but a tunnel has been started in at the foot of the mountain. At present, however, the ore is quarried out as in a stone quarry, from the open cut. The ore is slid down a chute of about 1,000 feet to the valley below, and thence carried by tramway for a quarter of a mile to the mill. The mill is a 30-stamp one, but only 20 stamps are in place; run by a Knight water wheel. They estimate 80,000 tons of ore already in sight. The Mammoth has milled 400 tons of ore since the mill started up, which has worked $30 per ton. The amount of bullion shipped to date, is about $10,000, of which 30% was gold, and 70% silver. The gold is worth $21, and the the silver runs 968 fine. The ore was worked up to 92% of the average assays, and the cost of milling and mining was $5 per ton.

The True Blue is another prominent mine of the district, and was recently incorporated with John Neate, as President; S. M. Holmes, Treasurer, and J. H. Sayre, Secretary. The ledge is over 30 feet wide and an average of ore assays shows an assay value of ore of $136 per ton, the lowest being $52.74, of which $47.72 was silver, and $5.02 gold. The ore can be mined and milled for $5 per ton. The mine is about 900 feet above the mill site, with a gradual descent to the mill, so that the facilities are good. The situation of the mine being so advantageous no very great expeditures will be needed to develop it, and the company contemplate the erection of a mill very shortly.

The Lake View is a series of four mines on the west side of the mountains, represented by Neate, Holmes and others, and has had assays from eight samples averaging $117. The Don Quixote in the same district is represented by Rutherford, Epstein & Co., and the North Star is another prominent location. The Alpha is one of the oldest locations, and has a bright future before it.

The ledges in the district are said to be very wide, but all the available ground has been located. Most of the work has been done by the Mammoth, that company having been largely instrumental in the development of the district.

There are several other districts in the neighborhood, Laurel Hill being only four miles distant, a district having good base metal prospects, but with nothing sufficiently developed as yet to determine value. Prescott is another new find of base metal, about 20 miles north of Lake.

The Quicksilver Furnace Litigation.

In our issue of the MINING AND SCIENTIFIC PRESS of February 12th, 1876, we noticed the "furnace litigation" between the patentees of the Knox & Osborne quicksilver furnace and the Great Western Quicksilver Mining Co. for infringement of patent, the case having at that time just been tried before a jury who fully sustained the patents of the plaintiffs and also found the defendants had infringed the same. These patents having been secured through the MINING AND SCIENTIFIC PRESS Patent Agency, we have felt considerable interest in following this case through its various phases to a final result. This seems now to be accomplished so far as the Circuit Court can go, by a decision rendered last Monday confirming the report of the Master in Chancery, and a judgment for $92,785 and costs of suit. In the article above referred to we said:

"This being the first attempt to sustain these patents, and there being some 15 or 20 furnaces built which are claimed as infringements, the case created great interest and was to some extent a combination of all the interested parties in the State to break the patents and thus end the possibility of claims against the other companies being made in the future. In the course of the trial, every furnace which was ever heard of, which was thought to contain any one of the devices of the Knox & Osborne furnace was brought forward and described by the experts who gave learned opinions on all the old furnaces and lime-kilns ever sketched in books or ever heard of, yet nothing was produced showing a continuous working quicksilver furnace until the Knox & Osborne furnace was built. * *"

"This may be regarded as a test case, having been very thoroughly and vigorously contested on both sides, and although there may be other suits embracing the same points of law as this, it is probable that the results of this one will be held conclusive."

The decision in this case last Monday confirms the opinion expressed by us nearly three years ago, and we have little doubt the Supreme Court of the United States will put the final confirmation upon this case, making it in fact conclusive. It is particularly gratifying to the managers of our Patent Agency to know that their work for their clients stands so thoroughly the test of the Courts, of which this case by no means furnishes the first example.

THE Jersey mine, Humboldt county, Nevada, is looking well.

THE Tower, Montana, mills are running steadily.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Artesian Wells in Stanislaus County.

EDITORS PRESS:—There are no flowing wells in Stanislaus county at present, but two are in progress. Much interest is manifested in wells all over the county, and as soon as water is struck in the first well nearly every land-owner will bore one. The soil and the general configuration of the country in Stanislaus county is very similar to that of Merced county, where there are so many flowing wells. Stanislaus has a soil and a climate that, with water, can raise every product in perfection.

The Rodgers Well.

Stephen Rodgers was the first man east of the San Joaquin river to attempt artesian well-boring. He commenced one in 1877, and penetrated to the depth of 386 feet, when the well was abandoned on account of insufficient tools. The well is on Mr. Rodgers' place, half a mile west of Paradise City, on the Tuolumne river. The strata encountered are as follows, viz.: Surface soil, sandy loam, 4 feet; hard-pan, 10 feet; sand with streaks of blue cement, 2 to 4 inches thick—running through it, 175 feet; water-worn gravel, apparently the bed of a stream or lake—stones the size of a pebble to the size of an egg, 3 feet; blue clay, under which water was found and rose to within 12 feet of the surface, 74 feet; sand, with thin strata of blue clay running through it, and in several places black sand, large mica scales all through the sand, 117 feet; blue sandstone, or cement, with gravel running through it, very hard, 3 feet. Here the boring stopped.

In the strata of blue clay was found wood and leaves very much decayed, the species unrecognizable. Mr. Rodgers will soon resume boring in this well, and believes a strong stream will be struck just below this last stratum of cemented gravel. A windmill is at present pumping water from the well. The water is rather strong mineral water, its medicinal properties very good; has been used with advantage by invalids of Modesto. Dr. Sherman, of Oakland, has made a partial analysis of this water, which he says contains lime, sulphur, a quantity of organic matter and carbonate of soda.

The Temple Well.

Ten miles south of the Rodgers well, is the Temple ranch on which an artesian well is being bored by Haas & Manning's steam well borer. A depth of 270 feet has been reached, and the work is temporarily delayed by the bending of the pipe at the bottom of the well. This well was commenced over a year ago at the suggestion of Mr. John Amos, formerly with Vanderslice & Co., of San Francisco, and at the recent decease of Mr. Temple, heir to the estate. The boring will be resumed as soon as the pipe can be sprung back. Strata of the well: Surface soil, 5 feet; hard-pan, 3 feet; sand with alternate layers of clay 2 inches in thickness, 62 feet; quicksand, 138 feet; gravel, 3 feet; gravel and cement, 1 foot; blue clay, increasing in hardness as the depth increased, 58 feet; total depth, 270 feet. Struck redwood at 200 feet. This well is three miles east of the San Joaquin river.

Modesto Water Works Well.

Five miles northeast of the Rodgers well lies Modesto. In the block facing Front street and back of the postoffice is a surface well 190 feet deep, bored last summer, for Messrs. Walthall & Rodgers. Another one 90 feet in depth, bored in 1875, is close to this. Strata of the 190-foot well: Surface soil, 6 feet; quicksand, 6 feet; hard-pan, 20 feet; fine sand, 3 feet; hard-pan, 8 feet; quicksand, streaks of red cement running through it, 127 feet; coarse gravel, 20 feet; stopped in clay. An abundance of good water is pumped by steam power.

Stephen Broadhurst's Well.

Ten miles south of the Temple ranch and two miles inside the Merced county line, a well is being bored on the ranch of Stephen Broadhurst. This well is bored by horse-power; work suspended at present owing to the breaking of the auger-rod, leaving the auger fast in the bottom of the well. Depth reached, 200 feet. Strata as follows: Surface soil, 3 feet; hard sand, 157 feet; blue clay, 3 feet; dark, heavy quicksand, 23 feet; gravel, fine on top, growing coarse toward the bottom, 14 feet; stopped in stiff, hard blue clay. No water yet.

The Evans Well.

One mile south of S. Broadhurst's place is Mrs. C. M. Evans' well, one of the best in the San Joaquin valley. This well was completed about six week ago. Depth of well, 310 feet. Strata as follows: Surface soil, 3 feet; hard-pan, 12 feet; quicksand, with thin strata of clay running through it, 76 feet; quicksand, 122 feet; cobblestone, 20 feet; heavy, coarse gravel, hard blue clay, 50 feet. After penetrating this the first flow was obtained, rising within 3 feet of the surface. Sandstone, 1 foot; quicksand, 22 feet; white clay, under which was obtained the present flow, 4 feet. The hore of this well is 7 inches. After striking the first flow, 6-inch casing was sunk, and below that point somewhere, another flow was obtained, beyond which 5-inch casing was used; the second flow brought the water just above the top. The pipe rises above the surface 2 feet, and water comes up in a steady rapid current 3½ inches above the edge of the pipe. Old miners estimate the stream at 22 inches, miners' measurment. Others estimate a flow of 175 gallons per minute, or 252,000 gallons per day. The area which it will irrigate is variously estimated at from 40 acres to 320 acres. This is purely guess work, as no one has data by which to determine; and the area irrigated by two wells of equal capacity will vary widely according to locality and degree of heat, and consequent evaporation, and according to the different kinds of soil to be irrigated and the kind of vegetation raised upon it. Again, the amount of water required after the second year will be much less than that required the first two years, before the soil becomes thoroughly saturated. The land on Mrs. Evans' ranch is a light sand loam, heavier than the soil east of her, and lighter than that north and close to the San Joaquin river. Her well is 3½ miles north of Hills' Ferry, and one mile east of the river. The total cost of the well was $450. The land is unproductive without irrigation and very productive with it. Had she not obtained water she would have been obliged to abandon her ranch, as dependence on stock ranging over a half-section, and a small garden afforded but a meager support. Everyone rejoices at the fortune which insures comfort to her declining years, and a little competence to her children.

Charles Broadhurst's Well.

This well is a quarter of a mile east of Mrs. Evans' well. It was bored last February, and is 300 feet deep. Strata are as follows: Surface soil, 3 feet; hard-pan, 18 feet; quicksand, with thin layers of cement running through it, cement strata 2 to 4 inches thick, 102 feet; blue clay, 19 feet; quicksand, with thin layers of blue clay running through it and gravel mixed through the last few feet, 39 feet; gravel size of hen's eggs, 1 foot; solid blue clay (first flow), 54 feet; quicksand, 60 feet; light-colored clay, 4 feet. Here a flow of water was struck, flowing about 20 gallons per minute, now increased to 30 gallons per minute. At the depth of 102 feet, a petrified molar tooth was found. It was shown in Merced City, but it was not known to what species it belonged. At the depth of 200 feet, several pieces of wood, supposed to be redwood, were brought to the surface. One piece was about 5 inches long by 3 inches wide.

Mr. Broadhurst's soil is a light sand loam, well adapted to gardening. Chas. Broadhurst was the first one to strike flowing artesian water north of the Merced river.

Wells on the West Side in Stanislaus County.

Two attempts have been made to get artesian water on the west side of the San Joaquin. The first attempt was made on the Smith ranch about 10 miles northwest of Hill's Ferry, on the Big Salada. This well was bored between three or four years ago. We could gain no definite information relative to this well. It was bored about 350 feet, and abandoned. A flow of water was struck coming to within three feet of the surface. A ditch was cut down to the water and led into the creek. The water is unfit for any purpose, save physic, as it is as salt as brine.

Mr. N. E. Bunker sunk a well 300 feet, on the Chapman ranch, out towards the Cottonwoods and close by Lux & Miller's ditch, some years since. He passed through two thick strata of clay and stopped in gravel and cement, getting a flow of water to within 4 feet of the surface.

Points of Similarity.

The wells we have been considering on the east side of the San Joaquin river are scattered over a line of territory 28 miles in length, from Modesto to Hawkins' landing on the Merced river. A short distance above Hawkins' landing we are told that another well has recently been bored on the Stephenson ranch. We did not visit this well. In the six wells, the strata of which we have given, we notice that a stratum of coarse gravel, from three to 20 feet in thickness, is encountered at a common depth ranging from 175 to 213 feet in depth. In the Modesto well a stratum of gravel 20 feet thick is found at the depth of 170 feet; in the Rodgers well at from 189 to 192 feet, three feet thick; in the Temple well, at 208 to 211 feet, three feet thick; in S. Broadhurst's well, at 186 to 200 feet, 14 feet thick; in the Evans well at 213 to 233 feet, 20 in thickness; in C. Broadhurst's well at 175 to 180 feet, five thick mixed with sand. In each instance the gravel is water-worn and evidently marks the depths at which it is found, as the bottom of a large inland stream or lake of some former period. In five of these wells the stratum immediately above the gravel was sand. In the Rodgers well, the Temple well and the Evans well, the strata above the gravel occur in precisely the same order, though varying in thickness, and in each the stratum just above the gravel is sand, ranging in thickness from 175 to 200 feet. In each of the six wells, blue clay lies just below the gravel, and in four wells, where it has been penetrated, it ranges from 50 to 74 feet in thickness. In four of these wells mention is made of wood brought to the surface, supposed to be redwood; in two wells at a depth of 200 feet in blue clay; in a third at 200 feet in quicksand; and in the fourth at 188 feet in gravel. It is an open question whether or not this was driftwood from higher lands, as we believe it to be, or grew on the spot. Something resembling tule was found in the Temple well, and the "leaves" in Mr. Rodgers' well may have been the same.

A line drawn south from Oakdale to a point about five miles east of Turlock would divide the level sand lands on the west from the rougher, more uneven, red lands, adobe and mulatto lands, on the east. We believe all that portion west of such a line down to the San Joaquin might be, to a large extent, irrigated with profit, and that it may be considered an artesian well belt in which an overflow may be obtained, with reasonable certainty, by boring from 300 to 425 feet. All the flowing wells obtained thus far, north of the Merced river, have been bored by those least able to take any risks. There are several large landholders, however, who have not contributed one cent, who will heroically face the new situation and put up the price of their land on the strength of it, with a steady nerve that comes of far-sightedness above ground based on occult demonstrations beneath.

Artesian Wells in Stanislaus County.

There is water here. All that is wanted is some one to go after it and employ men with suitable tools, and men who know how to handle them. The day of ditches, long and expensive, has not yet come. Twenty years hence, when our population is more dense, ditches will be an imperative necessity. To-day artesian water, where it can be obtained, is perhaps preferable, for the ground has to be prepared and the people must grow into the knowledge of the most economical method of applying water for satisfaction or profit.

H. E. HALLETT.

Turlock, Nov. 11th.

The Martin White Case.

[Continued from last week.]

The Plaintiff Appeals.

The plaintiff, appealing from the judgment and from the order denying her motion for a new trial, makes a number of assignments of error, which, however, are all involved in the three propositions following. It is contended:

First—That the Paymaster claim was not located in conformity with the act of Congress and the rules of the district, and consequently that it was void.

Second—That the Paymaster locators, if they ever had a good claim, abandoned it. And,

Third—That they are estopped by their own acts from asserting any claim adverse to the Shark.

Keeping these propositions entirely distinct, and confining our attention for the present to the first, it is to be observed that there is no question that the locators of the Paymaster were the original discoverers of the ledge in controversy; that they made a *bona-fide* attempt to locate it; that their claim was notorious; that they and their successors have continued to occupy and develop the property; that the Shark locators were aware of the priority of the Paymaster claim, and originally repudiated any intention of locating upon the same vein. These facts being conceded, the only position open to the appellant, and the only position her counsel have attempted to maintain, is that a mining claim cannot be held except by compliance with certain requirements of the mining laws; that the Paymaster locators did not conform to those requirements, while the locators of the Shark did, and that, as a necessary consequence, the law gives her the property. Aside from the questions of abandonment and estoppel, she claims nothing except from a strict application of the law, regardless of any seeming hardship in depriving the defendant of a mine which its predecessors were the first to discover, claim and develop. There can be no doubt as to the

Correctness of the Position

Upon which the claim is founded. The United States have granted to their citizens, and to those who have declared their intention to become such, the right to explore and occupy the public mineral lands. (U. S. Revised Statutes, Sec. 2319.) Those qualified locators who comply with the laws of the United States, and the local regulations not in conflict therewith, governing their possessory title, have the exclusive right of possession and enjoyment of their locations. (R. S. 2322.) He who complies with the law has the exclusive right. Therefore, if it is true that the Shark locators complied and those of the Paymaster did not, the plaintiff must take the mine, no matter who is entitled to the credit of the discovery.

What Constitutes Compliance?

The questions involved in this branch of the case have led to a very thorough and elaborate discussion of the mining laws of the United States, and particularly of the act of Congress of May 10th, 1872 (R. S., Sec. 2319, *et seq.*), under which these claims were located, and which embodies the most important features of the mining legislation. The same questions were, to some extent, involved in the case of the Golden Fleece Co. vs. The Cable Con. Co. (12 Nev., 312), but were not very fully argued, and were discussed in the opinion only so far as seemed to be necessary for the disposition of that case. Some of the conclusions then announced have been questioned by counsel for respondent in this, but after a thorough re-examination of the whole subject, with all the light that has been thrown upon it by the most elaborate argument, oral and written, we remain entirely satisfied with that opinion. So far as it goes it is a correct expositiou of our present understanding of the law. But it does not cover the whole ground, and is, perhaps, not sufficiently explicit upon some of the points adverted to. The magnitude of this case and the great importance of the subject to a mining community warrant a restatement of our views in a more complete and, we hope, a more convincing form.

Distinct Marking Necessary.

One of the imperative requirements of the statute—an indispensable condition precedent of a valid location—is that it shall be "distinctly marked on the ground so that its boundaries can be readily traced (R. S., 2324)." By reference to the foregoing statement of facts it will be seen that one of the locators of the Shark in April, 1874, marked the boundaries of that location by setting stakes at the four corners of the claim. It is conceded that this was a sufficient marking of that location; but it is contended that the Paymaster had been sufficiently marked since October 10th, 1872, by means of the two stakes at the ends of the claim on the line of the croppings and by the location monument at the point of discovery. Whether this marking was sufficient to answer the requirements of the statute is the principal question in the case, and, as a step towards its solution, counsel have devoted a great portion of their argument to the preliminary question:

Of What does a Mining Claim Consist?

What are its essentials, what are its incidents? Is it the surface ground that is located or is it the vein with the surface as an incident? It is conceived that a determination of this point will greatly facilitate the inquiry as to what sort of marking of boundaries is required. Counsel for appellent contend that the location is of the surface and that stakes at the corners of the claim are essential. Counsel for respondent insist that the location is of the vein as the principal thing with the surface as a mere incident, and that stakes to define the limits of the claim upon the vein are sufficient.

What we said in the Golden Fleece case we think expresses the truth in regard to this matter: "It is true that the vein is the principal thing and that the surface is but an incident thereto; but it is also true that the mining law has provided no means of locating a vein except by defining a surface claim, including the croppings or point at which the vein is exposed, and the part of the vein located is determined by reference to the lines of the surface claim." (12 Nev. 339.)

Silver Cliff—A Mistake.

A correspondent of the Denver *Tribune* comments upon an article in that paper regarding the new chloride discoveries as follows:

"You say: 'Intelligent prospectors are beginning to be uneasy about the lasting character of the claims they have staked, *especially as depth does not indicate increasing richness.*' The italics are my own. I want to ask why 'intelligent prospectors,' so called, still cling to the absurd and wholly unwarrantable notion that mineral deposits increase in richness with depth? No class of mineral deposits, he they veine or otherwise, show this characteristic. The idea is directly opposed to all experience in this or the Old World. It has no foundation in fact, and no support in reason, and yet the prospectors believe it, against the evidence furnished by their daily labor, and the credulous public accept it in silence without question." Without stopping to ask this correspondent why it is that the mines of Virginia City are worked at immense expense to great depths while rich surface deposits are idle all over the country, we will simply refer him to the articles on Almaden now running in the PRESS.

Bullion for the Year.

Linderman's report for the year ending June 30th, 1878, will show the bullion product for that year to have been as follows:

	Gold.	Silver.
California	$15,260,676	$ 2,373,339
Nevada	19,546,513	28,130,350
Colorado	3,306,404	5,394,040
Montana	2,260,511	1,609,635
Idaho	1,150,000	2,200,000
Utah	382,000	5,208,000
Arizona	500,000	3,000,000
New Mexico	175,000	500,000
Oregon	1,000,000	100,000
Washington	300,000	250
Dakota	3,000,000	.....
Lake Superior	.....	100,000
North Carolina	150,000	.....
Georgia	100,000	.....
Other Sources	25,000	25,000
Total	$47,226,107	$46,726,314

ANTHRACITE coal has been discovered in Washington Territory, southeast of Mt. Ranier, and within three miles of the projected Cascade Mountain road of the Northern Pacific. There are several veins of 8 feet, and one of 23 feet.

THE Los Angeles Oil Company have resumed work at Santa Barbara. The well is down 1,460 feet and is being cleaned out preparatory to putting in a new pump.

THE work of developing the copper mine on Guemes island, in Puget sound, has commenced, and will be diligently prosecuted.

A CONTRACT has been let for running a thousand-foot tunnel in the extension of the Bald Mountain claim, at Forest City.

IT is estimated that the bullion product of the mines of Lake county, Colorado, will aggregate $1,500,000 for the current year.

BULLION district, Piute county, Utah, is creating some excitement.

MECHANICAL PROGRESS.

Simple and Compound Engines.

Jnhn Bourne, an English mechanical engineer, has written a new work nn steam eugines, in which some points of comparison are set up between simple and compound engines. We qnete as follows: It has been found that, instead of the speed of engines being limited to the pace employed in the last century, they may be run much faster, provided that the momentum nf the reciprocating parts is balanced, that the ruhbing area nf the bearings is increased, aud that the other parts aro suitably constructed for the higher speed. The advantages nf tho acceleration are, that the motion is more equahle, and that the engine is hoth lighter and cheaper for the generation of a given power, while, from the onlargement of the rubbing surfaces the wear is no greator than it was before. The compouud engine, as uow made, is much more economical in fuel than the simple engine nf the old-fashioned type; hut it is not so much from the use of the double-cylinder arrangement, as from the simultaneous employment of steam of a high pressure worked expansively, that the repnted economy of the compound system has been derived. Engines of similar size using steam of the same pressure and working with the same measure of expansion will consume the same quantity of fuel in generating any given power, whether the engines are nn the simple or compound principle, and it is, therefore, rather in the large use of expansion than in the adoption of the compound principle that the secret of modern economy consists.

Claim for Precession Over Edison.—Reforring to the alleged discovery of Mr. Edison for using an indehnite nnmher of lamps on one circnit, Mr. J. Berger Spence writes: Having speut a considerahle part nf the year in Paris, and being brought specially into contact with the various appliances for lightiug in my capacity as juror in oue hranch of this subject at the exhibition, I have not failed to be a keen observer of the electric light. Until recently my conclusions were certainly not in favor of its ever superseding gas, from its indivisihility, and, consequently, the impracticability of conveyancc. Intelligence from America tells us that Edison has succeeded in this great achievement; hut I think it right to state that Mr. Richard Werdermann is the first in the field, aud to him is the credit due. The best testimony of this is that some weeks ago he had 10 lights from one circuit, and shortly he will have some hundreds. Having myself seen this new invention in practical operation, I have no hesitation in giving it as my opinion that electricity will now be a success in gcueral lighting."

A French Match-Making Machine.—At the Paris exposition Pernet Jouffroy exhibits a match-making machine, the peculiar feature of which is that the name of the firm is printed on every match. A cylindrical block of wood about a foot in diameter is placed on the machine and caused to revolve before a stationary cutting tool, which pares off a slice of the thickness required for the match, and six small blades having a vertical motion cut up this slice into splints, which then fall into a hasket placed below the cutting tool. The work is fed to the tool by hand, and the printing ou the match is effected before the block reaches the tool.

Swiss Method of Steel Hardening.—An excellent method for hardeuing cast steel, as practiced hy Swiss cutlers, is said to be the following: Four parts of powdered yellow resin and 2 parts of train oil are carefully mixed, and 1 part of heated tallow added. The object to be hardened is dipped into this mixture red-hot, and is allowed to remain in it until it is quite cold. Withont having previously cleaned it, the steel is again put into the fire, and is then cooled in boiled water in the ordinary manner. The edges of tools thus hardened are said to resist excellently.

Pulsating Lubricator.—*Engineering* illustrates a very simple pulsating lubricator, the invention of Dr. Paulson, of Loughborough. It is an oil cap which, by a small passage, communicates with the cylinder, into which the lubricant has to be admitted. In this passage is placed a small ball valve, the lift of which may be adjusted. At each stroke of the engine there is a greater or less variation of pressure on the under side of the valve, and the latter is thus made to beat at each stroke, allowing a small quantity of the lubricant to pass into the cylinder at each stroke. The lubricator acts only when the engine is running.

Driving-Wheels on the Pennsylvania Railroad.—Experiments with the locomotives having the five-and-a-half-foot driving-wheels have proved eminently satisfactory. Two of these engines were placed on the road about the 20th of July. For a time they did not work well, and it was found that the power was not evenly distributed in the driving-wheels. The wheels were too light, so they were removed and a new panel inserted in each wheel. This overcame the difficulties in a measure. Larger injection-pumps were added, and now these engines are the fastest on the road.

Utilization of Solar Heat.

The *Mining Journal* brings farther information nf the sucesses of M. Mouchot, of Paris, in the utilization of solar heat. His experiments had for nbjects, on the nne hand, the cooking of food, and the distillation of alcohols; on the other, the use of solar heat as a motive force. In the matter of cooking it was found that mirrors nf less thau one-fifth square meter sufficed to roast half a kilogramme of beef in 22 minutes, to coupleto stews in au hour and a half that required four hours with an ordinary wood fire, and to raise to hoiling in half an hour three-quarters of a liter of cold water. A puro brandy was obtained in a short time from the distilling apparatus. For nbtaining the motive power M. Mouchot had constructed a large solar receiver, the mirror having an aperture of ahout 20 square meters. In its focus was placed an iron hoiler weighing with accessories 200 kilogrammes, and having a capacity of 100 liters, 70 being devoted to water. This apparatus was put in action on Sept. 2d, for the first time; in half au hour the water was raised to boiliug, and a pressurc of six atmospheres was ultimately registered. On Sept. 29th, a pressure of seven atmospheres was reached in two hours notwithstanding several passing vapors. On different occasions the steam (with a pressure of three atmospheres) was made to drive a Tangye pump, raising 1,500 to 1,800 liters of water per hour a hight of two meters; and to produce ice in a Carre apparatus.

File-Cutting Machine.—In the *Iron Age* reports of the Paris exposition, we read of a file-eutting machiue exhibited hy its inventor, M. Mondon, of Paris. This machine is capable of cutting all kinds and all sizes of files, whether flat, square, round, half-round, three-sided, taper or parallel, from rough to the finest cut. It is composed essentially of a shaft carrying cams, one of which transmits motiou to a lever. This lever moves a system of gearing, which iu its turn transmits motion to a feed screw. This feed screw acts upon the carriages carrying the files. These principal parts, combined with auxillary parts, enable the shaft and the cutting tool to he raised or lowered without altering the relative position of the gearing and the lever. The system of gearing emiployed causes the file to stop in its forward motion during every stroke of the cuttiug tool, and the cams are so arranged on the shaft that the blow of the tools takes place at short intervals, iucluded in the stop produced hy the gearing. The machine exhibited can cut four files at once. It has four hammers, two carrying their chisels and the otber two striking on two chisels mounted differently, hut included in the patents.

Taking Levels for Dressing Floors and Buildings.—A simple and ingenious little apparatus for taking and indicating levels and perpendiculars for buildings and similar purposes has been invented by Mr. John Ryan, of Battersea, England, who purposes to take a hoard of wood of a suitable length (or it may be a length of metal or other suitable material), the edges of which are planed or made perfectly level and true one with the other. In the center a dial is let in or mounted, arranged with divisions to indicate the level or amount of the angle of any horizontal or perpendicular line upon which the edge of the levelling instrument is placed. A pointer is mounted upon an axis in the center of the dial, the opposite end of the pointer being weighted so as to cause it to assume a perpendicular position at all times by its own gravity, and thus indicate upon the dial level perpendicular and angular lines, according to the position in which the instrument is placed.

Novelty in Telegraph Wire.—The *Engineering and Mining Journal* reports that the National Tube Works, at McKeesport, have succeeded in making a novelty in insulated telegraph wire which bids fair to insure the doing away with the unsightly telegraph poles in the streets of our cities. It consists in rolling an iron tuhe around a glass tube which insulates one or more copper wires. The new wire is to be used in underground lines in Philadelphia. It is claimed for it that it is better insulated than the ordinary telegraph wire suspended in air, and that, therefore, less battery power will be needed than with the present system.

Australian World's Fair.—The Department of State has been informed hy the American Vice-Consul-Geueral at Melbourne that it has been decided to hold an international exposition in that city, commencing October, 1880. A puhlic garden in the center of Melhourne has been secured for the exposition, and Parliament has voted $300,000 for the erection of the necessary huildings. This will be the greatest exhihition ever held in the Southern Hemisphere. The Vice-Consul-General suggests that American inventors, for their own protection, should take out pateuts in each of the Australian colonies, each colony having a different patent law.

Malleable Brass.—A German periodical is responsible for the followiug method of making malleable brass: 33 parts of copper and 25 parts of zinc are alloyed, the copper being first put into the crucible, which is loosely covered. As soon as the copper is melted, zinc purified by sulphur is added. The alloy is then cast into molding sand in the shape of bars, which, when still hot, will be found to be malleable and capable of heing brought into any shape without showing cracks.

SCIENTIFIC PROGRESS.

Falls of Dust on Oceans.

These curious phenemena aro commented upon in *Iron*, as follows: About the latitude of the Cape Verde islands, on the Atlautic, it is a frequeut experience of voyagers to observe falls of dry dust and a dry kiud of mist. The material of the dust-mass was examined microscopically many years ago by Ehrenberg, and his opinion was that small particles carried aloft from all countries here formed a transparent dust zone, from which they sometimes sank down, and in whirling movement came to the earth's surface. The material of observation open to Ehrenhorg was somewhat scanty. The phenomenon has therefore heen lately studied auew, and in a more thorough way, hy Herr Hellman, who examined the log-books of 1,096 ships that had passed through the region in question during the years 1854 to 1871. He deals with the case chiefly from a meteorological point of view, aud the following are some of the facts elicited: Most of the dust-falls occur in the zone of the Atlantic between 9 deg. and 16 deg. N. South of 6 deg. N. they are extremely rare, and the furthest south hitherto was in 2 56 N., 26 W. The two furthest west were both in 38 5 W., both about 300 miles from Cape Verde. Dust-falls often occur very simultaneously at very different points of the "Dunkel Meer," or Dark Sea (as Ehrenberg called it). In one case they were 150 miles apart. They also ofteu last for several days, *e. g.*, ten (April, 1859). Surfaces of very different size, up to 100,000 square miles, may receive dust-falls. There is a yearly period in the frequency of the falls. It seems that near the African coast most occur in winter; further west, in the early spring. The direction of the wind during dust-falls was from the east quadrant, and most frequently north-northeast to northeast. The dust-falls observed are very irregularly distributed over the years in question. Of sixty-three, taken at random, there were eight falls of sand and three of sand or dust. Sometimes sand aud dust fall simultaneously. The dust-falls, with great extent east and west, are deuser nearer the African coast. In forty out of sixty-five instances the color of the dust was red. Sometimes there is no coloration. The dry mist of the dark sea is in casual connection with the dust-falls. Herr Hellmann concludes, from the facts, that the dust material comes principally from Africa and the Western Sahara. The possibility of occasional mixturc of particles from South America is not excluded. The distribution of the dust-falls, both in space and in time (they follow the movements of the trade winds), supports the hypothesis, as also does the fact that the falling material is coarser in the east than in the west.

Another Fruitless Cruise for the Pole.—Advices from the eastern coast are to the fact that Captain Tyson's latest Northern venture was fruitless. Captain Tyson says that during his passage north to Disco they had to work their way through 200 miles of ice, and very heavy weather was encountered during the whole passage. At Disco they expected to meet the expedition steamer, but she did not appear, and after waiting in vain many days they at length started on their rcturn passage to Cumberland straits on the 22d of August. Several terrific gales were experienced on this passage, one of which lasted four days, during which time the vessel was hove to, drifting helplessly among immense icebergs, which threatened at every moment to destroy the frail craft. The sufferings of those on board during these four days cannot he adequately described. They almost gave up in despair, and had not the vessel being of the strongest possible build, it probably could not have weathered the gales. They finally arrived at Cumberland straits on the 31st of August, and remained there nearly a fortnight, resting and recuperating after their rough experience. September 12th, they sailed for home, and trouhle hegan again almost immediately, nor seemed to end until they anchored in Provincetown Harbor. They had gales all the way.

A Quartz Thermometer.—Quartz, by its rotatory power, M. Jouhert asserts in the *Comptes Rendus*, constitutes a thermometer of extreme sensihility, fulfilling the essential condition of every thermometer, comparahility. When once the apparatus is fitted up it is merely ueedful in order to find a temperature to read off an angle, and refer to a tahle calculated once for all. It may therefore be hoped that science, aud even industry, may find in this new thermometer an instrument comparable to the mercurial thermometer for the simplicity of its use and the certainty of its sindications. The author's experiments extend from—20° to + 840°, or perhaps 1,500°.

Internal Heat of Rocks.—Daubree reports some experiments upon the heat which may be developed by mechanical action in the interior of rocks, especially in clays, and applies his results to the theory of metamorphism. He finds that the heat increases much more rapidly when the mass is tenacious than when it is plastic, the particles in the latter case heing, as it were, lubricated and slipping over one another. The experiments may, perhaps, also have an important bearing upon Mallet's theory of earthquakes and volcanoes.

Extraction of Iodine and Bromine.

Mr. R. Galloway, F. C. S., has read a paper before the Royal Irish Academy, in which this matter is dealt with at cousiderable length. In the course of it he says: "Many methods have heen proposed for the extraction of the two metalloids, iodine and bromine, from the ash of sea-weed; but the only one, as far as I am aware, which has been followed in the United Kingdom, at least up to a very recent period, is the one ascribed to Wollaston. By this method they are set free from the metals with which they are combined by the addition of sulphuric acid and manganese peroxide tn the mother liquor which remains after the extraction (of course, as far as it is practicable) of potassic sulphate and chloride, and what are termed the kelp salts, which are a mixture of sodic sulphate, carbonate and chloride. The sulphnric acid is added for a twofold purpose; a portion is required for the decompositiou of the alkaline sulphites, sulphites and hyposulphides present in the mother-liquor; the other portion, along with the manganese oxide, liberates the iodine and bromine from their combinations. When the sulphur, which is set free from the decomposition of the hyposulphites, has completely deposited, the clear liquid is drawn off into the iodine still and the manganese peroxide is then added to it. When this process first came into operation, bromine had not been discovered in the ash of sea-weed; even the late Dr. Anderson, in his well-known and often quoted analysis of the ash of sea-weed, does not give it as a constituent. New analytical investigations of the ash of the various sea plants are wanted; the plants ought to be carefully freed, before incineration, from all adheriug salt water, so that the qnantities of chloride, bromine and iodine they naturally contain might he correctly ascertained. The investigation would lead, most probahly, to the discovery that there are, properly speaking, bromine, as well as iodine, producing plants."

Another Electric Lamp.—The announcement of Edison's departure from the old styles of electric lamps has stimulated investigation and invention in that direction. The latest device of which we read is styled the "Sawyer-Man" lamp and is being shown in New York city. The lamp is said to be entirely different from any now in use, as the "electric arc," or the illumination of a current of electricity passing between two carhon points, is not used. In one respect the lamp resembles that proposed by Edison—the incandescence of an indestructible substance, and the subdivision of the current to any extent for use in the lamps. The Sawyer-Man lamp consists of two sets of conductors supporting a diaphragm. On the diaphragm is an upright metal bar, from the top of which extends transversely another metal bar. Immediately under the transverse har is an upright piece of metal called the "anvil," which is also fixed to the diaphragm. Between the transverse piece of metal and the "anvil" is a carbon pencil about one-sixth of an iuch in thickness, which is the light-giving suhstance. This whole apparatus is inclosed in a glass tube closed at the top and fastened to a stand at the bottom. The entire lamp is 7½ inches high and 2½ inches in diameter. The principal value of the apparatus depends upon the fact that when the globe is placed over the lamp the atmospheric air is displaced by nitrogen gas, in which no body heated to an intense degree will undergo oxidization—that is, be burned. The carbon pencil of this lamp, which is readily destroyed hy an electric current in the open air, suffers no change whatever in the nitrogen, although the light caused by the intense heat of the cnrrent suffers no diminntion.

Sulphide of Carbon as a Fire Extinguisher.—At the meeting of the Societe de l'Encouragement of France, Mr. Paliard read a paper on sulpbide of carbon as a fire extinguisher for hurning chimneys. The products of combustion are sulphurous acid gas and carbonic acid gas; there is no necessity to plug the chimney, and the cost of the sulphide is trifling. The firemen of Paris are stated to be expert in its use, and to have nsed it in January last in 32 out of 51 fires, in February in 81 ont of 103 fires, in March in 138 ont of 165 fires, or in 251 out of a total of 319 fires, the extinction being almost instantaneous.

Absorption of Carbonic Oxide by Living Organisms.—N. Grehant has experimented with mixtures of air and minnte portions of carbonic oxide. He finds that a man or an animal, when compelled for a half hour to breathe an atmosphere containing only 1-779 of carhonic oxide, absorbs that gas in sufficient quantities to saturate about half of the red globules of the blood so that they become incapable of absorbing oxygen. In an atmosphere containing 1-1449 of carhonic oxide, about a quarter of the red globules are similarly saturated. Tbese results are interesting and important in relation to physiology and hygiene.

The Phonograph and the Telephone.—In a communication to the *Comptes Rendus* M. Bouilland discusses the question whether the phonograph repeats words on a principle similar to that of the echo. He asserts that, as regards force, tone, speed and quality, the words of phonographic origin differ notably from those which have been uttered, which is not the case with words repeated by an echo. Touching on the telephone, he expresses [doubts as to the part played by the electro-magnctic machine.

Mining Share Market.

The telegrapb bas probably carrisd before now to all wbom this may rcach, news of the tsrrible crasb in tho stock market. Follow down our list of stock quotatious for tbo week, and feel your hreath almost taksn away by the dangerous jumps tbrougb mid-air that the Comstock stocks bave taken during the last few days. But if you would realize tbe full extsnt of ths crash, and gain at ths same time a littls insigbt into tbe absurdity of stock inflation, glance, as the *Bulletin* has dons, at the fluctuations in the valuc of somo of the mines as indicated by tho quotations of ths sbares. "Fivs months ago," says the finaucial editor of ths *Bulletin*, writing on the evoning of the 20th, "ths Sisrra Nevada mine was rated at $400,000 for tbe wholo property, and it is doubtful wbetber it could havs been sold for that figure at that tims bad the whole capital stock heen thrnwu on the market at once. Six weeks ago the mins was rated at $26,000,000. At one moment to-day it was rated at $10,000,000, then at $6,000,000, aud at 3 P. M. at $8,600,000. What it will he when this is rcad it is hard to tell." This morning, November 21st, it was worth from $6,800,000 to $8,000,000. The *Bulletin* goes on to say: "Five montbs ago, Union Consolidated was selling at tbs rate of $500,000. Six montbs ago tbe price had advanced to $19,500,000, showing a gain of $19,000,000 during the interval. Ths stockholders added ths appreciation to tbeir wealth, and counted themsslves fortunate in their investments. To-day the mine was selling all the way from $9,000,000 to $5,500,000, and which of thess values it will bs rated at tbe next call, it is impossible to tell."

This morning it was worth from $5,700,000 to $6,800,000.

He is wisest wbo says notbing about ths causes of these fluctuations. Let it be sufficient tb say that it is probably no fault of tbs mines.

Bullion Shipments.

Since onr last issue, we have noticed the following abipments of bullion:

California.—Bodie, Nov. 14th, $11,641.81.

Nevada.—California, Nov. 16th, $97,140.40; total to date, $178,441.04; Con. Virginia, Nov. 16th, $65,611.78; Independence, Nov. 18th, $12,500; Indian Queen, Nov. 11th, $4,473; Manbattan, Nov. 17tb, $11,700; Navajo, Nov. 18th, $5,300; Northern Belle, Nov. 9th, $4,468.43; 11th, $3,415.32; 13th, $3,874.90; Raymond & Ely, Nov. 12th, $5,340.11.

Utah.—Leeds, $2,981.02; Silver Reef, $2,998.93; $7,918.23.

PACIFIC COAST POSTAL CHANGES.—The following postal cbanges were recorded last week: Postoffices establisbed—New Hope, San Joaquin county, California, Arthur Thornton appointed Postmaster; Kamilahe, Mason county, Washington Territory, John Campbell appointed Postmaster; Summit, Chehalis county, Wasbington Territory, H. D. Taylor, appointed Postmaster. Postoffices discontinued—Home, Baker county, Oregon; New Antrim Prairie, Lewis county, Washington Territory; Shauntie, Beaver county, Utah Territory; Thistle Valley, San Pete county, Utah Territory; Signal, Mohave county, Arizona Territory. Postmastera appointed—J. M. E. Atkinson, Newcastle, King county, Wasbington Territory; Sallie L. Ball, Sitka, Alaska Territory; Joseph Collingwood, Florence, Pinal county, Arizona Territory; William Bracken, Rush Lake, Tooele county, Utah Territory.

THE oyster abucker strikera of Baltimore have at last returned to work at tbe rate of 15 cents for eight quarts.

IT is said that the Russian army in the new Asiatic provinces of Russia, has again been placed on a war footing.

IN tbe Spanish Cortez a proposition that press offenses be made triable by jury and under common law was rejected.

THE river Save has overflowed its banks, involving serious loss of life and immense destruction of military stores.

IT is asserted tbat tbe German government is about to permanently appropriate the funds of the late King of Hanover.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

DRYTOWN.—*Dispatch*, Nov. 16tb: Ths mining and milling machincry pnrchased from tho Coney mine, is intsnded for the Hercules minc, ownsd hy Mr. Humphrsy Recse, of Sutter Creek, and situated on the north bank of Dry creek, about 300 or 400 yards below the Cantennial mine. To all appearances, Mr. Recse intends prosscutiug work vigorously. The croppings are distinctly to he traced directly from Dry creek to ths Phœnix mine, in Plymouth. Tbere is no douht but that this body of quartz is a continuation of tbe Gover. Tho Centennial has now got through sinking at a dspth of 350 fset, and the rock looks as well as usual; hut they must havo soms tims to drift on tho lsdge before one can tell mucb about it. Thsre is no doubt of their having a largs hody of ore. Tbs mill is ready to go to work at almost any time. The Pennsylvania is nearly through sinking, and in another week they will be about ready to run levsls. Ths Potosi is still idls, still tied up in ths law. Gsnerally speaking the quartz interest is looking very much improved.

PLYMOUTH.—*Ledger*, Nov. 16: The Burleigb drill has commenced work upon the ore body at ths Phœnix,'at ths 1100 level. From 160 to 200 hucksts of ore are sent to the surface every 24 hours. The rock being soft, goss through the hatteries very fast. Mr. Hewitt from Amador City, is prospecting a quartz claim, one milc and a half nortb of Plymouth. He is running a tunnel parallel with the ledge. Tbere is a fair sized body of quartz in sight. Ths Empire mill is at a standstill. Grading bas commenced at the Hercules. A quantity of the macbinery and material for the huildings is on the ground. The intention is to put down a new sbaft.

ITEMS.—About 95 tons of rock are now hsing crushed daily at tbe Keystons miue, wbich yields an averags of $9 or $10 per ton. Mr. Fairbanks, Superintendent of the Pennsylvania, has let a contract to sink 100 feet. General prospects of this mine, most cheering. The Gover mine, New Cbicago, looks very well. Purintons' ditcb at Fiddletown, and the American Flat claims at Oleta, are beiug prepared for the rains. Messrs. Mattingly and Bartlstt have purchased Kendall's one-stamp mill, near Volcano, and will operate it on a small quartz vein near Aqusduct.

INYO.

KEARSARGE.—*Independent*, Nov. 9th: The long tunnel Supt. Gray bas been running on the Kearsarge is now fairly into the ledge. The full width of the ledge matter is not yet known; crosscutting still continuing. Soms ore is found, in appearance like tbe croppings 450 feet above, hut no body of it, as yet, of consequence. It appears that the ledge whicb runs north and south nearly, dips some 35 feet in 100 vertically to the west and into the mountain. An extensive body of ore, assaying from $150 to $500 a ton, is exposed in the old shaft, and we feel quite as confident as Mr. Gray it will grow larger if no richer the deeper and further in toward tbe Cliff mine it is followed into the mountain, all of wbich, hy means of this tunnel, will now be an easy task.

BELMONT MINES.—Supt. Peter Taylor will soon atart up hia mill at Lee district, when the miners of Belmont, three miles south of Cerro Gordo, expect to sell their ores at good rates, as all the mines on tbat side carry high grade silver ore. The minea are looking well, and as soon as they bave a market plenty of ore can be extracted. Mr. Taylor is now hauling wood from within two miles of the Belmont mine. This cbange will do away with the expensive method of packing ore on mules to tbe furnace at Cerro Gordo.

THE EMIGRANT.—The Emigrant M. Co., at Lee district, have the water now running to their new mill at the mines. Tbe reduction works are probahly now in operation. The company have a large quantity of ore on the dump already, with plenty more in tbe mines.

PROSPECTING.—A. C. Harvey is engaged prospecting on the south end of what is known as the Buena Vista Hill, Cerro Gordo, with fine prospects ahead. C. R. Jones is in the same locality opening a mine which will aome day amply pay him for his expense and trouble. These mines are situated close to the Beauregard, owned by Porter & Co., and is by good judges claimed to be equal to the famons Union mine.

CERRO GORDO.—The Union Con. have commenced a crosscut at the 700 level, cutting across the slate dyke under the old Santa Maria mine. This ground has long been considered, hy those best qualified to know, as the hest in the hill. Otber drifts, three in numher, are being driven as fast as possible through hard lime rock.

BEVERIDGE DISTRICT. — Messrs. Porter, Hughes, Hunter & Brittan are working about 10 men in Beveridge district, with very satisfactory results. The arastras work very well, and the mines improve as they go down. They will soon make another clean-up.

SILVER SPROUT ORE.—The opinion is given that there is now enough good ore on the dump and in sight in the Silver Sprout mine alone to pay off the present assessment of the company (tbe Rex Montis).

WHITNEY ASSESSMENT WORK.—Supt. Gray has lately been doing some assessment work on ths croppings of a littls ledgs situated some 300 feet below the mouth of the Kearsage tunnel, and called ths Whituey. At first ths ore assayed only about $3 a ton, but as it continuously grew richer and mors plentiful as the work advanced, hs bas continued to drive ahead upon it beyond assessment reqnirements until it now assays $50 a ton right along, and is altogstber a most encouraging prospect. He thinks, howsvsr, it is but an off-shoot or feedsr of the Kearsage or main lode proper.

EL DORADO.

COLOMA.—*Mountain Democrat*, Nov. 16th: Mr. Burgess has been prospecting quartz from Travis creek, about 14 miles above Georgetown, whers he says hs found such ore comparatively unlimited. Ths quartz, after crnshing and careful panning, yielded a prospect of $65 per ton. Mr. Monday, from Union creek, reports some rich gravel prospects and a lively mining rsvival in that vicinity. Fully 100 locations have been made, and ths prospecting thus far done bas yielded most flattering results.

SMITH'S FLAT.—H. L. Robinson's mine, at Smith's Flat, is in fins shape. The 10-stamp mill will soon be ready for work. It is to he run hy a burdy-gurdy wheel, the pressure coming from the E. D. W. & D. G. M. Co.'s ditch above the falls. The Benfisldt mine is prospecting finely. The inclins is down 360 feet, with a fall of about 50 feet.

MARIPOSA.

LEASE OF MARIPOSA LEAD.—*Gazette*, Nov. 16: Mr. John W. Wilcox has leased from tbe Mariposa land and mining company, for the term of five years, with tbe privilege of extending tbe time, that portion of ths grant containing the valuable quartz veins and uines known as tbs Mariposa Lead, and Missouri Gulch mines, together with thc mills, macbinery and appurtenances thereto attached.

MONO.

ITEMS.—Bodie *Standard:* Crosscuts ars being vigorously pushed to the Packard & Morton vein of the Red Cloud Con. One bas reached it. It is 13 feet wide and has perfect walls. Ths whole ledge will mill profitably. The stopes of the Standard look well and yield the usual amount of ore. Rsports from the Bodic are favorable. A daily average of 40 tons of ore is raissd. Tbe mill runs steadily. Pay ore has been struck in tbe University. More encouraging quartz veins in the South Bodis. Everything progresses favorably in the Champion. McClinton ledge is somewhat smaller, hut of good quality and witb prospects of widening. With a shaft 100 feet deep, and a drift 42 feet long, the Republic Con. has cut a ledge 11 feet thick, assaying from $10 to $45 per ton. Present outlook for Queen Bee reported good. "Fine ore" is the word from the Bulwer. The ledge in the bottom of the Noonday shaft continues fins. The South Bulwer will sink 250 feet, make a station and tben crosscut towards the ledge.

WEST PACIFIC.—This mins is situated on High Peak bill, adjoining the Con. Pacific, and in the immediate vicinity of the Bulwer, Belvidere, Standard, Bodie and Summit mines. Tbe West Pacific was discovered and located about a montb since, on croppings. Has a very fine ledge of gold-hearing quartz, samples of which assay from $85 up to very high figures. A timbered shaft has been sunk 30 feet, and in it two otber fine ledges have heen struck, both of wbich prospect well in gold. The sole owners of this piece of mining property are General George R. Vernon and Judge D. V. Goodson, who intend at once to incorporate in San Francisco.

SOUTH BELVIDERE.—Work commenced on shaft. Energetic sinking will be continued throughout the winter.

RIQUEZA.—Progress made last week, 10 feet; total depth of main shaft, 270 feet. Sinking was delayed the past week on acconnt of breaking tbe whim post, wbich is, however, now repaired and in working order. Crosscuts on 210 level is making fair progress in favorable ground, and are being continued.

MAYBELLE.—Shaft down 280 feet; bottom still continues in favorable sinking ground, and evidences go to show the near approach of the same olass of ore as found in the Dudley on the north, and the Red Cloud on the south, as the shaft is heing sunk on tbe line of tbe recent discoveries made in tbese two last-mentioned mines. Lumher is being received for the erection of a new shaft-bouse and blacksmith shop.

SPAULDING.—Since last report, north and eouth drifts from 330 level have been started. The north has advanced 10 feet and the south drift 12 feet. The shaft has reached a total depth of 330 feet. The north drift on 230 level is now in 85 feet, ledge looking well in face. Machinery in good order, and mattere ahout the mine ahove and below ground in first-class order.

GLEN DALE CON.—Looking favorahle. Main working double-compartment shaft down 27 feet. Struck some very fine quartz feeders bearing to the main ledge. The ground is favorable for working and a canvas house is being erected for temporary use, until lumher can be ohtained. It is the intention of the company to build steam hoisting works soon.

WHITE CLOUD.—The east crosscut from the bottom of tbe shaft, 94 feet, is now in 32 feet, and the formation indicates the close proximity of the ledge. A stratum was cut six inches in width, assaying $18. A drift is being run south on the ledge from the Red Cloud to connect with this mine.

CON. PACIFIC.—Work is being pushed as rapidly as possiblo in crosscnt No. 1 from Pacific vein No. 2 to Pacifio No. 1, and it is expected that ths ledgs will be cnt during tbe present week. Work bas been resumed on tbe new working sbaft, wbicb is 275 feet south of the mnnth of ths tunnel. Ths shaft is now down 36 feet, and work is heing pressed with a full force of msn. Ths nsual quantity of rich ors is bsing taksn from the stopes of Pacific No. 2. A road has been made to the ore dump, in preparation for bauling to the mill. Crusbing will bs commenced between ths 20th inst. and Decsmher 1st.

GOODSHAW.—Works all inclosed with a fine huilding, and sverything working nicely. Work hslow in this mins is progressing rapidly, and a large amount of rock heing boisted to tbc surfacs.

TRUE BLUE.—Ths west crosscut bas attained a leugth of 30 feet; progress during the week, 12 feet. Several small feeders have been cut, pitching toward ths ledge. Work progressing favorably.

MISCELLANEOUS MINES.—Feeders of quartz in tbe Syndicate west crosscut. Assays in the hottom of the Sitting Bull sbaft yield over $100 per ton. The west crosscut on the 400 lsvel of ths Blackhawk is in 42 feet; the east, 55, in softer formation mixed with quartz. Engine at nsw shaft is sst. The Dudley looks well. Another 100 feet will he sunk befors crosscutting. Ths ledgs in the Summit soutb drift is tbree and one-half feet wide and looks well. Shaft of the Nevada pushed with energy. The Bodie tunnel is in 580 feet. Ventilation good. Crosscutting contiaues in the Orisnt. Sinking progresses favorably in the Relief Con. Operations in the Ajax will be resumed as soon as possibls. Crosscutting is probably progressing already in the Mono. Soutb Standard shaft is down 330 feet. Work will shortly be recommenced in the Chieftain and continued througb winter. Mono and Cross shaft still sinking. Jesse Bradford will run the Bulletin and True Blue.

NEVADA.

ROUGH AND READY LIVES.—*Transcript:* Prospects look hetter here now than they have for years. New quartz mines are being discovered and old ones developed. Tbe Iron Clad has shut down for repairs. The company is putting up a one-stamp battery of the Kendall patent. They ars down about 95 feet on the ledge, and are running drifts east and west. Ons they are in about 120 feet from the main sbaft. Tbe ledgs is widening and looks well. The company intends in the spring to put up a large mill if it turns out as expected. C. C. Bitner and Wm. Walker are sinking on an sxtension of the Iron Clad with favorable indications.

WASHINGTON MINE.—Grass Valley *Union*, Nov. 17: This mins is situated a half mils or more northeast of the Idaho. Work was first commenced upon it ssveral years ago, but only diligently prosecuted within the last six montbs. The incline bas been sunk to a deptb of 140 feet and a drift nortb of the vein bas now reached a distance of 100 feet, whers the ledge is found full two feet in width, and carrying largely in sulphurets. It does not show in free gold, but the assays go to $36 per ton. The rock is of a bandsome character, and looke as if it would pay well by mill process. No crushings have ever been made of it, but the company are now having 10 or 12 loads taken out, which is to he put through the mill.

SWAMP ANGEL.—*Union*, Nov. 17: Everything is ready for systematic working. Sufficient ground is open to give working breasts for fully 12 months. In the meantime other drifts will be run, and more backs of ground opened for future working. The first clean-up under the new management was made last week, of a six days' run, which yielded $1,100. Weekly clean-ups will he made in the future. The gravel is not of a very rich character, but it pays regularly and washes easily, as it is not cemented. The company have a large body of ground, wbich it will take years to exhaust. The claim paid a large amount of money to ite former owners, who recently sold it to the present company, a Boston party, for $42,000.

ITEMS.—Mr. Jones, who lately honded the Live Yankee mine, has succeeded in organizing a company to operate it. The rock already taken from the vein is rich. The 650 keg hlast lately exploded in tbe Blue Tent diggings proved a perfect snccess. In one Meadow Lake mine, the Excelsior, it is estimated that there are 1,000,000 tons of gold-bearing quartz above a depth of 100 feet from the surface. The Wild Cat company, prospecting at Steep Hollow, have struck good gravel by tunneling 2,200 feet and then sinking 50 feet. A fine-looking tunnel bas been struck on Wilson Ranch. A drain tunnel will be run to the shaft. Mining Agent Sackett is reviving tbat old hullion-producer—the Sneath & Clay, Gold Flat. There is talk of operating again on the Lecompton ledge. It is thought that the tunnel of the Union Gravel M. Co., at the head of Slate creek, will soon strike the gravel channel. A three-foot ledge, rich in sulphurets, was found a few days ago in the independent, extension of the Murchie.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—Gold Hill *News*, Nov. 20: At the mine worked has progressed steadily and without a change of any kind whatever. At thc 2200 level the station has heen completed and two drifts started, one in a northerly and

Continued on page 332.

Mines and Works of Almaden.—No. 10.

[Translated for the Press from "Annales des Mines."]

Second Period.—From the shafts of division in the ore mass, and at three or four meters abovs or below the line of the drifts which are destined for transportation, crosscuts are run until they reach the walls of the lode, and at distances apart of 3.4 meters. They serve for the construction of brick arches, laid in a mortar of lime and sand; these arches abut upon the walls when these offer a sufficient solidity, and when they do not they penetrate them until they find sufficient support; the excavation for the foundation in the wall is called by the name *rafa*, that for the roof by the name *cabexcadro*. These arches, whose cord is placed perpendicularly to the walls to be sustained, have usually a curvature varying with their width; their thickness is about 0.84 meters (a vara of the old Spanish measure). They construct one of these transverse arches above the drift for tramming, to form the roof of it, while the other serves to support the floor by means of longitudinal arches running from one of these arches to the other. These arches, to which have been given the name fundamental arches, have frequently a span of 12 to 14 meters, sometimes even of 18 to 20 meters, on the lower levels of the deposits of San Francisco and of San Nicholas. These veins are, in fact, so near the one to the other, that it has been thought necessary to remove the small sterile mass which separates them at the west, and to unite the northern wall of San Nicholas to the southern wall of the San Francisco by a kind of grand arch.

Upon each of these fundamental arches of 3.4 meters of length, parallel to their generatrix, is constructed a mass of masonry of solid sandstone, taken from the quarries on the surface near the shaft San Teodoro. This mass is raised as fast as the prisms of ore (on either side of the central zone) above the arch are removed. From time to time vaulted openings are left in the masonry which correspond on the same level, in all the works; these openings are connected by small bridges from two intermediate stages. The two sketches (Figs. 5 and 6) show, the first, the aspect of the works during the construction of the mass of masonry; the second, their appearance at the end of this construction. The fundamental arches are not constructed alone to form the roof or the floor of the drifts for tramming; they are also established sometimes when it is judged necessary at intermediate points, sometimes to accelerate the construction of the mass of masonry, and consequently the removal of the ore, at other times to diminish the pressure upon the inferior arch.

The walls of masonry to which we have given the name of works *(obras)*, are continued till they meet the arch of the floor of the upper level. They are then so arranged as to inclose the provisionary arches; it evidently suffices in order that this may be done, in establishing them, to take the precaution to construct them vertically over the points where later the fundamental arches will be established. The works are calculated and classed according to their direction and their position, with reference to the crosscuts coming from San Teodoro shaft which serves for the point of reference for their establishment; one speaks thus: 1st, 2d, 3d, work to the east, or to the west, in each of the three deposits.

Fig. 7 represents one of these veins, cut by its median plane at the end of the second period. The removal of the columns of ore left between those works constitutes the third period of the exploitation of a mass.

Third Period.—While the exploitation of the columns of ore which are removed during the second period is accomplished by beginning below and working upwards in replacing them by a mass of masonry—that of the reserves is on the contrary always exploited by beginning at the top and working downward. The columns being already cut upon three of their faces, and adhering often but feebly to the walls when these are schistose, the price for the reserves is much the least elevated. When the roof is schistose the workmen are protected against the falling of the rock, sometimes by a covering of planks stretched from the neighboring works, sometimes by a layer of masonry raised upon longitudinal arches, thrown from one work to the other.

It has often happened that they have put off the removal of the reserves, either because they considered it a measure of economy, or because they put off a removal thought to be less easy, perhaps, than that of the first series. A polemic, lively, if not sometimes acrid, upon this subject, engaged divers engineers about 1860; it had the effect of showing the inanity of the objections which were made to this method of exploitation, to prove not only that the removal of the reserves was possible, but even that it was very easy, and finally led them to decide to diminish their importance, and only to preserve those which were really important to the security from all interruption in the production. The removal of nearly all the reserves from the sixth to the eighth level, has show that the fears so strongly expressed by M. M. Bernaldez and Rua Figueroa, in their *Memoria sobre las minas de Almaden*, were not founded.

II.—Organization of Labor.

Let us see now under what economical conditions are executed the operations of tramming, stoping and supporting.

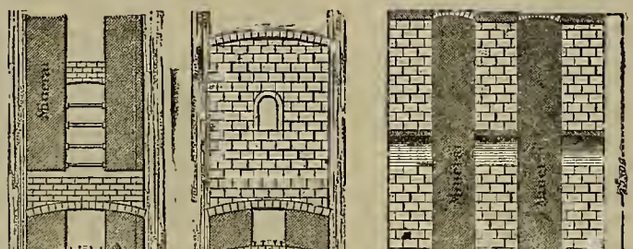
All the miners engaged in interior excavations, whether in the ore or in the barren rock, go by the name of *barreneros*, from the drill called *barreno*, which they principally use. They all work by contract, that is to say, by the taking of a contract at so much for the unit excavated, the unit varying with the nature of the excavation.

These contracts are renewed every month; the regulations oblige the administration of the establishment to observe vigorously all the formalities of a public adjudication. This system in appearance the best of all, certainly does not give at Almaden but poor results; it defends but very badly the interests of the State of which it proposes to be the safeguard. It is already a long time since the miners have taken the plan of associating themselves together and of distributing among themselves the various labores by a sort of lottery. Each group makes then an adjudication of a contract which has expired, without meeting any opposition on the part of the other group, which would deprive them of their good fortune.*

Every labore is then awarded to a group of 20 workmen, who divide themselves into parties of two, three or four men, according to the nature of the excavation it is designed to undertake. These different parties relieve each other in shifts of six hours each; the first shift works from midnight to six in the morning, the second from six to noon, the rest in order. The stopers (in the ore or the rock) work in the three first shifts, the fourth do the tramming of the material as far as the tracks of the principal roadways and the excavations for the timbering.

The price for excavations are usually such that the day of six hours should pay four to five *piecettes* (a *piecette* is about 1.05 francs at current rates, the *piecette* is really of the same weight as the franc. Usage imposes upon each workman that he should drill in these six hours a hole 0.28 meters deep in the ore, and two of these in the schiste or frailesca.

The administration furnishes to the miners tools except hammers, which each man possesses for himself. The tools are deposited in the interior magazines placed upon each level in the neighborhood of the San Teodoro shaft, the expense of lighting and the cost of powder are charged to the account of the workmen.



MASONRY IN ALMADEN MINE.

The number of workmen occupied in the mine at different hours of the day is very variable; one may reckon as a mean for every day as follows:

1st shift	40 to 60 workmen
2d "	300 to 340 "
3d "	180 to 200 "
4th "	180 to 200 "
Total	700 to 800 workmen

The total number of workmen occupied in the interior is, however, much greater, and varies from 2,250 to 2,500.

Every workman then works on the average a shift during three days; but on account of certain work being less dangerous to the health of the men than that of stoping, this work is done every day, or nearly every day, by the same workmen, while those engaged in stoping and in mason work, work in the mine but little more than six hours every five or six days.

The timbering (*entibacion*) is confined to workmen who constitute a special body (the *entibadores*), comprising two classes of workmen. Each of the first class, called *entibadores* of the first class, has under his orders two of the second class. All the timbermen form therefore 40 troops of three workmen; they are charged with all the timbering, renewing of the ladders and supports. One group has for its special duty the constant inspection and repairing of the column of pumps which runs from the seventh level to the surface. Each timberman of the first class gets 2.75 francs per day; each of the second class 2.25 francs; the administration furnishes them with light and tools. They are the best workmen and the most disciplined. The wood used is oak or holly (*chene vert*); it comes from the neighboring forests, and is furnished by contract on an average at 70 to 75 francs per cubic meter.

The masonry work is done by special workmen called *alarifes*; they are paid at so much for the cubic meter of arch, or so much per cubic meter of the solid work. They are placed under the superintendence of master masons, called *maestros de obras*. The administration delivers to them the material; they have to prepare their own mortar, and to raise it as well as the bricks with which they work to the arch or to the construction they are building. They employ in doing this a hand windlass.

The bricks are made at a little distance from the establishment, and are contracted for. They are paid for by the hundred; the cubic meter comes to about 20 francs.

The stone is obtained from the quarries upon the surface, on the hillock south of Almaden in the great banks of white quartzite. Five to six francs per cubic meter is paid for the rock, in place.

The lime comes from the banks of silurian limestone, which are found some 12 or 15 kilometers from Almaden; it is paid for, delivered at the mine, at the rate of 2.25 francs to 2.50 francs per hectoliter. It is of an excellent quality; also the works of masonry have great solidity, a result partly effected no doubt by the waters of the mine, which contain magnesia and lime to the extent of not less than two kilogrammes of deposit per cubic meter.

To be Continued.

* See further on the deplorable riot of 1874, in which perished by assassination MM. Monasterio, Inspector-General of mines, and Buceta, engineer in ordinary.

The British Mineral Yield.

During the year 1877 the mineral product of the United Kingdom was as follows: Coal, 134,610,763 tons, against 133,344,766 in 1876; iron ore, 16,692,802 tons, against 16,841,583 the previous year; lead ore, 80,850 tons, against 79,095 in 1876; tin ore, 14,142 tons, against 13,688 the year before; copper ore, 73,041 tons, against 79,252 in 1876; salt, 2,735,000 tons. The total value of minerals and metals obtained from the mines, etc., of the United Kingdom in 1877 reached £68,281,405—namely, £18,742,960, the value of metals; £47,113,767 coal, and £2,424,679 minerals, earthy, not reduced, together with the value of salt, clays, etc. The produce from these ores may be summed up as follows: 61,403 tons of lead, of the value of £1,262,600; also, 9,500 tons of tin, of the value of £695,182; and 4,486 tons of copper, of the value of £340,067. There were 501,435 oz. of silver obtained, almost all from lead, of the value of £114,877, and 143 oz. of gold, almost all from Merionethshire, of the value of £656. The great item in these returns is the quantity of £6,608,664 tons of pig iron, of the value of £16,191,236; it is estimated that in its manufacture 15,342,445 tons of coal were used.

The *Mining World* comments as follows: It seems matter for regret that so many mines have resigned themselves to the lot of throwing their produce on the market at a loss; but the effort in most cases, we imagine, has been to prevent the complete stoppage of the mines by just paying their working expenses, and, to do this, prices having fallen still further, the output has been augmented. That this policy has only partially been successful, the records of the winding-up court show. As a means to the very salvation of a large number of mines, it is necessary that better prices should be obtained, though when these will be brought about no man dares to prophecy.

The deepest tunnel at Colorado's new mining camp, Carbonate City, is that of Brown & Ghaskell. It is in 75 feet, and yet nothing but a pick and shovel has thus far been used.

It is expected that in about two weeks the new machinery of the Los Angeles Co.'s oil well in Ventura county will be set up to replace the former works, which were burned.

A deposit of antimony sulphate has been found near Greymouth, New Zealand. The analysis gives 84 ounces of gold and 36 ounces of silver to the ton.

Parties are mining gold near Nicasia. A shaft has been sunk 25 feet, and ore assaying $20 per ton has been extracted.

The third shipment on October account, of 22,000 lbs Silver King concentrations, was forwarded Nov. 4th, to San Francisco.

The Tombstone mine, Arizona, is to have a ten-stamp mill.

A four-stamp quartz mill is being set up at Tucson.

The Engineer.

Engineering Notes.

Narrow gauge, says the *Railway Age*, has friends in Scotland, it seems, as it is proposed to build a railway of three feet gauge, 40 miles long, into the Aberdeenshire highlands. The route is through somewhat difficult country and in one part there would be a series of gradients of one in forty. The estimated cost is £4,000 ($20,000) per mile, which is very low for a British railway, and doubtless considerably less than a standard gauge line would cost.

The Grand canal of China, 600 miles long and floating 10,000 flat-bottomed boats employed in the transportation of grain, is likely to be abandoned, as the cost of repairs every year is enormous and the stoppages of navigation are frequent and long continued. The failure of this great highway may help materially to do away the absurd hostility to railways in that country, which certainly cannot long oppose the march of civilization in the form of steam.

An English exchange says: The cylinders for the last pier of the Severn bridge have been founded, and it is hoped that the structure will be ready for opening next spring. The weight of the iron used in the bridge is estimated at about 7,000 tons. The width of the river at the point crossed is 1,186 yards, and the total length of the bridge, including the masonry, viaduct and swing span, will be 1,387 yards.

The rails on the Pembina branch of the Canadian Pacific had reached Niverville, 22 miles south of Winnipeg, November 1st. It is reported that the incoming government purposes constructing the connecting link between Rat Portage and English river, thus completing the road from Thunder bay to Winnipeg, by letting the work in sections, according to the plan introduced and carried out by Mr. Mackenzie. The road west from Red river will be pushed on to the Saskatchewan river as speedily as possible, and thence westward in sections of 100 or 200 miles a year, as the settlement of the country and other circumstances may render desirable. This track is now completed from Ft. William, at Thunder bay, to English river, 113 miles. From there to Rat Portage, or Keewatin, the line has hardly been located, and it is said will not be completed for three or four years. From Rat Portage to Selkirk, 173 miles, the line is nearly finished, as is also the Pembina branch from Selkirk, south to Emerson, 85 miles.

Another Fine Scotch Bridge.

The *Iron Age* says that a great engineering work, which is perhaps scarcely second in importance to the Tay bridge, was commenced last week. Mr. John Waddell, contractor for the foundations of the North British Railway bridge across the Forth, began operations with a large staff of workmen. Starting from abutments on the high ground overlooking the foreshores on either side of the Firth, the bridge is to be carried in the form of a light lattice girder structure upon cylindrical brick columns to the edge of the deep water. As far as this part of the work is concerned, it is not believed to present any feature of difficulty. But in the two great spans, each 1,600 feet long, which are to form the central portion of the structure, there has to be faced one of the most difficult engineering feats imaginable. Regarding this portion of the work the *Scotsman* says that at the point on each side of the estuary where the bottom begins to shelve rapidly downward, there is to be placed an immense composite pier, consisting of four groups of iron columns—sixteen columns in all—firmly bedded on hassments of masonry and securely braced together throughout their entire hight. Over the tops of these piers will he carried immense chains, whose shoreward ends will he anchored to ponderous masses of masonry; and these being continued over two similar piers, placed on the island of Inchgarvie in mid-channel, will afford, on the suspension principle, such assistance as is estimated to be required in supporting the spans, which of course will also rest at either end upon the framework of the piers. The hight of the great 1,600-feet spans has been fixed at 150 feet, to reach which level the shoreward section will require, as in the case of the Tay bridge, to have a certain gradient; and when it is added that the piers will reach the hight of from 500 to 600 feet, some idea may be formed of the imposing appearance which the completed structure will present.

Narrow-Gauge Railway Convention.

The eastern narrow-gauge men held another convention (Cincinnati, Oct. 23d), of which mention is made as follows in the *American Manufacturer:* Eighty-six delegates were in attendance. Col. E. Hurlburt, of Bedford, Indiana, presided and delivered an opening address. The President submitted the report of committe on machinery and rolling stock, with remarks in which he stated that on the first of last January there were nearly 3,100 miles of narrow-gauge railways in operation in the United States, and as many more were now projected. It was claimed in this report that a narrow-gauge engine of the same capacity as a standard engine, could take up the same grade more tons of paying freight, because it had less weight of cars, and that in transportation of

passengers the same rule would prevail. The following questions were submitted for discussion by the Executive Committee: How far narrow-gauge saving in first cost, interest account, dead weight, wear and tear, repairs, etc., affect freight weight; comparison between standard and narrow-gauges as means of development; the general availability of narrow-gauge lines to localities now deprived of any line of railway; to demonstrate that narrow-gauge railways economically constructed and operated are safe investments. The National Central Executive Committee were constituted a Board of Statistics to collect information relative to narrow-gauge construction and operation. The convention adjourned to meet in June next, without a place named, subject to the designation and call of the President.

The Mining Engineer.—At the late meeting of the American Institute of Engineers, an address was delivered by President E. B. Coxe. Mr. Coxe began by calling attention to the fact that the profession of mining engineering was comparatively new in this country. Thirty years ago there were scarcely any educated mining engineers here and few in England, and there was no institution in which a young man could study this profession in the English language. The few we then had worthy the name of mining engineer had mostly studied on the Continent or graduated from the school of practical experience. Their work consisted principally in making surveys and maps of mines and mineral properties, geological surveys and analyses of ores. The inducements were too small to encourage young men to enter the profession, and those who did were commonly regarded merely as baits with which unsophisticated capitalists were to be caught. His opportunities for professional success and usefulness were small, he was compelled to compete with unprincipled adventurers and charlatans, and the profession as a profession had no recognized status. Within a comparatively few years all this has changed; the mining engineers, in the broad sense in which the term is understood by the institute, have become the indispensable allies of capitalists in all undertakings looking to the development of our great and varied national resources, and the profession is now regarded as one of great importance, with a valuable literature peculiarly its own.

Promotion of Transcontinental Lines.—A meeting of friends of the proposed Texas Pacific railway, was held at Chicago last week, at which the following, among other resolutions, was adopted: That we firmly believe that the period has arrived when the general welfare of this country demands that Congress should extend to our communications by water, ocean, gulf, lake and river, the fostering care and generous aid which have been heretofore devoted almost entirely to our communications by land. That we are convinced that such cheap rates of transportation across the continent, from the Mississippi valley to the Pacific coast, as will encourage and develop our trade with China, India, Japan and Australia, will never be secured until the monopoly possessed by the present Pacific railroads shall be broken down by the construction of the Northern Pacific and the Texas Pacific lines, and we recommend that Congress take such action as will lead to the speedy completion of these competing lines on such terms and under such conditions as will secure the Government against pecuniary loss.

Marking Patented Articles.—The Patent law says: All patented articles must be marked with the word "patented," together with the day and year the patent was granted. If the article itself cannot be so marked, a label containing the notice must be affixed to the package containing one or more of the articles. The marking is intended as a notice to the public that the thing is patented, and in any infringement suit by the party failing so to mark, no damages shall be reported by the plaintiff, unless it is proved that the defendant had due notice of the infringement. Any person who falsely marks an article patented that is not patented, or marks anything for which he has not obtained a patent with the name of another who has obtained a patent, or who marks an unpatented article with the word "patent," or any word importing that the thing is patented, for the purpose of deceiving the public, is liable to a penalty of $100 for every such violation of the law, one-half to go the informer.

The Metrical Convention.—The President has officially promulgated, through the State Department, the Convention which has been ratified between the United States and the nations of Europe (except Great Britain) and most of the South American republics, providing for the establishment and maintenance at Paris of an "International Bureau of Weights and Measures." The duties of this bureau will embrace the custody of the international prototypes of the meter and kilogramme, and periodical comparisons of them with the national standards, and with the fundamental standards of the non-metric weights used in the different countries for scientific purposes.

Caustic Soda.—Arnott prepares caustic soda by heating common salt with phosphate of iron—an abundant mineral in some parts—and causing steam to act upon the mixture. The muriatic acid given off is condensed for use or sale. The soda residue is exhausted with water, thus producing a solution of phosphate of soda, which is readily converted into caustic soda by means of lime.

Useful Information.

How to File and Set a Hand-Saw.

The following instructions, although somewhat wearisome, perhaps, to the mechanic, may be of practical use to some of our readers who are removed from saw-sharpening facilities: When a saw is in bad order, the teeth are irregular in length and pitch. This occurs through improper filing, and results in the saw working hard. The reason is that a saw irregularly filed, or set, cuts only with the longest teeth and those that have the most set. To remedy these defects, it should be pointed and filed until the teeth are all of even length, and are pitched so that the front of each tooth is at right angles with the back of the saw. The saw is fastened into a clamp, which consists of a pair of jaws fixed upon a stand, and moved by screws. The ends of the teeth are brought to a level by running a flat file lengthwise of the blade. The best form to give the edge is a slight curve from end to end of the saw, making the middle slightly rounding outward, never hollow.

The handle of the saw when in the clamp should be to the left, and not be changed during the filing. The part held in the clamp should be filed completely before being moved, if the jaws are not long enough to hold the whole. On a rip-saw, the teeth will be filed square on a cross-cut, they are beveled upon alternate sides. Both sides should be filed without moving the saw, which may be done by changing the position and manner of holding the file. A beginner should provide a handle at least a foot long for his files; this will enable him to hold it steadily, which is very necessary for good work. The proper size for a file is three and one-half inches long for a saw having eight teeth to the inch. A saw is set before it is filed. The set given for easy cutting should be such as to make the cut as wide as twice the thickness of the blade.

Several good sets are sold at the tool shops which are self-regulating, and make even work. If only a few of the teeth are short, they need not be pointed, but may be touched with a few strokes at each filing, until the rest are worn down to them. If one has no clamp, a strip of hard wood may be laid upon each side of the saw, and the whole held tightly in a vice. In filing, the strokes should be made from the operator and not towards him. The file should be grasped firmly in the right hand, while the tip is held lightly between the finger and thumb of the other. A safe rule is to work slowly, and to test the teeth as the work progresses with a try square. As long as the faces are kept at right angles with blade of the saw, the backs must come out right.

Recipes for Black Ink.

The following recipes from an exchange may be of use to some of our readers. The following is for jet-black steel-pen ink: "Bruised galls, 1 lb.; logwood, ½ lb.; cloves, ½ oz.; pomegranate rind, ½ lb.; water, 8 lbs. Boil gently for three hours, stirring now and then; strain off the decoction, and add 2 lbs. more water to the ingredients. Simmer gently for an hour, and strain. Mix the strained liquids, which together should weigh 8 lbs. Allow the dregs to subside, and pour off clear. Dissolve in a portion of it common gum, ½ lb., sugar candy, 1 oz.; and in another portion sulphate of iron, ½ lb. Strain both solutions, and mix the whole together. Then add calcined borax, 1 drm.; creosote, 12 drops; dissolved in ½ oz. of spirit of wine."

For blue-black ink the following is commended by good authority: Alleppo galls, bruised, 9 oz.; bruised cloves, 2 drms.; cold water, 80 oz.; sulphate of iron, 3 oz.; sulphuric acid, 70 minims; indigo paste, 4 drms. Place the galls with the cloves in a gallon bottle, pour upon them the water, and digest, shaking often, for a fortnight. Press and filter again through paper into another gallon bottle. Next put in the sulphate of iron, dissolve it, add the acid, and shake briskly. Lastly, add the indigo, mix well, and filter again through paper. The ink is to be kept in well-corked bottles. The writing is at first pale green, but it soon turns to a deep jet black. It is not a copying ink, but may be rendered such by the addition of sugar or glycerine.

Repairing Loose Watch Covers.—Some of our watchmaking readers may get a hint of value in the following which we quote from *Art-Industry*, a neat journal which has arisen from the ashes of the *Silversmith and Watchmaker:* If the rims of hunting-cases become so worn by the friction of the springs that they will not close tightly, or not stay closed at all, the trouble can often be remedied by undercutting the rim at such an angle that the spring will draw the case tight. It is difficult to do this neatly with a graver or other hand tool, and the ordinary steel ratchet-wheel, taken from the material box and mounted on the lathe as a cutting-burr, will be found more to the purpose. A wheel should be selected with very fine teeth; and, if not hard, it should be hardened the same as any other cutting-tool, and mounted on the live spindle in the most convenient manner. This burr will cut and finish a square hole in a main-spring so narrow as to be difficult to punch, besides saving the risk of breaking small files in finishing the hole; the spring to be cut should be bent backwards, so that the hole will not be cut too long. It will also cut a solder from the grooves in spectacles after mending, and do a hundred other little things that no file will do.

Uses of the Lesser Metals.—Cadmium, occasionally employed for the production of very fusible alloys, is usually obtained along with zinc. Tungsten has been recently proposed by Dr. Versmann as a substitute for nickel in German silver, a highly sonorous alloy being obtained by reducing simultaneously tungstic and copper oxides, and fusing the resulting alloy with zinc or brass. The same metal has been suggested as a hardening and ameliorating ingredient in steel, as have also chromium and titanium. Few, indeed, of the remaining metals of this class are of any large industrial importance even in the state of compounds, potassium, sodium and calcium being the main exceptions. Certain of the compounds of barium, strontium, chromium and cobalt are also of considerable importance for a few special purposes and manufactures. Vanadium compounds have been recently introduced for developing certain colors in calico printing, etc., and cerium salts have been used medicinally, while molybdic oxide is a valuable analytical re-agent.

Button Making.—Porcelain buttons, sometimes called agate buttons, are readily made, on the principle of forming mosaic tesseræ, by a machine invented for that purpose, and in 1737 the first button was made by it. The buttons are made by what is known as the "dry process," *i. e.*, by a pressure sufficiently great to compress the dry porcelain powder into a hard and enduring shape. They are made by women, who often turn out twenty-five buttons in a minute, but the usual rate is from twelve to eighteen a minute the year round. The price paid is one cent per gross, at which rate one woman earns from $3 to $4.50 per week.

Indelible Ink for Marking Linen.—Add caustic alkali to a saturated aqueous solution of cuprous chloride until no further precipitate forms; allow the precipitate to settle, draw off the supernatent liquid with a siphon, and dissolve the hydrated copper oxide in the smallest possible quantity of ammonia. It may be mixed with about six per cent. of dextrine for use. Before washing pass a hot iron over the writing.

Food Adulteration in England.—According to official reports during the last year in London, there were 4,177 samples of food and 110 samples of drugs submitted for analysis. Of the former there were 515, or about one-eighth of the whole number examined, pronounced adulterated; but of the 110 samples of the latter examined, only seven were found to be either more or less adulterated.

Good Health.

To Get the Most Out of Life.

Rev. O. B. Frothingham has an article on this subject in the *Herald of Health*, from which we quote paragraphs of excellent counsel:

Length of days is still one of the criteria of a good life, for it implies temperance, frugality, continence, regard for the conditions of prosperity. Is one desirous of obtaining this blessing? Then must he practice moderation in pleasure, cultivate the virtues of prudence and obedience, cherish simplicity, abstain from enervating vices, avoid unseemly violence, repress anarchical and tempestuous dispositions. He must study peace and good will, and thus substitute economy of force for waste, encouraging the powers that build up. Reason reinforces, passion squanders, vice destroys. To escape wear and tear is wisdom; but to escape wear and tear lays a duty on conscience and soul which the foolish cannot understand. Longevity implies material ease and comfort, admitting reasonable contentment, easy social relations, circumstances that do not rasp or fret, and to create these it is necessary that impulse should be submitted to judgment, and that reflection should be strong enough to subordinate desire.

The next condition on which the most is to be extracted from the world is that our days on earth be not only long, but happy. Freedom from misery, from sickness, perplexity, heartache and corroding care, is a condition of successful life. A miserable life cannot by any stretch of interpretation be called well used life, for misery means waste, dissatisfaction, discord. How does one make himself happy? Not by putting himself out of tune with himself and his circumstances, not by running the risk of misfortune, jeopardizing his chances of felicity. The hero may do this; the philanthropist may do it; the reformer; but these do not seek happiness. They are exceptions to the rule. We must not pitch our doctrine on the heroic key. We may be simple, lowly, wise, and say frankly the aim is to make life happy. Hence it has become a trite saying, that the people who wish to make the most of life, must practice the old childlike virtues of sincerity, veracity, consideration, kindness. They must not think of themselves first, but must be willing to believe that they can learn as well as teach, that the right to be served must be balanced by the zeal to serve.

Yet a third condition for getting the utmost out of life is, that life shall be harmless. I do not contend that it should be noble, great, magnanimous, or even conspicuously useful. But how *not to harm* the world; that is a simple thing. Do not cheat; do not lie; do not betray; do not undermine the physical or moral health; do not make light of social advantages; do not fly in the face of immutable facts; do not impugn the established principles of rectitude; do not make war on insitutions that will yield to the power of reason; throw no stumbling block in the way of your neighbor, but open paths as far as you can; multiply opportunities; increase privileges; make it worth while for people with whom you associate to say and think pleasant things of you. Thus, at least, you do no harm—if you do not directly diminish the bulk of evil, you sustain the mass of good; you are conservative of the best; you belong to the salt of the earth; you are a pillar of strength. The least that can be required of any rational being is that he shall live a harmless, an innocent life, as far as he can.

Weaning the Baby.

Dr. Brochard in a French medical journal lays down four rules to be observed in weaning infants, as follows: (1.) It should never be done suddenly, one regimen being gradually transformed into another, so that the child may be progressively prepared for weaning. The time for it, as Trousseau justly observes, cannot be fixed by the almanac, but it must depend upon dentition. As soon as the teeth appear we should commence our preparations. About the fourth or fifth month we may accustom it to the sucking-bottle, substituting this for one of the sucklings at night, and afterwards for another; and even for a fortnight after weaning the child should have nothing but milk. At a later period farinaceous food and broths may be added. Many women begin to give their infants this kind of food far too soon, and at the time of weaning cannot get them to take the milk which should then form almost their only diet. Solid food should be delayed for some weeks, and given only as the teeth appear. (2.) The child should never be weaned until it has teeth. (3.) It should never be weaned during very hot weather when diarrhœa is apt to occur. (4.) It should not be weaned while in the act of cutting its teeth, the intervals which occur between the cutting of the different groups of teeth being selected.

Preparation of Eucalyptus.

We have given before a number of preparations of the medicinal principles in the eucalyptus. As the material is so abundant in this State, its use must be an object of interest. The *Journal of Chemistry* translates from a French source the following formulæ:

Tincture of Eucalyptus.—Take of dried leaves of eucalyptus (cut up) 1 part; alcohol, at 80°, 5 parts; allow to macerate for ten days, then filter.

Wine of Eucalyptus.—Take of dried leaves of eucalyptus, 30 parts; alcohol at 60°, 60 parts; good white wine, 1,000 parts; allow to macerate in the alcohol for 24 hours, then add the wine; after ten days, filter.

Hydro-Alcoholic Extract of Eucalyptus.—Take of dried eucalyptus leaves (cut up) 1,000 parts; water, 3,000 parts; distil to obtain the essential oil; make an aqueous extract of the material remaining in the apparatus, and to it add alcohol at 60°, 1,000 parts. Filter the alcoholic solution and evaporate it to the consistency of an extract; when nearly cold, mix the volatile oil thoroughly with it.

Lime Juice for Rheumatism.—In the *Canada Lancet*, Dr. A. H. Chandler calls attention anew to the use of an old remedy, and reports several severe cases in which good results followed its use. Without regard to the condition of the bowels—unless previously much constipated—he begins with at least ten ounces of lime juice, increasing rapidly to eighteen or twenty-four per diem—from half an ounce to one ounce or more every hour, with not less than double or treble the quantity of cold water, usually diluted and sweetened to the patient's taste. He finds that even on the second day the amendment is decided, and the disease, in acute cases, more particularly sthenic or asthenic, generally subsides on the fourth or fifth day of treatment. He usually prescribes one grain of opium, with or without lead and tannin, night and morning, in order to restrain the bowels which the juice has a tendency to relax. The effects of this treatment are, he says, rapid diminution of joint swelling, diminished perspiration, steady fall of pulse, which often becomes quite slow, with a slight tendency to syncope, the majority of cases requiring quinine and supporting food about the sixth day. Such vigorous treatment should evidently be undertaken only under the supervision of a competent physician.

The Chinese Government Denouncing Opium.—An important and very stringent edict regarding the cultivation of the poppy appears in the Pekin *Gazette* of March 9th last. It is worthy of note that the largest number of victims and the earliest victims to the famine have been the opium smokers. The edict now issued speaks of the people as foolish, coveting wealth, and forgetful of the injury that is being done by the cultivation of the poppy instead of cereals, and it enacts that for the future the cultivation of the noxious drug must cease; disobedience thereto to be visited with severe punishment. This edict applies to the whole of China. The district magistrate of Tientsin has personally visited the opium-smoking resorts, and closed them all. Soldiers and officials are strictly prohibited from smoking, under heavy penalties.

The Week.

No doubt the distracted mind of some poor bankrupt of this week has seen in the dark reports of war in Asia, of financial fears in England, of volcanic outhursts and earthqnakes on our own side of the Atlantic, emhlems too suggestive of the ruin that has fallen upon numherless victims. For the last day or so the popular imagination has heen inflamed. Men seeing their fortunes melting, have hurried to snatch at any rumor which could give them hope of revenge upon that invisihle oppressor who, they believe, had caused all their woe. Riots in Virginia City, the mine buildings on fire, bonanza kiugs bang'ng to the beams in the mills—these are pictures, which, absurd as they are this week, have heen gloated over in the minds of many men. Some will he taught wholesome lessons hy this fearful crash. Yet the stock of gulls is not exhausted, and in less than a year, nay, perhaps within a month, inflation will again be preparing for a feast of the barpies. Few realize the full extent of the evils of stock gamhling. A crisis like the present involves a whole community. The innocent suffer with the guilty. The fever pervades all classes. Bank accounts are overdrawn hy men supposed to be "good," "men who never speculate, who are slow but sure." They have been trusted often; they are trusted now. But suddenly a note comes due and is not paid. The hanker is surprised. His surprise yields place to distrust of all human nature when he finds that the why and wherefore of that numet note is "stocks." This is hut one example among millious even, of the hidden, insidious demoralization that creeps ahout society in the shape of paper certificates signed hy the Presideut and Secretary of a mining company.

THE National Yellow Fever Commission recommend a system of national quarantine, under the direction of the United States Government.

Defects of the Mining Law.

If editors and correspondents are voicing truely the opinions existing in the commnnities which they represent, there is growing dissatisfaction among miners regarding the present mining law. Some regard it as incomplete. A writer to the PRESS a short time ago suggested that if the owner of an unpatented claim has in ons year spent, say ten times as much in working the claim as the law requires he shall do in order to hold it, the law should provide that this amount be credited to him so that he need do no work for the next nine years. Others consider some of the workiugs of the law as too slow and costly. The Land Office, in its granting of mining patents, has becn designated as specially deserving of the name of Circumlocution Office. The cost of ohtainiug a mining patent compared with that for securing a title to agricultural land has heen objected to. A correspondent of the *Mining Record* lately figured up the cost at $1,250 odd. A farmer may obtain a homestead title to 160 acres by an expenditure not necessarily exceeding $100. The present law has heen considered unjust. The writer to the PRESS, ahove referred to, dwells upon the injustice and nselessness of refusing a patent to an alien who holds his claim hy right of lawful purchase from a legitimate locator. The presnt law is held to he, in some particulars, wanting in clearness. An M. E., writing to the *Mining and Engineering Journal*, says: "The law of 1872 gave definite surface lines, hut was chaotic and crude as to the right to the vein, so that it is a question of implication whether a vein may he followed along its strike to the full length of the claim, if it so far departs from its course as to cross the side lines of the claim." Among some minere there is said to he a seemingly ridiculous idea that the preseut law regarding the expenditure of $100 per year on an uupatented claim, requires that the lahor representing that expenditure he performed at the very beginning of the year; this latter heing construed so nicely as to mean 12 M. on New Year's eve. That would be a defect indeed—one which should be immediately remedied. All of this fault-fiuding looks for remedies which would teud to the improvements of the present law. But some have even glanced hackward and longed for the reinstatement of the old law of 1866, if not of the still older order of things when each company of miners made its own district regulations.

When we reflect that the first United States law relating to mineral lands was passed so recently as 1866, it appears that if the present law should have proved faultless it would have presented a pheuomenon unprecedented in the annals of legislative enactment. The history of mining law shows the same evolution that is discernible in the records of law relating to all subjects. First the miners made their own laws. These were thoroughly practical, as might be expected of all productions of that fearless, go-ahead class called pioneers aud prospectors. It has heen said hy a Congressman that the laws of the different mining districts, codified, might themselves have formed a good general law. In fact, the hill of 1866, while introducing the new feature of the United States granting mineral lands to her citizens, consisted in great part of a digest of those same mining district laws. Evolution marched on. Soon the law was found incomplete. The bill of 1866 referred to leads and veins. Meanwhile, placer mining had sprung into a great industry. The law had to be altered in 1870 to suit this increase in the mining field. The importance of having definite United States laws on mining was heginning to be noticeable. The increased security given to mining titles invited more and more to embark in the industry.

Evolution took another step forward. In 1872 a new hill was introduced in Congress. As Sargent said, when explaiuing the new move, "it was nothing new, it was only oiling the machinery of the old." It showed undoubted advancement compared with the previous laws. It reached in the direction of economy. The time for advertising before patenting a claim was redneed some 30 days. Disputes might he settled nearer the claim thau theretofore, thus saving mileage.

That was in 1872. The Senate Committee on Mines and Mining that year was a rather qneer one, considering the States from which the members came. There were Mississippi, Texas, Nehraska, Arkansas and Michigan represented. Altogether there were only seven, we believe. The gentleman who finally presented the hill to the Senate was the member from Mississippi. He called attention to the fact that he was from the only State in the Union which hoasted no share in the mining industry. He thought that his appointment to the duty of presenting the hill might have been a hint that it was about time that he should learn something about these things. The hill passed.

That was six years ago. During those six years the advancement in the mining industry has been almost incredihle. Different ores are worked, different formations have been encountered, the country is growing in population; and the wonder is, not that fault is to be found with the law of 1872, hut that the law of 1872 was not slashed up and amended four years ago, and again two yeare ago.

The miners themselves are the only ones who can discover defects. When thsy do so, they should make known their discoveries. Write to some neighboring publication. Let the defect go the rounds of the country. That is the shortest way to lead to their collection into tangible form. It is cheaper to do this than to leave it to expensive law-suits to call attention to the wants of the miner.

A Section of Geology and Mining.

On Monday evening, a regular meeting of the California Academy of Sciences was held, Vice-President Dr. H. W. Harkness, in the chair.

A specimen of the rock cod was presented by Mr. Harford, of the California Market. Several sections of trees from the Sierra Nevada, intended to illustrate the destroying agency or fungi, were presented hy Mr. Harkness, aud referred to hy him in his lecture on the subject.

Among the donations to the library was the first number of the first volume of the *American Quarterly Microscopical Journal*, edited hy Romyn Hitchcock, of New York, containing the transactions of the New York Microscopical Society. Also, the second number of the sixth volume of the Annals of the Scientific Society at Buenos Ayres—the first exchange from that Society.

It was announced that B. B. Redding had been elected to fill the vacancy in the Board of Trustees, occasioned by the death of D. D. Colton.

Alouzo Phelps and Ed. Parker were elected members of the Society.

W. N. Lockington read a paper on the fish to he found for sale in the markets of the city, giving particular attention to the rock cod, describing the numerous species and quality. Reference was also made to the king fish, now very rarely taken in the waters of the hay, and to the Jew and camel fish, found but seldom north of Point Concepcion.

Dr. H. W. Harkness read a paper on the "Fungi disease in the trees of the Sierra Nevada."

This paper will be published in full in the PRESS.

A Section of Geology, Mineralogy and Mining has heen formed in the Academy, and its organization was announced hy Prof. Le Conte.

Prof. Joseph Le Conte's Remarks.

I have heen requested to announce that, in accordance with au ordinance of the Constitution creating special Sections of the General Academy of Sciences, a few of us on Saturday a week ago organized into a Section of "*Geology, Mineralogy and Mining.*" We make this public announcement, because we do not wish any one to suppose that this thing is done in a corner, or that we wish to be in any sense exclusive. We wish, in fact, to attract ahout us, as a nucleus, all the really good scientific material in this department in the country.

The principle of creating such sections is ohvious and well known to you all. Many subjects are so special in their nature that they cannot be interesting to all scientific men alike, and they cannot be interesting in a general session of the Academy. And yet these very points are frequently the most important, and the most interesting to specialists. Of course, a special Section is the place for such. If there should come up in the Section any topic of general interest, of course it will be brought hefore the Academy as well as before the Section.

In the second place, the closer and more familiar association of kindred spirits in the Section, with the certainty of sympathetic interest even in the nicest special points, kindles a scientific enthusiasm, and stimulates the scientific activity of all. We are all dependent upon the sympathy of other persons for our scientific activity. For this reason, therefore, in all like societies it is necessary to have such Sections.

Now we hope, also, that the scientific activity which is thus etimulated within the various Sections, of which we have already two, will react in various directions npon the Academy at large, and inject new life and vigor in the whole body.

I said we wished to attract ahout us, as a nucleus, all the really good material in that special departmeut in the Academy. By this I mean not only pure scientists, hut also practical scientists. I am perfectly sure that the association of pure and practical science will he of the very highest benefit to hoth; for evidently the pure or ahstract ecientist finds on the other eide the materials upon which he works, and of course the presence and association with practical ecientific men gives purpose and hody and energy to his work. On the other hand there cannot he the slighest doubt that the association with pure or ahstract scientists will imhue practical men with the liheral spirit of pure science. Only lst them be endowed with the true epirit of science.

There is a common deeply-rooted prejudice in the popular mind, and it seems to be affecting even scientific men, on the one side, as well as practical men on the other, that there is a kind of antagonism hetween theory and practice.

Now so far from this heing the case, a true theory is indissoluhly connected with a true practice. There is an indissoluhle marriage hond hetween them. It is even closer than this: it has the relation of spirit and hody. Science is a complex web, woven warp and woof; the *warp* is ecientific theory, the *woof* is the material derived from nature. It is impossihle that one should exist apart from the other. Every intelligent human action, particularly of the complex kind, is uecessarily guided hy theory. And this is the true difference, in fact, hetween human activity and ordinary animal action. Hnman action is the most complex, and it is always guided hy theory. Ths only difference hetween good practice and bad practice is that one is guided hy good theory, and the other is guided hy false or bad theory. But all human action which pretends to hs intelligent or rational, is guided hy some theory, good or bad.

There is, I admit, a kind of theorizing, a spirit of theorizing, and a theoretical hahit of mind, which is destructive of good practical work. But it is equally destructive of true science also. I refer to that theorizing upon an nnsubstantial hasis, that theorizing merely for the sake of theorizing, and merely for the pleasure of the intellectual activity of theorizing—merely for the self-complacent contemplation of the heauty of the theories that we create out of our minds. In this case the whole web, woof and warp, is woven out of the human mind, without the material being furnished to it hy nature. It is like castle building in the air, nnsubstantial and resting upon a cloud; heautiful it may he to contemplate, hut rapidly disappearing hefore the sun. It is like spider's wehs, woven out of its own howels, hoth warp and woof; beautiful and intricats in its structure, and glittering with the dew in the early morning, hut quickly hrushed away from the path of progress. But as I have said, this kind of theorizing is equally as fatal to true science as it is to practical work.

This kind of theorizing is what we would call speculation. Now, speculation bears the same relation to true theorizing in the world of science, which speculatiou hears to legitimate enterprise in business. As speculation in the field of business is prostrating to true enterprise, and through it prostrating to the true prosperity of the community, even so speculation in the realm of science is destructive to true theorizing, and therefore destructive to real practical work.

But as enterprise is the basis upon which all legitimate industry rests, and must inevitahly rest, and the whole prosperity of society must also rest with it, even so it is upon sound cautious inductive theorizing that the whole progress of science and also of sound practical work is hased. Science is the open foe of speculation in hoth fields. Science is the fast friend of legitimate enterprise and legitimate industry, also in hoth fields.

I repeat then that we announce thie fact of the organization of the Geological Section, hoping to attract ahout us as a nucleus, and hy a process of rational scientific selection, all the good scientific material in that department in the Academy, and we hope for the hest results, not only to the Geological Section, but also for the Academy of Sciences, and finally for the oommunity itself.

The conclusion of Prof. Le Conte's remarks were greeted with hearty applause.

J. S. Phillips' Theory for Mountain Formations.

In the 1871 and 1873 editions of the "Explorers', Miners', and Metallurgists' Companion," Mr. Phillips favors a gradual cooling of the earth, and reasons thus:

1. The surface is colder than the interior.

2. The hotter interior is cooling and contracting faster than the surface shell.

3. Gravitation aids contraction.

4. The solid surface crust cannot follow the faster contracting interior without lessening the length of its circumferential lines, or area, hy lateral crushing and thickening, at places.

5. The valleys, plains, and ocean beds have thus settled or sunk faster than the mountainous parts, which hy loitering only appear to he thus elevated. Volcanic action is excepted.

6. This astonnding side pressure has produced sufficient heat for local plasticity and metamorphism of the rocks, and for aiding and sustaining volcanic action.

7. Unequal speed of shrinkage of spherical sections in contact must, under great compressions, produce violent jarring with much friction and local heat, which sometimes accounts for earthqnakes hy the lateral ruhhing of the interior heneath the outer shell when crushing and thickeuing subterranean mountains, etc.

8. The settling of the outlying plaine by gravitation and earthquakes has heen the chief cause for the fracture of veine.

In his third edition, which is now passing through the press, he has added several other ideas on this subject which will ehortly appear.

A great similarity of ideas will be observed hy comparing the above with those of Prof. Le Conte, given in our last week's issue, as taken from his recent work on geology, published in 1878.

SECRETARY SCHURZ will call for an explanation from General Sheridan in regard to his charges against the management of the Indian Bureau.

THE Commercial Convention meets at New Orleans Decemher 3d, for which complete preparations have heen made.

RAILROAD collision in South Wales. Killed, 12; injured, 50.

Artesian Wells.—No. 7.

Drilling Tools

Fig. 2 represents a wedge-bit. This bit weighs 100 pounds, and contains 40 pounds of English cast-steel. When it is used, a reamer (Fig. 3) must be employed to keep the hole round and straight. A Z-bit serves the purpose of both drill and reamer. Fig. 4 shows a sand-pump.

Fig. 5 represents at work an improved well-drilling and prospecting machine. The derrick ordinarily used is supplanted by a mast and frame, as shown. The drill is attached to a rope. A 1¼-inch hawser-laid rope is used in boring to a depth of about 200 feet. Wire cable, ⅝-inch or ¾-inch, may be used for greater depths. The sand-pump requires only ½-inch rope. The rope passes up from the hole over a pulley at the top of the mast, reaches down to and passes under the sheave on the inclined lever, shown as a diagonal of frame. From the sheave, the rope passes under a roller at the foot of the mast, and then up over the large drum or rope-spool. The revolution of this spool controls the lowering and raising of the drill. When the latter is to be lowered, the operator jerks the rope, which, in the figure, is shown as held in the right hand. The jerk pulls away the pall from the ratchet-wheel, and allows the latter to revolve as many notches as the operator wishes. This wheel in turn controls the spool, which unwinds the rope when the ratchet is free. The churning motion of the drill is given by the raising and lowering of the inclined lever. The lever acts exactly as a big treadle, on a grindstone for instance, the revolving arm taking the place of the foot of the grinder. To draw the drill up, remove the rope-clamp the left hand is shown as holding, move a slide on the left side of the machine (not shown in the cut) with the foot, and the lever latch will hold the lever down. Then, with the left hand, placed on the small lever (just below the elbow of the left arm); throw the clutch in gear, thus connecting the rope-spool by cog-wheels with the axle on which the revolving arm on the right turns. This axle, continuing to turn the spool or drum, winds up the rope. The sand-pump rope is shown at the small pulley, half way up the mast. It passes down and is wound upon a reel, shown near the center of the frame. This reel is revolved by a friction belt, which is controlled by the treadle lever, shown near the left foot of the operator.

The power to run the whole machine is furnished by one or two horses. The horse-power is connected with the machine by means of a tumbling-rod, as shown. It is said that two horses and one man are all that are needed to do all the work; and the operator need not leave his seat, except to empty the sand-pump, and to unscrew or to remove the drill-bit, etc. These changes can be made without stopping the horses.

The portability of the machine is greatly added to by the hinge, shown about five feet up the mast, which allows of the latter's being folded down upon the frame.

Directions for Starting the Drill.

The following directions for using this machine contain much practical information applicable to boring with any apparatus. Start the drill slowly and carefully. A man or boy must stand at the drill to turn it around a little each time it is raised, so the drill will not strike twice in the same position. Before starting, be sure that the bit and rods are tightly screwed together by means of a wooden lever inserted between the handles of the wrenches. This is a very important point and should not be neglected. Drill with a tight rope; do not let out too fast, but drill on what is called "the spring of the rope;" otherwise, the hole will not be straight. Keep three feet of water in the hole, all the time, while drilling. In many cases it is not necessary to pour water in the hole after sinking 20 or 30 feet, as some water is often found at that depth. As soon as the drill has worked down 20 or 24 inches, let the lever latch slip, which will stop and hold the main lever down, which stops the churning motion of the drill; then throw the clutch in gear and draw the drill out; then put in the sand-pump and churn it up and down by hand four or six inches about 25 times, when it will be filled with the chippings of rocks, bear down on the friction belt lever and raise the sand-pump out, empty it (see, each time, that the leather valve at bottom of sand-pump is clear of all small pieces of rock or mud), repeat this operation five or six times or until all the hole is cleared of the chippings or other sediment, then lower the drill down to within 18 inches of the bottom of the hole. Push the lever latch back and drill down 20 inches farther as before. Don't stop until 10, 20 or 30 feet of water is found, or until it flows above the surface, if you want a flowing well. The drilling can be continued just as well, if there is 100 or 200 feet of water in the well.

FIG. 1. MACHINE FOR BORING TEST HOLES.

Fig. 2. Drill.

Fig. 3. Reamer.

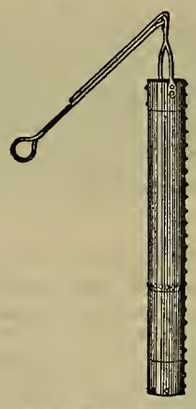

Fig. 4. Sand Pump.

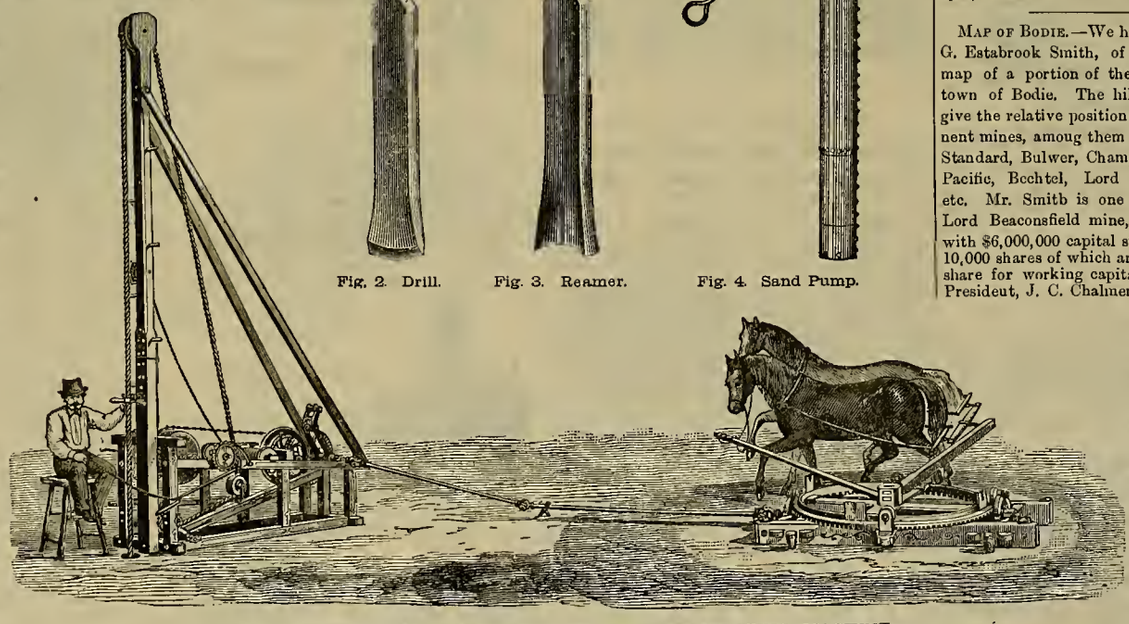

FIG. 5. IMPROVED WELL DRILLING AND PROSPECTING MACHINE.

Fig. 1 represents a drilling machine as used for sinking test holes for minerals, or for boring wells. As the large disk or wheel is rotated, the steel arm connecting it with the drill-rod is carried upward. The arm in being raised, clamps the drill-rod, and carries the latter up with it. As the arm passes over the center of the disk it turns the drill-rod one-fifth of a revolution. When the arm is directly over the shaft on which the large disk revolves, the arm is released, and the drill-rod and arm fall together. In falling, the arm ceases to clamp the rod which falls freely, allowing the drill to strike a full blow. The drill can be made to strike 50 or 60 times per minute. The disk or wheel represented in the figure is 28 inches in diameter, and the slot made so that the drill is raised 14 inches every revolution. The drill is raised from a deep hole by placing the ring or arm H, at the dotted line, to catch and hold the drill as it is being raised, by the same motion that is used in drilling. The poles of tripod should be 25 feet long, of common rough poles. They are used to rest the drill-rods against after they are drawn up and unscrewed. This saves the trouble of laying them down on the ground and raising them up again. J is two gas-pipe drill-rods 15 feet long, screwed together in the middle. The screw couplings welded in each end are steel. I is a sand-pump.

The tools represented by the foregoing cuts have been patented, and the cuts are copyrighted, by Charles D. Pierce, manager of the Pierce Well-Excavator Company, 4206 Elm Avenue, Philadelphia, Pa.

It is expected that an agent will soon be on this coast, introducing the machinery illustrated in the last two articles.

Rate of Boring.

Under this head nothing can be better than to quote an extract made by Spon* from Andre:

"There are probably no engineering operations in which the rate of progress is so variable as it is in that of boring. That such must necessarily be the case, will be obvious when we bear in mind that the strata composing the earth's crust consist of very different materials; that these materials are mingled in very different proportions, and that they have in different parts been subjected to the action of very different agencies, operating with very different degrees of intensity. Hence it arises, not only that some kinds of rock require a much longer time to bore through than others, but also that the length of time may change within a short horizontal distance. Thus it is utterly impossible to predicate concerning the length of time which a boring in an unknown district may occupy, and only a rough approximation can be arrived at in the case of localities whose geological constitution has been generally determined. Such an approximation may, however, be attained to, and it is useful in estimating the probable cost; and to attain the same end, for unknown localities, an average may be taken of the time required in districts of a similar geological character. The following, which are given for this purpose, are the averages of a great number of borings, executed under various conditions by the ordinary methods. The progress indicated represents that made in one day of 11 hours:

"1. Tertiary and cretaceous strata, to a depth of 100 yards, average progress 1 ft. 8 in.

"2. Cretaceous strata, without flints, to a depth of 250 yards—2 ft. 1 in.

"3. Cretaceous strata with flints, 250 yards—1 ft. 4 in.

"4. New red sandstone, 250 yards—1 ft. 10 in.

"5. New red sandstone, 500 yards—1 ft. 5 in.

"6. Permian strata, 250 yards—2 ft.

"7. Coal measures, 200 yards—2 ft. 3 in.

"8. Coal measures, 400 yards—1 ft. 8 in.

"General average, 275 yards; progress, 1 ft. 9 in.

"Should hard limestone or igneous rock be met with, the rate of progress may be less than half the above general average."

These calculations may be of little service in an entirely new country, but they may serve to impress upon the minds of those engaged in boring, the importance of keeping accurate accounts of the wells bored. The data so gathered may prove of inestimable value to practical well borers, as well as to geologists.

We have made inquiries as to the charges for boring, made by contractors. Their charges are so irregular, that any attempt at general calculation would be utterly futile.

We call special attention to the most complete article on "Artesian Wells in Stanislaus County," published in another column."

*The Practice of Sinking and Boring Wells. Ernest Spon, London.

MAP OF BODIE.—We have received from Mr. G. Estabrook Smith, of Bodie, a litbographic map of a portion of the Bodie mines and the town of Bodie. The hills are shown so as to give the relative position of the various prominent mines, among them the Bodie, Belvidere, Standard, Bulwer, Champion, Enterprise, Con. Pacific, Bechtel, Lord Beaconsfield, Croesus, etc. Mr. Smith is one of the owners of the Lord Beaconsfield mine, recently incorporated with $6,000,000 capital stock, in 60,000 shares, 10,000 shares of which are being sold at $1 per share for working capital. John D. Barry is President, J. C. Chalmers Vice-President, and F. E. Leety Secretary. They are down on the mine, Mr. Smith informs us, about 100 feet, with good prospects in the drift. Some of those interested were formerly in the Standard and Belvidere. This company sunk the shaft themselves. The mine is on the south side of Bodie bluff, 300 feet below the Bechtel, on the opposite side from the Bodie. The ledge has been struck in the bottom of the shaft, and Mr. Smith feels certain now of developing a first-class mine.

THE Tuscarora *Times-Review* says that bullion valued at more than $975,000, has been shipped from Tuscarora this year, up to the first of November.

AN average of 500 cords of wood is consumed each month at the Silver Hill mine. The wood costs $9 per cord.

Mining and Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the lar gest west of the Mississippi), are constantly increasing. These facilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

REGISTER YOUR TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

DEWEY & CO., Patent Solicitors,

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

A Library for Inventors.

We have at our patent offices, No. 202 Sansome street corner Pine, a complete set of Patent Office reports, containing engravings and claims of EVERY PATENT ever issued in the United States.

We have also a completo set of the MONTHLY VOLUMES issued by the Department, with full detailed description and large drawings of all the patents issued since the time when these volumes were first published.

A set of all the LAW BOOKS ON PATENTS is also on our shelves ready for reference. We have also the British Commissioners reports, Canadian Patent Office reports for all British North America, full files of MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, *Scientific American*, *Scientific American* supplement, *American Artisan* and other American and foreign scientific and mechanical journals, as well as mechanical dictionaries chemistries, cucyclopedias, and other works of reference.

Inventors and patentees are WELCOME TO EXAMINE at their leisure any of the books in the above sets, and we shall be glad to give them any assistance in hunting up what they want.

Our library is the most complete of its kind on the Pacific Coast in every respect, and we are continually adding to it as occasion demands. DEWEY & CO.,
Patent Agents and Publishers,

To Mill and Mine Owners.

Having complete arrangements with competent and reliable parties in Washington City, by which we are able to secure prompt and careful attention to law business there, we are prepared to assist Mill and Mine, Canal and Ditch owners in securing patents for their lands, mines and claims, in addition to our general line of patent business.

Many who are acquainted with the manner in which this business has heretofore been conducted, (with or without assistance by local attorneys), will see at once the great advantage of patronizing an establishment that is thoroughly organized and has its representatives in Washington to look after and prosecute their applications before the Commissioner of the General Land Office. The business on this Coast will be attended to personally by a member of our firm, and satisfaction will be given in all respects.

Correspondence from persons desirous of securing patents for Lands, Mines, Mill Sites, Canal and Ditch property, promptly attended to.

DEWEY & CO.,
Solicitors of Patents for Lands, Mines and Inventions, MINING AND SCIENTIFIC PRESS OFFICE, No 202 Sansome St., San Francisco

ARITHMETIC MADE EASY
BY ROPP'S
Easy Calculator.

This valuable work is used by thousands of farmers, mechanics and business men, and is highly recommended for its practical utility and convenience.

It embodies an entirely new system of calculation, by which a vast amount of figures and mental labor—required by the ordinary methods—and fractions with their complexities, are absolutely avoided.

It is so simple and easily comprehended that even the most illiterate is enabled, in a few minutes, to reckon with absolute accuracy and speed; while its original and rapid methods, benefit and delight the most scholarly.

It shows at a glance the accurate value of wheat, corn, rye, oats, barley, cattle, hogs, hay, coal, lumber and merchandise, from one pound to a car load, and for any price the market is likely to reach.

It gives the interest, simple and compound, on any sum, or any time, at six, seven, eight, and ten per cent.; the exact measurement of boards, scantlings, timbers, saw logs, cisterns, tanks, wells, granaries, bins, wagon beds, corn cribs, etc., the wages at various rates, for hours, days, weeks and months; besides numerous other important methods, rules and tables.

It is printed on fine tinted paper, is well and elegantly found in pocket-book shape, and accompanied by a silicate slate, pocket for papers, and memorandum, which can be replenished in the two latter styles.

It answers the purpose of a pocket book and diary, and costs no more, although it was gotten up at great expense and labor, and is unquestionably one of the most useful publications ever issued from the press.

Price, bound in Fine English Cloth, $1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted ny express. Address

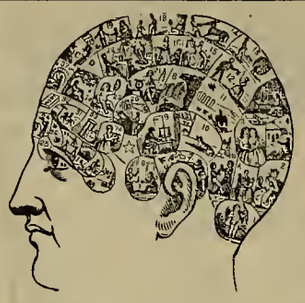
DEWEY & CO., San Francisco.

UNITED STATES
Mineral Land Laws, Revised Statutes,
AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Surveys; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suits is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, postfree, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,
Publishers of the MINING AND SCIENTIFIC PRESS, S.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the lights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.



Barlow J. Smith, M. D.
Consulting Physician,
Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervo-vital derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined phootograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

FRED. M. PATRICK, Manager.

Important to Contractors
— AND —
SUBMARINE BUILDERS.

WILLIAM STACK, of Oakland, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an apparatus for driving nails or spikes under water, an engraving of which is here shown. It is well-known that it is extremely difficult to drive nails or spikes under water, even if it is only submerged a few inches. These difficulties are completely obviated by Mr. Stack's device, which has been put in thorough practical operation in the construction of wharves and lips in the Oakland side of the bay.

Fig. 1 shows the application of the device, and Fig. 2 shows the construction. *A* is a metal tube of suitable length, the foot of which may be serrated as shown, so that the points will engage with the wood when the tube is pushed or driven against it. The rod or driver, *C*, has a recess or cavity, *D*, at the lower end so as to rest on top of the nail or spike shown in Fig. 2. Where the tube, *A*, is pushed against the timber in the desired position, the spike or nail is dropped in at the upper end and slides down against the timber. The rod, *C*, is then slid down on top of the nail, and by alternately drawing out and forcing the rod into the tube, the rod serves as a driver; or by hammering on the upper end of the rod the nail is driven into the wood. The tube answers both as a guide for the nail and driving rod. The tube can also answer as a guide for a screw-driving device on the end of the rod, by which lag screws may be put in place under water as well as nails. Of course the tube may be set in any position desired, so that nails may be driven at an angle if necessary. The appliance, as simple as it is, will be found very useful in many cases for bridge building or similar purposes. Address,

WM. STACK,
N. E Cor. Fifth and Harrison Sts., OAKLAND, Alameda County, California.

18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

The Only SAFE BOILER.

SAVES One-half the FUEL Consumed by Others.

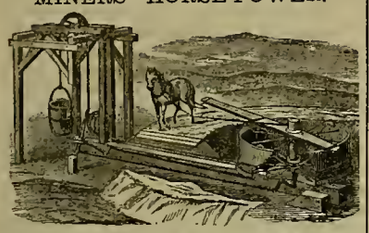
The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for Irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,

18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, $7.50. Postage, 50 cents extra.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,
North Bloomfield, Nevada Co., Cal., October 1st, 1878.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

JACKSON & CO., Mfrs., Petersburg, Va.

L. & E. WERTHHEIMER, Ag'ts, San Francisco

Continued from page 325.

ths other in a southerly courss. The south drift has been gradually curved to ths westward until at a distance of 25 feet west of ths station it has cut into tbe ore vein at very nearly right angles to its course. Up to this morning at 6 o'clock the bottom of the drift had penetrated the ore vein a distance of seven and a half feet, the whole face heing in ore. The ors at ths top of the face of the drift next to ths cap rock assays $15 to $25 per ton, and then gradually increases in richness until the last three feet at the hottom averages from $100 to $500 and $600 per ton, and will probahly mill $150 to $200 per ton. What lies heyond that no one can tell, hut this much cannot only he attested by the writer of this articls, hut hy dozens of the best experts and judgss of ore on the Comstock, who have visited the mines since yesterday morning. At the 2100 level west crosscut has penetrated the cap-rock and is just entering the ore vein with every prospect of encountering tbe same rich vein of ore in the next thres to five feet. The ore in the face of this drift this morning assayed from $20 to $140 per ton. The ore prospects of the mine eo far as a fair and unhiased, honest expression of the judgment of the hest mining judges of Comstock can he ohtained is all that it has been represented herctoforc, and there hardly remains a douht of the development of a large hody of rich paying ore when the crosscut shall have been advanced. Sinking the perpendicular winze helow the 1700 level is making the usual fair rate of progress.

Leviathan.—Ou the 750 level the north drift is still driviug ahead in the foot wall of the ore vein, and passing through occasional feeders of low grade ore. Nothing new in the south drift, same level.

California.—Daily yield of ore, 315 tons. There is no change of interest in any of the ore-producing sections of the mine. The north drift on the ore streak on the 1950 level still continues in good ore, although the vein is very narrow and so far does not show much of a disposition to widen.

Con. Virginia.—The main south drift on the 1950 level is making good progress, the face in veiu matter of a fine, favorahle character. There are no changes of interest to report of either of the crosscuts on this level. Crosscut No. 2 and the maiu southwest drift ou the 1500 level are being steadily advauced without change of value to note. The east drift on the 1400 level is making good progress, and is now in 277 feet.

Ophir.—The main incline has now reached the 2200 level, at which point a station is heing opened. The north drift on the 2000 level is steadily advancing, the face in the eame favorahle character of ore.

Bullion.—Sinking the main incline helow the 2050 level is making good progress, the hottom still in a fiue character of quartz and vein matter. An east drift has been started on the 2050 level to cut and prospect the vein at tbat point.

North Bonanza and Flowery.—The development in the crosscut east from the upper tunnel is still improving with every foot advanced towards the hanging wall of the ledge. The last hlast put in threw out richer ore than ever, aud the east clay is still a hundred feet or more away.

Utah.—Sinking the main incline helow the 1350 level is going steadily forward, the hottom in good hlasting ground.

Solid Siver.—Drifting west from the winze sunk helow the tunnel level is being actively prosccuted. It is expected to reach the great west ore vein in 30 or 40 feet further.

Gould & Curry.—In a day or two more it is the inteution to start up crosscut No. 3 on this level on tbe Beet & Belcher south line.

North Con. Virginia.—Sinking the main shaft is heing pushed ahead with all the speed possible, the bottom in good blasting rock and the flow of water light.

Belcher.—Sinking the north incline shaft is making good progress. The main south drift on the 2360 level is being pushed vigorously forward, the face still following the weet wall of the ore vein. Two prospecting drifts, one on the 900 and the other on the 1500 level, are now being run to prove some unexplored ground to the eastward.

Julia Con.—The completion of the drain in the south drift on the 2000 level is heing forwarded with all the dispatch possihle. The heat is already greatly reduced through this means. This will permit of much greater speed in the progress of the drift.

Union Con.—The north drift on the 1600 level will soon he advanced to prospect what appears to be a veritable quartz vein lying across its course.

Mexican.—Sinking the joint Union Con. winze is making steady progress, the bottom in hard hlasting ground.

Justice.—The ore stopes on the 1225 and 1300 levels are looking well and yielding good ore. There are now about 1200 tons of ore in the dump ready to haul to the mill. The Papoose mill is running on ore from the mine and is crushing at the rate of 600 tons per month. The prospecting drifts and winzes are all making good headway without auy change of value to note.

Ward.—The east drift on the 800 level is steadily advancing, the face in ground of favorable character.

Savage.—There is no material change in any of the prospecting drifts or crosscuts on the 2000 level.

Sutro Tunnel.—Ths south lateral branch, toward ths Julia shaft, is steadily advancing.

Trojan.—Ths ors stopes on the second station level are looking well and yielding good ore. The northeast drift on the third station level is in 358 feet, the face in ore that assays an average of $15 per ton.

Succor.—Ths prospecting drifts on the 1050 level are making good progress, with vary favorahle ore prospects.

Morning Star.—Ths face of the ore-vein has been reached, and preparations ars heing made to sink a winze on the ore in the tunnel.

Crown Point.—No change of valus to record.

Alta.—Sinking the winzs helow the 1450 level is making steady progress, the hottom in ore of a fine quality. The ore in the north drift on the 1550 level continues to show a steady and favorahle improvement.

Golden Standard.—Good progress is being made in sinking ths east shaft. The surface grading is completsd, and the construction of a temporary huilding, for winter, will he next in order.

Exchequer.—Work was resumed in tbe face of the Exchequer ground this morning.

Chollar-Combination Shaft.—Everything will he in readinese to begin the pumping of water at no very distant day.

Benton Con.—On the 1250 level a fine hody of quartz carrying some good ore, has been developed.

New York.—No change of value to record.

Con. Superior.—The main tunnel is heiug steadily advanced.

Atlantic Con.—The shaft must soon reach the main ore vein.

Con. Imperial.—Sinking the south winze helow the 2400 level makes good headway, the hottom still in favorahle quartz carrying streaks of low-grade ore.

Caledonia.—The east crosscut on the 1600 level has heen steadily advanced during the week, the face in hard, shelly rock, the eeams of which are highly charged with bad air, whicb has created some trouhle. The north crosscut is being gradually driven ahead, the face in quartz and porphyry.

Hale & Norcross.—The east drift on the 2000 level is heing advanced rapidly.

Yellow Jacket.—The south drift on the 2400 level is heing pushed ahead, face in ledge porphyry with streaks of quartz.

Kentuck.—A considerable quantity of ore which will mill from $20 to $25 per ton is heing taken out of the drifts and workings of the old upper levels. A good streak or two of ore has heen encountered on the 800 level and an upraise started to prove their value.

Silver Hill.—Cutting out for the 1100 station is making good progress. The south drift on the 900 level is steadily advancing, the face in favorahle vein material.

ARIZONA.

Globe District.—*Silver Belt*, Nov. 7: The outlook for the McMillen lode at the present time is certainly hrilliant. The Stonewall Jackson, in their main shaft, at a depth of 170 feet, have struck a four-foot vein of $2,000 ore. The ore is chloride, silver glance, native eilver and sulphuret. The Julius and Chloride mines are included in the purchase made hy A. C. Hesing, of Hayes & Buck. Mr. H. has gone to Chicago to make arrangements for developing the property. Mr. P. McGorrish reports some good miues in tbe Dragoon and Chiricahui mountains, hut the country is not thoroughly prospected. The main working shaft of the Hannihal is down 160 feet. The crosscut from that level to the foot-wall, at which all the rich ore of the McMillen is found, is expected to show up well. We learn that a good hody of ore has been struck in the Gorman shaft, on the north end of the Hannihal mine, at a depth of 100 feet. Its extent has not yet been determined, but so far as prospected it looks most eucouraging. The ore is a silver glance and assays $1,000 per ton. The Stonewall S. M. Co. have, at the depth of 30 fect, struck a vein in the Florence mine of one foot in width. The mine wae regarded as valueless and no attention paid to it until now. It is a distinct lode from the Stonewall. The supposition is that the company will now develop it. We understand that A. C. Hesing, of Chicago, intends to introduce the lixiviation process, now so generally adopted in Europe and elsewhere, for the reduction of oree.

Items.—The Golden Star mill, Cave creek, has started up with good prospects. Hon. C. C. Bean has gone to San Francisco to procure a roaster for the Aztlan mill, and a mill for the Davis mine. Three feet of solid, rich chloride ore has been struck in the 300 level, main incline of the Tiptop. Ahout seven mines of the Oro Blanco district have recently heen sold to Eastern capitalists. The pulp assay from the Tiptop battery has heen averaging for tho past three months from $200 to $220 per ton. Prospects in Humhug district are described as "flattering heyond description." Great activity prevails at the Arivaca. The Oro Bonito will have a quartz mill running within 40 daye. The Tiger, Oro Bonito, California, Benton, Cougar and Loreno, of Bradshaw, have heen heard from, and the newe is cheerful.

COLORADO.

Items.—It is estimated that through the entire length of 500 feet of levels and crosscuts of the Little Chief mine, Leadville, the ore hody averages 10 feet in thickness; 150 ounces silver to the ton. The output is regularly ahout 25 tons every 24 hours; has run as high as 40 tons. In the lower workings of the Adelaide, a vein has bsen uncovered which yields 560 ounces silver, nine ounces gold and 40% in lead per ton. The last run of ore from the drift on the 60 level of the Vulcan mine, Clear Creek county, yielded 341 ounces for first-class and 162 ounces for second-class. The ore hody is large. The last run on Hurst & Albright's ore, from Frosthurg lode, gave 213 ounces silver per ton. The latest important Leadville discovery, the Chrysolite, shows 26 fest of high-grade ore. Tooker has honded his intsrest in the Duncan lode, Lsadville, to G. W. France, in the sum of $4,000. A recent shipment from the Ready Cash mine, Leadvills, owned hy Tucker & Honx, gave a mill return of over 300 ounces in silver and 11 ounces of gold per ton, ths quantity hrought down heing 5,111 pounds. This ore was taken from the mine while sinking a shaft 12 feet on the vein upon which ths mine is located. The Devlin mine, Leadville, owned hy John Devlin, McMillen Bros. and Frank McGuire, has bssn bonded for the sum of $65,000.

IDAHO.

Atlanta. — *Statesman*, Nov. 14: Mining prospects are reported as decidedly brightening. The Monarch company are taking out first-rate ore from their main level. The Buffalo mill has an engagement to crush 500 tons of this the coming winter. The ore is now heing hauled to the mill. The Buffalo company's hoisting works are a splendid euccess. The main shaft will soon be down 300 feet below the level where the hoisting works are erected. When this point is reached a crosscut will he run to strike the ore-hody. Mr. R. B. Brown has purchased an interest in the principal mine in the Queen's river district, 10 miles north of Atlanta, for which he has paid $10,000, and he has now a force of 10 men at work on the mine.

A Curious Mine.—*World*, Nov. 12: The Toronto mine, near Bonauza City, is a curiosity worth seeing. There is a ledge of yellow porphyry two and a half or three feet wide, but it does not contain a particle of quartz except in one place. The discoverere noticed on the ledge a round hatch of quartz about the size of the crown of a man's hat, and on examination found that it was exceedingly rich in gold. Work was immediately commenced to develop the mine. It has the appearance of a badger hole being filled with quartz, which some supposed it to he when first discovered. The owners have followed down on this hole a depth of 40 feet and the rock contiuues rich. It goes down with the dip of the porphyry vein, but does not dip towards either end of the vein. At the lowest depth attained it has widened to a foot and a half in diameter. One run of 2,800 pounds of ore yielded $2,800. The most astonishing feature is that in the porphyry vein there is not a color of either gold or eilver. The quartz is decomposed aud filled with fine pebbles. The opening is lined with a sheet of quartz about one-eighth of an inch in thickness, the inner surface of whicb ie yellow with gold ; with tbe exception of this tbe lining does not contain a color.

UTAH.

Bingham's Pyrites Belt.—Salt Lake *Tribune:* The shaft on the Mayflower mine, at Bingham, is now down helow any of the gulches in the vicinity, yet no water has heen encountered. This is remarkable, as the shaft is quite a depth in pyritee of iron of the rankest kiud, and up to this, wherever in West Mountain district, water was struck, pyrites invariahly made its appearance. This was the case in the Winnamuck mine, for while einking the new working shaft, the workmen were driven out hy water. The company, for some reason, sold the hoisting machinery to the Ontario, and abandoned the project of sinking after expending thousands of dollars in erecting huildings, pumps, etc. The Utah mine, Last Chance, Grecian Bend and the Old Telegraph group, the Ashland, Neptune and Kempton—in fact, every mine in Bingham shows that water and pyrites go together. That the Mayflower miners will succeed in einking through the iron helt without encountering water, is douhtful.

Tuscarora Ore.—*Tribune*, Nov. 17: Ore from the Revenue mine sampled in Salt Lake city as follows: First-class, $1,266; second, $611. There is a vein of two feet of the former and four and a half feet of tbe second-class, while there ie a third vein 20 feet wide assaying $200 to the ton. He finds an excellent market in Salt Lake for hie ores, and will ship the product of the Revenue here. Tuscarora, which met with some reverses last spring is again on the road to prosperity.

Stewart Mine Started.—*Tribune*, Nov. 12: Operations at the Stewart mine and mill in Bingham have commenced in earnest. The mill was started up with ten stamps on Friday on gold ore, and is now working most heautifully. The other ten etamps will he started in a few daye. The expense of mining and milling the ore is ahout $5.50 per ton while only ten stamps are being run, hut when the full battery is started the expense will not exceed $3.50, and the ore will average about $15. The owners of this mine are Gilmore & Salisbury.

Items.—It is underetood that Alex. Majors holds a six months' hond on the Big Bonanza mine of Beaver county, for $5,000,000, which amount has heen deposited. The Ely mill—formerly the Shoehridge—in Tintic, has etarted up with 10 stamps on custom ores. The *Tribune* says that if the sale of the Horn Silver mine takes place, it will be the most important mining sale which has occurred on the Pacific coast since the days of the negotiation of the Emma.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[Faom Official Rsports for tha Mining and Scientific Press, DEWEY & CO., Publishsrs and U. S. and Foreign Patent Agents.]

By Special Dispatch from Washington. D. C.

For the Wsek Ending Novsmbsr 5th, 1878.

Car Axls Boxss—Robert C. Brown, Portland, Ogn.
Pruning Implsments—Wm. R. Rose, Olennville, Cal.
Couplings for Hydrant Suctions—James Stoddard, S. F.
Bullet Machinss—Samuel L. Loomis, San Jose, Cal.
Rotary Ors-Stamps—Dock E. W. Taylor, San Bernardino, Cal.
Hydraulic Mining Apparatus—George W. Cranston, S. F.
Liquid Freezsrs—William H. Mansfield, S F.
Rolls for Reducing old Iron Railway-Rails—Burroughs P. Brunner, S. F.

Notices of Recent Patents.

Among the patents rscently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Rotary Stamp Mill.—Dock E. W. Taylor, San Bernardino.—Dated, Oct. 5th. We described and illustrated this invention in our issue of March 30th, 1878. In hricf, it consists in the employment of a series of stamps of peculiar construction, fitted so as to project radially from the perimeter of a drum or pulley of snitahle size, which is mounted on an axis so as to he rotated hy any power. Below this drum is placed the mortar into which the stamps are allowed to drop. The stamp-stems are provided at tbeir inner ends with tappets which move upon and are supported hy a curved flange adjustably fixed to the frame, so that the stamps will he held up until the point is reached, when they are required to drop. After tbe hlow has heen given tho tappets are secured on a curved incline, in the shape of a cam, and as the drum revolves, this incline brings the stampe gradually towards the center again, eo that when they have reached the top, the tappet is ready to be transformed to the other flange without jar or noise. The invention also contemplates an improved method of guiding and steadying the stamp-etems, for adjusting the guides and boxes, and a means for regulating the parts to accomodate the wear of the stamps. It also relates to an improved method of securing tho screene and otber details.

Hydraulic Mining Apparatus.—Geo. W. Cranston, S. F.—Dated, Oct. 5th. Tbis invention relates to certain improvements in the hydraulic mining apparatus patented hy the same inventor Dec. 12th, 1876, and which we described in the Press of Jan. 13th, 1877. In the former patent we described the pipe conductor, through which the earthy matter was forced hy the hydraulic stream, as having an enlarged chamher formed in it directly in front of the hydraulic nozzle. It is found by experience that this chamber must be larger or smaller according to the nozzle employed and the quantity of water delivered to it. When a sufficient head of water can he ohtained in the winter season, a large nozzle is used and the machine run to its full capacity; hut when the supply of water decreases in the summer a smaller nozzle must he used and the chamher in the conducting pipe decreased accordingly. To avoid the necessity of removing the nozzle section of the conducting pipe and eubstituting one with a smaller chamber, when this contingency does occur, Mr. Cranston has devised a simple arrangement for filling a section of the chamher space. In connection with thie improved hydraulic current elevator and mining sluice, he has also arranged a waste way hy means of which he oan draw off from the flnme or sluice a portion of the water after it has been utilized for raieing the tailings or earthy matter, and conduct it back into the tail of the machine where it can he re-used as a diluent for the new matter which enters the conductor pipe. In operating this machine it is also employed ae an amalgamator, hy introducing quicksilver into the auriferous material at the tail of the machine, eo that the action of the current as it forces the material up through the elevator pipe or conductor with the free metallic particles, and amalgamation will result. In connection with this amalgamating process, an open grating or undercurrent is conetructed in the hottom of the flume at the upper end of the elevator, so as to withdraw the heavier portions of the material and quicksilver after it has once passed through the elevator, and hy means of a side sluice conduct it hack into the tail of the machine so it will he subjected repeatedly to the amalgamating powers. Mr. Cranston's device is intended for use in mines where there is not fall enough to carry off the dehrie hy natural grade.

Pruning Implement.—Wm. R. Rose, Glenville, Kern county, Cal.—Dated, Oct. 5th. The invention relates to that class of pruners in which several devices are combined in one implement. It consists in joining together two curved and peculiarly shaped handles so as to form a pair of ebears with a curved edge, also for chopping or pruning; a serrated edge to form a saw, and a projection which answers as a chisel for grafting purposes, all combined in one implement.

News in Brief.

A CASE of small pox at San Francisco.

A RIOT in Mount Sterling, Ky., Nov. 18th.

THE Macedonian insurrection is spreading.

LUMBER sells at $75 per thonsand in Bodie.

A HEAVY earthquake in Columbia, is reported.

THE innndation has closed many shops of Rome.

MORE of the Moilie Maguires are to be executed.

THE Britishers don't like Beaconfield's mystorious policy.

OREGON exports avorago about $100 for each inhsbitant.

Two Central Amorican volcanoes aro in tremendous activity.

THE depression in the cotten trade is stopping many English mills.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

General Robert Allen Silver Mining Company.

—Location of principal place of business, San Francisco, California. Location of works, Pinal County, Arizona.

Notice is hereby given that at a meeting of the Board of Directors, held on the 29th day of October, 1878, an assessment of twenty-five (25) cents per share was levied upon the capital stock of the corporatiou, payable immediately in United States gold and silver coin to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the second day of December, A. D., 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the second day of January, 1879, to pay the delinquent assessmeut, together with costs of advertising and expenses of sale. By order of the Board of Directors.

M. C. SOUTHARD, Sec'y.

Office, No. 411½ California street, Room 11, San Fraucisco, California.

POSTPONEMENT.—The delinquent day of the above named assesament has been postponed until the seventh (7th) day of December, 1878. By order of the Soard of Directors. M. C. SOUTHARD, Sec'y.

Land Purchasers' Association.—Location

of principal place of business, San Francisco, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1878, an assessment of four (4) dollars per share (being a part of the 43d installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at No. 641 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Saturday, the fourth (4th) day of January, 1879, to pay the delinquent assessment, together with cost of advertising and expeases of sale. By order of the Board of Directors. O. S. WRIGHT, Sec'y.

No. 641 Sacramento St., San Francisco, Cal.

Mineral Fork Mining and Smelting Com

pany.—Location of principal place of business, San Francisco, California. Location of works: Big Cottonwood District, Salt Lake County, Utah Territory.

Notice is hereby given, that at a meeting of the Directors held on the 31st day of October, 1878, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 20, Safe Deposit Building, No. 322 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventh day of December, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 3 th day of December, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

OTTO METCHKE, Sec'y.

Office, Room 20, Safe Deposit Building, No. 328 Montgomery street, San Francisco, Cal.

Mount Jefferson Milling and Mining Co —

Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1878, an assessment (No. 5) of five (5c.) cents per share was levied upon capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 316 Pine St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fifth (25th) day of November, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the seventeenth (17th) day of December, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine St., San Francisco Cal.

New Basel Con. Gravel Mining Company.

—Location of principal place of business, San Francisco, California. Location of works: Placer County, Cal.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 4) levied on the 24th day of September 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
G Mahe.....	6061	1500	$75 00

And in accordance with law and an order of the Board of Directors made on the 24th day of September, 1878, so many shares as may be necessary of each parcel of such stock will be sold at public auction at my office, rooms 5 and 6, No. 434 California street, San Francisco, California on the Eighteenth (18th) day of November, 1878, at the hour of twelve o'clock, noon, of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

D. F. LEGAYE, Sec'y.

Office, 434 California St., San Francisco, California.

Summit Mining Company —Location of

Principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 5,) levied on the 10th day of September, A. D., 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
C Lehmanu, Trustee.....	200	5	$ 25

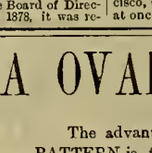
Iron, Steel, Blacksmith & Mining Tools, Etc.

Verv Lowest Market Prices.

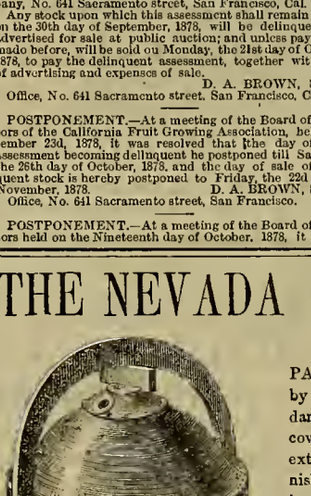


I. S. VAN WINKLE & CO., 413 and 415 Market Street, San Francisco. Importers and dealers in all kinds of Blacksmith and Mining Tools, Shatting, Cumberland Coal, Carriage Bolts, Springs, Drills, Horse Shoes, Borax, Norway Iron, both Boston rolled and our own forcign importation direct, Horse Shoe Nails, Etc. All at the very lowest market prices. Good treatment assured. Give us a call.

ANNUAL MEETING.

THE ANNUAL MEETING of the stockholders of the Gold Bar Gravel Mining Company, for the election of Trustees for the ensuing year, will be held at the office of the Company, Room 28, Stevenson's Building, San Francisco, California, on Saturday, December 7th, A. D., 1878, at one o'clock P. M. O. D. SQUIRE, Sec'y.

THE NEVADA OVAL TOP RETORT.

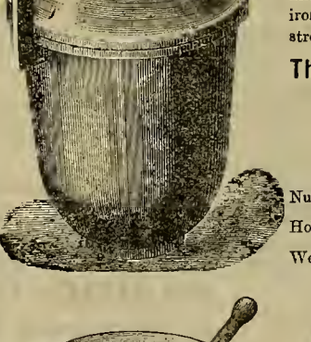


The advantage of this Retort over the OLD FLAT PATTERN is, that it can be filled full of Amalgam, thereby holding more than the old style, besides avoiding all danger of an explosion owing to the crown space in the cover which allows for the expansion. They are made extra heavy, WELL GROUND in the joints, and are furnished with a strong Norway clamp, having a wrought iron key which can he driven iu or out of place by a single stroke of a hammer.

The Annoying Thumb-Screws are Entirely Done Away With.

We Make Seven Sizes, as follows:

Number or Pints.....	1	2	3	4	5	6	10
Holds Pounds Quicksilver..	12½	25	38	50	63	75	125
Weight each.....lbs	10	15	18	25	31	44	65



Mortars and Pestles,

GROUND INSIDE.

Size—Quarts.....	½	1	2	4	6	8	12	16
Hight—Inches ...	3½	5	6	7½	8½	9	11	12
Weight—Pounds .	6½	9	16	22	37	43	72	86

Bullion Ladle.

Forged from oue piece of Charcoal Iron, eight inches in diameter hy four inches deep.

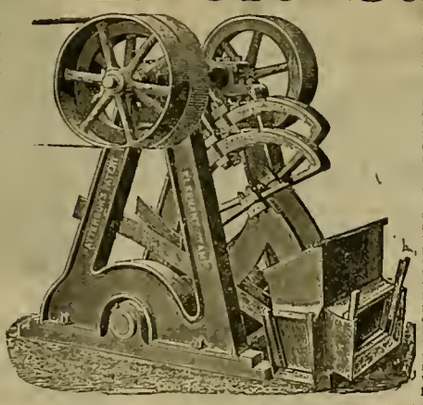
Elephant Ore Stamp.



We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 14 tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Die, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco For particulars, apply to

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, NOVEMBER 30, 1878. VOLUME XXXVII Number 22.

State Ore Deposit Collection.

Mr. A. W. Jackson, Mineralogist of the University of California, has issued a bulletin addressed to the "mine owners, mining engineers and mining superintendents of the Pacific coast." The object of the publication is to solicit the aid of those who are favorably situated, in obtaining for the State an ore deposit collection, to be located at the University, Berkeley.

The object of the University is to give our young men such a training as shall enable them to step from their college walls, better citizens, positive aids to the advancement of our coast. Accordingly, each of the great branches of our industry is represented at Berkeley, in the various scientific colleges. Of these latter, the College of Mines is of paramount importance. And it is to ensure the greater success of this college, that the collection of ores is desired. Such a collection as is wished will enable students to obtain a full, clear and practical idea of what they may expect to meet in the actual working of our mines, making them immeasurably superior to the mere student of books, or even of ordinary mineral cabinets. But, as Mr. Jackson says: "Such an ore deposit collection will subserve even a higher and far more important purpose than instruction. The geological relations of the ore deposits of this coast have never been systematically studied. Much has been learned, it is true, from the examination of separate, isolated deposits; but they have never yet been studied *as a whole;* comparative investigations on a wide scale have never yet been made. They could not be, for it is only by means of such a collection as we are now soliciting that the study could be carried out, and as we said before, it does not exist and has never been made. Ore deposits are subject to *laws;* but it has been found that very few only of these laws are of a *general* character. The results of experience in one country cannot consequently be applied with safety to another. Every mineral region must be studied by itself and the laws of its formation worked out independently. That this has been done to but a limited extent for California and for the Pacific coast at large, is familiar to you all. If we consider for a moment the millions of dollars that have been uselessly expended in prospecting for, and in the development of worthless mining property, the great economical importance of the work proposed becomes at once evident." Thus it is proposed, not only to increase the usefulness of the University to the student, but to make that institution a center from which the results of careful investigations of our ores, may go forth to enlarge our general stock of information and guide our investments.

The following directions for selecting the specimens are given:

Each ore deposit upon the Pacific coast should be represented by hand-specimens in the following manner:

1. By specimens of each of the different ore minerals upon the deposit.

2. By specimens illustrating the *gangue* or *veinstone.*

3. *Contact* specimens of gangue and ore mineral.

4. By specimens of the country rock from both foot-wall and hanging-wall.

5. Contact specimens of vein and country rock.

Then, hand-specimens illustrating any other important geological feature of the deposit should be included; such as a change in the country rock, either in the dip or strike of the vein, the intersection of two or more veins, peculiar selvage phenomena, horses, etc.

The specimens should be selected by competent men. They should be accompanied by any available information with regard to the mine and the surrounding country—the more complete the detail in all respects the better.

It is recommended that the specimens be trimmed to a uniform size, say, 4 in. x 3 in. x 1½ in., labeled with a number referring to an accompanying catalogue, separately packed in paper, arranged together in a box, and forwarded to the *"Ore Deposit Collection, University of California, Berkeley, Cal. Care of Wells, Fargo & Co.'s Express."* Wells, Fargo & Co. will forward parcels so addressed, free of charge.

The receipt of the minerals will be promptly acknowledged. The specimens will be determined. The labels will bear the names of the donors.

This endeavor on the part of the Faculty of our University will recommend itself to all interested in the welfare of the coast, and especially to that class to whom the circular is more directly addressed. No reasonable effort should be spared to render the collection a success.

PRIZE FOR A MILKING MACHINE.—The Royal Agricultural Society of England has offered this year a prize of $250 for an "efficient milking machine," an implement of which Prof. Sheldon, of the Agricultural College of Cirencester, thinks dairy farmers at the present time stand most in need. He considers a milking machine one of the knottiest problems which inventive genius has got to solve, the difficulty being to combine motive power with the adaptability of the machine to all kinds of teats and udders, and which, to be really valuable, must enable a man to milk 15 cows within the hour—milk them cleanly and thoroughly, and without injury to the udder or teat of the cow. The *American Dairyman* thinks the inventive genius of our Yankee nation will be found equal to the problem, and as so much as already been accomplished in this direction, its solution is not likely to be very far in the future.

AN improvement in the Idaho quartz mine, Nevada county, is reported.

Manufacture of Ice.

It has been found by experience that in most localities ice can be manufactured by artificial means, cheaper than natural ice can be cut and shipped to the cities where it is sold. This is especially true on this coast, where the larger cities are remote from the lakes and other places where ice forms, and where transportation is expensive. Various devices have been invented for the manufacture of ice, most of them, however, being very expensive, and requiring a very large space for operating.

A company has recently been incorporated in this city, which has acquired from N. J. West, of London, the sole and exclusive right to manufacture and sell on the Pacific coast his world-renowned ice-making and refrigerating machines, which, although well and favorably known in Europe, has never been introduced on this coast until now. These machines obtained the first-class prize medal at the great exhibition in London in 1862; the prize medal at Vienna exhibition of 1873; and have been supplying ice at the Paris exposition. Apparatus has already been constructed under these patents, which is now in successful operation in Great Britain, in India, and in New York, equivalent to the manufacture of a million of pounds of ice daily.

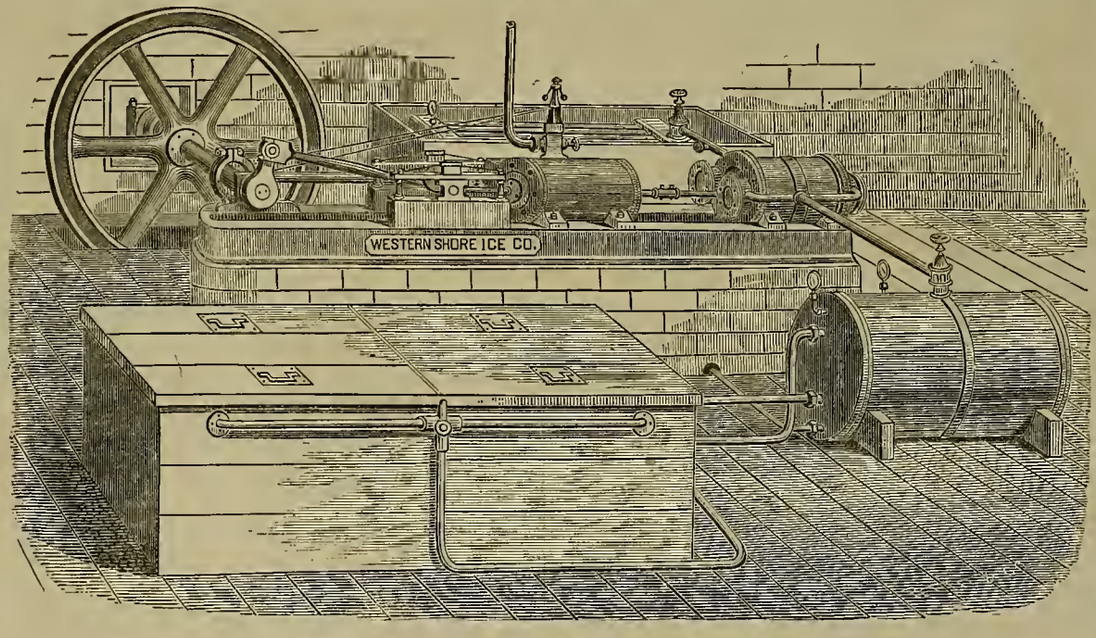
The company organized here is called the Western Shore Ice Company, which is now prepared to supply these machines to hotels, restaurants, clubs, breweries, mines, dairies, country towns, and all manufacturers and consumers of ice on this coast. The accompanying drawing illustrates one of the patent transparent block-ice making machines, manufactured by the Western Shore Ice Co. To this apparatus a very plain and simple steam engine is attached for working the air pump. This is made direct-acting, by which means the use of all belts or gear wheels is avoided. Where, however, a separate motor exists, the machine may be had without the steam engine, in which case there is, of course, a proportionate reduction in the cost.

A one-ton machine of this description will manufacture clear ice in blocks of any desired thickness, from three inches to four feet and upwards, at a cost, we are informed, of one quarter of a cent per pound.

A twenty-ton machine will make the same description of ice at a cost of one-twentieth of a cent per pound. The company state that where power is already on the premises, the cost of manufacture will be less than one-half of the above figures.

Many valuable improvements have been recently made, and the apparatus is acknowledged to be one of the most complete and economical ice-making machines in the world.

Among the various other purposes for which this new patent machinery is valuable, are the cooling of air or liquids, preserving meat, fish, vegetables, fruits, etc., cooling hospital wards, theaters, dairies, mines, and for all purposes where a low temperature is desired. The success attending the introduction of the apparatus is proof of its superiority. The most eminent brewers in the world, including Allsop & Sons, Truman, Hanbury, Buxton & Co., and Guinness & Co., have adopted the system and have 11 of these machines of the largest kind in use, while 38 of them are employed in various other breweries in Great Britain. All machines sold are accompanied by a guarantee.



WEST'S ICE MAKING AND REFRIGERATING MACHINE.

These machines may be used to advantage at our deep mines where large quantities of ice are consumed. They are also very useful in dairies, as the air may be kept at an equable temperature in dairy rooms, and at any desirable coolness. The Western Shore Ice Company are prepared to supply refrigerating machines of a capacity for cooling from 5,000 to 50,000 cubic feet of air per hour to 30° Fahr. Circulars and further information may be obtained by applying to the Secretary of the Western Shore Ice Company, No. 330 Pine street, rooms 61 and 62, San Francisco.

UNDER FAVORABLE AUSPICES.—The Geological, Mineralogical and Mining Section of the Academy of Sciences, organized as a society subordinate to the Academy, begins its life under unusually favorable auspices. It starts out with an endowment, so to speak. It has all the resources of the Academy of Science in that department—a valuable library of special publications, periodicals already collected in its own field, and on the shelves; a pleasant section or room-like alcove in the Academy building, with tables and writing room—exclusively its own—where their books are; a mineralogical and geological collection, to begin work upon; with its share in the prospects of the Academy generally. The section has besides a very comfortable meeting room at Prof. Price's laboratory, where the microscope and other tools have been generously placed at their disposal. Under Joseph Le Conte's influence all the good professional talent on the coast can work harmoniously, and will.

JOHN POE has been prospecting in Sierra county, about seven miles above the Sierra Butte quartz mine. He reports good prospects. A hatch of 50 pounds of his rock produced at the rate of $35 silver and $8 gold. The ledges are well-defined. They contain a little copper and are slightly tinged with galena.

THE Llampaico gold washings are estimated to yield a profit of nearly $17,000,000. The engineer says it will take 124 years to wash away the deposit at the rate of 242,000 cubic yards a year

A VEIN supplying enough gas for lighting and fuel purposes for the Thompson Steel Works, has been struck in a Pennsylvania well.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

That Stick of Timber,

EDITORS PRESS:—In the issue of the PRESS of October 26th, I find an answer to the query of a "Constant Reader," in which there are some errors in calculation as well as typographical. My object is to introduce a much simpler and more abridged method, entirely eliminating from the problem the element of extracting the square root, which is a very tedious operation to the majority of people; and solving the same by the simple operations of multiplication and division, and that by using fewer figures. Using the dimensions of the stick of timber as given by you, I would first obtain the square of the mean diameter. Take the mean of the squares of the two ends, which is 40 inches; also take the square of the middle point, which is 36. Take half the difference of the two numbers and add it to the smaller, or subtract it from the greater; which gives 38 inches as the square of the mean diameter. Or, by another method, take the diameter of each end, the middle, and two intermediate points; which in the present case would be 4, 5, 6, 7 and 8. Square each number separately, and add the results together, which gives 190. This divided by 5, the number of points of measurement, gives also 38 inches as the mean square. Having obtained the mean diameter, we will proceed to make the calculation. Take the length, reduced to inches, which in this case is 264. Multiply by 38. The result is 10,032, which, divided by 144, gives 69.66 as the number of feet of board measure—a little in excess of your figures. To use the diameter 40, as many contend would be right, would give 73.33; and to use 36, as many others declare correct, would give 66 feet; the first of course too large, and the latter too small. Take half the difference as before, and add to the smaller, or subtract from the greater; this gives the result as heretofore found, viz., 69.66. This method is equally applicable to obtaining the cubic contents by using the divisor 1,728, instead of 144. It is often necessary to find the board measure of round timber, or its cubic contents. Suppose we take the same stick of timber, assuming it to be round, with the same diameters; take the mean diameter 38, and multiply by the decimal .7854, which will give the true mean diameter of the round stick, 29.84, and 54.71 feet board measure. The cubic contents would be 4.55 feet; the cubic contents of the square stick is 5.8 feet. To obtain the weight, divide the specific gravity of the timber by 16, moving the decimal point of the quotient one place to the right, and multiply by the number of cubic feet, *e. g.*: Assuming the specific gravity of the squared stick to be $.75 \div 16 = 46.8$, the weight of a cubic foot, $\times$ by $5.8 = 271.44$ lbs as the weight. J. L. C.

Deer Lodge City, Montana, Nov. 4th, 1878.

[With regard to the answer obtained in the issue referred to, we would say that it was obtained by the ordinary rules of mensuration. The volume of the frustum of a pyramid is equal to the sum of the volumes of three pyramids having a common altitude, viz., that of the frustum; and bases respectively equal to the upper base of the frustum, the lower base and a mean proportional between the two. The same answer may be obtained by continuing the sides of the frustum, until a full pyramid is formed, calculating the volume of the whole large pyramid and of the small one formed by the prolongations of the sides of the frustum, and then subtracting the smaller result from the larger. The remainder would be the volume of the frustum, in other words, of the stick of timber. Each of these methods gives a volume equivalent to 68.44 board feet, the result given in our previous issue.

The rule given in Haswell for this problem is: "To the sum of the areas of the two ends add four times the area of the middle section, parallel to them, and multiply this sum by 1-6th of the perpendicular height." Apply this to the problem in question. The sum of the areas of the two ends is $16 + 64 = 80$. The area of the middle section is 36, which, multiplied by 4, gives 144; $80 + 144 = 224$; $224 \times 22 \times 12 \div 6 = 9,856$ = the volume of the stick in cubic inches. To obtain the board feet, divide by 144, $9,856 \div 144 = 68.44$, the same result obtained above. Our correspondent has used a method of approximation, and we are inclined to think that he will find our result not far wrong.—EDS.]

PETROLEUM IN GERMANY.—A flowing well has been struck near Heide, in Holstein, (Germany), as the result of an experimental boring. The *D. A. Polytech. Ztg.* affirms that the product is in all respects equal to the American article.

The Martin White Case.

[Continued from last week.]

Lodes or Veins as such, cannot be Located.

The vein is the principal thing in the sense that it is for the sake of the vein that the location is made; the surface is of no value without it; no location can be made until, a vein has been discovered within its limits, and the surface must or at least ought to be in comformity with the course of the vein. (R. S. 2320.) But the *location is of a piece of land including the vein.*

"A mining claim located after the 10th day of May, 1872, whether located by one or more persons, may equal, but shall not exceed, 1,500 feet in length along the vein or lode; but no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located. No claim shall extend more than 300 feet on each side of the middle of the vein at the surface, nor shall any claim be limited by any mining regulation to less than 25 feet on each side of the middle of the vein at the surface, except where adverse rights existing on the 10th day of May, 1872, renders such limitation necessary. The end lines of each claim shall be parallel to each other." (R. S. 2320.) This section alone shows that it is a surface parallelogram not less than 50 feet in width that must be located. But the purpose of the law is more clearly indicated by its granting clauses. What is it that the locators have the exclusive right to possess? Having complied with the laws they shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations and of all veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface-lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side-lines of such surface locations. (R. S., 2322.) This is the only part of the act which grants the right to possess any lode, ledge or vein. The vein originally discovered, and for the sake of which the location is made, is lumped in with other mineral deposits that may happen to exist within the limits of the surface claim, and no part of it is granted except that part, the top or apex of which lies inside of the surface lines extended downward vertically. This, it would seem ought to be conclusive, but the language of Section 2325, is, if possible, still more convincing; "Section 2325. A patent for any land claimed and located for valuable deposits may be obtained in the following manner: Any person, association or corporation authorized to locate a claim under this chapter, having claimed and located a piece of land for such purposes," may, by taking the prescribed steps, obtain a title upon payment of $5 per acre for the land.

A Location is a Piece of Land.

Thus it appears that a location on a vein must be made by taking up "a piece of land" to include it. No other means are provided, and it is only upon condition of complying with the law that the locator becomes entitled to anything. The discoverer of a vein may be allowed a reasonable time to trace its course before being compelled to define his surface claim, and in the meantime may be protected in his claim to 1,500 feet of the vein, but his location will never be complete until his surface claim is defined.

That this is the only possible construction of the statute seems so plain to our minds that we should have thought it superfluous to say a word in defense of our view if we were not aware that an opposite opinion is very largely prevalent.

Reason of the Mistaken Idea.

We think this is due to the fact that the custom of locating a vein claim by means of a notice posted on the croppings, and of bolding it by record of the notice and work done at the discovery point, without any definition of boundaries, has prevailed so long and so universally on the Pacific coast that the system has come to be regarded by a great many as something essentially inherent in the nature of things. The right, under such locations, to follow the vein in whatever direction it might run, to the extent claimed in the location notice, taking the adjacent surface necessary for the convenient working of the mine as a mere incident thereto, has been so long recognized and enjoyed as to have almost assumed the character of one of the natural and inalienable rights of man. That the Government, in disposing of its mineral lands, has adopted a radically different system, under which a vein can only be located by means of a surface claim, and held only to the extent that it is included within the surface lines, is a thing too incredible to be believed by those to whom the old customs seemed rooted in the very foundations of justice.

Time for an Awakening.

But disagreeable as the awakening may be, it is time we were opening our eyes to the fact that a new system has been introduced. The act of Congress of May 10th, 1872, has effected the changes above indicated. Its language is plain, unambiguous, and whatever may be our opinion of the impolicy of the changes effected by it, we are bound to submit and conform ourselves to its requirements. If the terms of the statute left any room for construction the *argumentum ab inconvenienti* might be entitled to great weight, but it cannot be invoked where the language of the law is so plain as it is in this instance.

The New System a Good One.

Besides, we do not share in the opinion that the new system is so utterly bad. Nobody can pretend that it is a great improvement on the system which it displaced. We are willing to admit that cases may arise to which it will be difficult to apply the law, but this only proves that such cases escaped the foresight of Congress, or that, although they foresaw the possibility of such cases occurring, they considered that possibility so remote as not to afford a reason for departing from the simplicity of the plan they chose to adopt. So far, the wisdom of the Congressional plan has been sufficiently vindicated by experience. It is true that veins and ledges are not found to be perfectly regular in their formation—they have not a perfectly straight course even in depth—and near the surface they present still greater irregularities of strike and dip; but still they approximate the ideal vein that Congress seems to have had in view sufficiently nearly to admit of an easy application of the law in all the cases of conflicting claims that have fallen under our observation.

As to the Difficulty

Of establishing surface lines immediately upon the discovery of a vein, that also is conceded. It is a well-known fact that the croppings of a vein are always a very imperfect and often a very deceptive guide to its course, and it will often be difficult and sometimes impossible to locate a surface claim in conformity with the course of the vein even after years spent in its development.

But all this affords

No Argument Against the System.

Unless the miners voluntarily restrict themselves by local regulations, a claim may always be 1,500 feet long by 600 feet wide. Let the discoverer of a vein be ever so unfortunate in locating his claim he cannot possibly get less than 600 feet of the vein, while under the old law the most he could get was 400 feet. How then can it be said that he is subjected to any hardships? So far from restricting his rights the new law has very greatly enlarged them, and at the same time has made them vastly more certain and secure.

Immediate Tracing not Necessary.

Furthermore, we do not understand that the law requires the surface claim to be defined immediately upon the discovery of the vein. We think that under any circumstances the discoverer, if he went to work diligently to trace out its course, would be allowed a reasonable time for that purpose, and in the meantime would be protected in his right to 1,500 feet of the vein. In the absence of any State or Territorial or local regulation prescribing the time to be allowed for tracing, the question as to what should be deemed a reasonable time would have to be determined in view of the facts and circumstances of each case. We said, however, in the Golden Fleece case (12 Nev., 329), and we still think that this is a matter for local regulation under the power delegated to the miners by section 2324 of the Revised Statutes, to make rules not in conflict with the laws. Any reasonable rule for the provisional holding of a claim, by means of the posting and recording of notice, during the time necessary for tracing would, we feel confident, be favorably viewed by the courts, especially if it required the locator to use diligence in the work of tracing during the time allowed for that purpose. This, however, is a question which we are not called upon to decide in this case. We have been led into this line of argument in response to what has been said by counsel for respondent in regard to the great hardship imposed upon the discoverer of a vein by compelling him to define his surface claim before he could possibly ascertain the course of the vein. If we are right in our opinion that he would be allowed a reasonable time for tracing, the supposed hardship does not exist.

The Old Law no Better.

If we are wrong, and if the discoverer must set his stakes without stopping to trace the vein, even then, as we have shown, he is better off since, than he was before the statute. His surface line will necessarily include at least 600 feet of the vein, and may include upwards of 1,600. In the latter case he may be compelled to readjust his lines so as to take only 1,500 feet, but in any case he can secure 600 feet. Before the statute he could claim no more than 400 feet of the vein, and of that he was not secure for a day. The moment he developed rich ore he was beset by trespassers, and in order to enjoin them from stealing his property, was obliged to trace the vein between them and the location point. He was harassed with litigation, and his means often entirely consumed in the prosecution of work not necessary for the development of his mine, but essential for the vindication of his title. Under the new law this source of vexation and expense is entirely swept away. Within his surface lines the discoverer of a vein is secure, and he might well consent to sacrifice something in the extent of his claim for the sake of that security. So far, however, from having to make such a sacrifice of his claim, at the very worst, is more ample than it ever was before. Sound policy, therefore, concurs with the language of the statute in sustaining our conclusion that a vein can only be located by means of a surface claim. How soon after the discovery of the vein "the location must be distinctly marked on the ground so that its boundaries can be readily traced" (R.S., 2324), we do not decide, but until it is so marked we are clear that the location is not complete and the law has not been complied with.

THE Government has paid the fishery award.

New Incorporations.

The following companies have filed certificates of incorporation:

CABINET CON. M. Co.—Nov. 18th. Location: Nevada. Directors—J. J. Green, E. C. Lloyd, J. P. Cochran, Geo. Burgess and David Wilder. Capital, $10,000,000.

ADRIATIC M. Co.—Location: Flowery district, Storey county, Nev. Capital, $10,000,000. Directors—Joseph Clark, R. N. Graves, C. H. Fish, W. W. Stetson and A. K. P. Harmon.

ARIZONA CON. M. Co.—Location: Tucson district, Pima county. Capital, $10,000,000. Directors—Frank Sbay, C. M. Chase, Moritz Neisser, W. S. Bell and Wm. Sternitzky.

HARRINGTON M. Co.—Location: California and Nevada. Capital, $12,000,000. Directors—J. F. Miller, O. H. Lagrange, A. Hemme, T. F. Cronise and T. B. Shannon.

UNCLE SAM M. Co.—Location: Tombstone district, Pima county, Arizona. Capital, $10,000,000. Directors—A. W. Blair, Wm. H. Bootbe, J. M. Barney, E. G. Boothe and E. A. Trowbridge.

MOUNT ROSE M. Co.—Location: Humboldt county, Nev. Capital, $10,000,000. Directors—H. L. Lightner, B. W. Mudge, F. A. Huntington, R. P. De Noon and W. T. Rohinson.

HEART BASIN GRAVEL M. Co.—Capital, $15,000,000. Directors—Sol. Heydenfeldt, P. J. O'Conuor, Julius Bandmann, J. M. Nougues and J. H. Watts.

RICHELIEU M. Co.—Capital, $640,000. Directors—W. E. Brown, E. S. Miller, David Bush, E. W. Hopkins and E. H. Miller, Jr.

LIBERTY M. Co.—Capital, $10,000,000. Directors—E. B. Pond, E. N. Hall, W. G. Crandall, George Congdon and S. Liukton.

NORTH SIGOURNEY M. Co.—Location: Bodie district. Capital, $10,000,000. Directors—J. C. Wade, A. F. Main, J. C. Shain, F. W. Utter and John H. Daley.

SIERRA NEVADA M. Co.—Nov. 6th. Location: Tuscarora. Capital, $10,000,000. Directors—J. A. Reichert, Hyrum Wilder, L. W. Crane, G. S. Fife and J. H. Van Vleet.

APACHE G. and S. M. Co.—Location: Arizona. Capital, $6,000,000. Directors—E. Worth, C. E. Atkinson, T. E. Atkinson, James L. King and C. Wittrau.

MORISCO M. Co.—Location: California and Nevada. Capital, $10,000,000. Directors—E. O. F. Hastings, H. P. Christiansen, R. C. Rogers, J. P. Garvey and O. H. La Grange.

EMPIRE G. and S. M. Co.—Location: Tulare county. Capital, $10,000,000. Directors—Thomas Fowler, P. W. Murphy, J. R. Arques, Edward Martin and George C. Perkins.

OPHIR S. M. Co.—Location: Arizona. Capital, $10,000,000. Directors—John Henderson, W. Meeks, G. W. Osborn, Samuel McCullough and J. H. Mayhew.

FRANKLIN S. M. Co.—Location: Arizona. Capital, $10,000,000. Directors—John Henderson, W. Meeks, G. W. Osborn, Samuel McCullough and C. W. Kinsman.

MARYLAND CON. G. and S. M. Co.—Location: Bodie district. Capital, $12,000,000. Directors—E. J. Baldwin, A. C. Dunn, C. W. Fox, D. L. Smoot and John A. Rice.

UNITED G. Q. BONANZA Co.—Location: Volcano, Amador county. Capital, $500,000. Directors—Charles McLaughlin, Tully R. Wise, George W. Newhall, Maurice Casey, Lewis Lamherton.

CLARA CON.—Location: Dakotab. Capital, $10,000,000. Directors—S. Heydenfeldt, Alpheus Bull, J. W. Gashwiler, Thomas Bell and W. H. A. Mason.

BODIE RICHMOND M. Co.—Nov. 16th. Location: Bodie mining district, Mono county, Cal. Directors—I. F. Miller, President; O. M. Cummings, V. President; E. L. Willard, Treasurer; O. D. Squires, Secretary; I. D. Wright. Office, 331 California St., Room 28, Stevenson Building.

BRANNAN M. Co.—Location: Nevada. Capital, $10,000,000. Directors—Samuel Purdy, S. K. Theller, B. S. Bernard, E. N. Hooper and J. S. Luty.

CAHAWBA G. M. Co.—Location: Tuolumne county. Capital, $3,000,000. Directors—C. W. Kellogg, H. L. Coye, F. W. Hadley, J. J. Mane and Isaac D. Huntoon.

MAGENTA M. Co.—Location: Bodie district. Directors—C. T. Hutchinson, Andrew J. Moon, Charles Jost, John F. Lohse and Louis Franconi.

WHO WAS THE FIRST HYDRAULIC MINER?—Mr J. S. Phillips has been at some pains to discover the name of this historic individual. He believes that he has succeeded. He says, in his "Explorers', Miners', and Metallurgists' Companion," speaking of hydraulic gravel mining: "This really magnificent system was first devised and practically applied in California, but I regret to say that I had considerable difficulty in obtaining the name of the man, as he, like Marshall and Comstock—the discoverers of gold in California, and silver and gold in Nevada—has been sadly neglected by those few whom he has directly enriched, as well as by the millions of his fellowmen indirectly benefited by his very determined and useful energy, and practical skill. I am informed by Mr. R. R. Craig, of San Francisco, that Mr. Edward Mattison was the first to apply the power of water for such a purpose under a 60 feet head of pressure, as passed through a small nozzle of at first only three-fourths of an inch in diameter, on a gravel bank at the American Hill mining claim, situated about one mile west of Nevada City, Nevada county, Cal."

MECHANICAL PROGRESS.

Progress in Tools for Accurate Measurement.

Eastern mechanical writers assure their readers that there has been, of late, as much, or more, improvement in tools or instruments for measuring as any one branch of mechanics' tools. Only a few years ago the vernier callipers were comparatively unknown, and working to the one-1000th part of an inch a myth; now, in almost every machine shop, the vernier is a common tool and everything of any importance is measured by it. Standard gauges in the form of cylinders for both outside and inside measurement have been in use in some of the larger and better equipped shops, but have not come into general use on account of their cost. They are made now at more reasonable rates, and should take their place in every shop, seeing that they will be found to more than pay for their cost in the time saved in working up the accurate sizes. The gauge should never be allowed to go into the shop to be used in common, but be kept for reference, and for setting slide gauges. Used in this way they will last a lifetime and retain their accuracy.

Screw thread gauges are now made adjustable, and can be used for fitting threaded work, as they can be closed together even when worn; and in connection with the screw thread gauge is the V or angular gauge of 60 degrees for grinding threading tools and also for turning lathe centers. The practice of grinding threading tools and turning off lathe centers without this gauge—and by the eye only—should never be allowed. "Snap," or calliper gauges are now made very cheaply and accurately, one variety having both outside and inside measurements. Such tools will pay for their first cost in a year.

The idea of making everything to a standard measure should be encouraged in every way possible. The advantage of interchangeable work can hardly be counted in dollars and cents; for instance, imagine every maker of gas pipe to have his own standard of sizes and thread; why the confusion at the Tower of Babel was nothing compared to what it would be if this "no standard" system were to prevail. It would be but little worse than the loose way in which the general run of shops make some of their work—the system of making bolts and nuts, for instance.

A BALL SAFETY-VALVE.—A recent English invention has for its object the adaptation and application to steam-boilers of an entire ball, for the purpose of a safety-valve for the escape of steam as required, such valve being capable of being moved repeatedly, so as to present a fresh face to the seating, and thereby economize the use of the valve. And his invention consists in the use of a ball made of brass, or other suitable material, resting on a seating of steel or other suitable metal or substance harder than that of the ball, and pressed down as required on to the seating by means of a weighted frame capable of swinging freely on the ball. This ball is sufficiently large in diameter to admit of its being moved a number of times on its seating, so as to present each time it is moved a fresh face to the seating, no one face intersecting another. The ball may also be moved at convenient intervals before being worn on any one face. The valve or ball is weighted with ordinary dead weights, but the frame by which the weights are suspended, instead of being fast to the valve, as usual, is made to swing freely on the ball at the top by means of a center piece of suitable concave form, lined with soft metal or other suitable material, to prevent injury to the ball.

MOLTEN CARBONATE OF SODA IN PUDDLING.—The *Iron Age* translates from a French authority an account of the efforts which E. Vanderkeyn has made to use molten soda in puddling. He states that the main benefit to be derived is the elimination of silicon, especially from coke irons, and that experience has taught him that 2½ times the amount of silicon in carbonate of soda is sufficient. The best time to charge the alkali is 3 or 4 minutes before the iron comes to nature, care being taken to close the damper so that the powdery material is not carried off by the draft. Mr. Vanderkeyn has also found that phosphorus and sulphur are reduced in amount, and he considers the manufacture of high-grade iron from ordinary pig possible by the use of alkalies. Inferring from experience in the metallurgy of another metal, we would add that the purifying action of molten caustic alkalies is still more energetic.

ELECTRIC LIGHT ON A VELOCIPEDE.—The electric light is evidently choosing many methods of coming forward. We read that it has been successfully applied to the bicycle by an enthusiastic Englishman. The monitor is the hind wheel of the bicycle and the apparatus a small ordinary magneto-electric machine with rotary magnet, aided by a small pocket battery. The carbons are regulated by a train of wheels, worked by the front wheel of the bicycle, the consumption being about one inch per hour. The apparatus takes up the room of a small valise, and costs in all about $25. The light is steady and equal to 120 candles, its great advantage being that it lights up the road thoroughly for 200 yards ahead on a dark night.

Fixing the Quality of Boiler Plate.

It seems that sharp competition has so cut into prices for steam boilers that boiler makers have prevailed upon plate makers to roll out very inferior stock for them to secure it at a low price. The plate makers now propose to agree among themselves not to produce this dangerous material, and the *Iron Age* heartily approves the proposition. It is impossible, says our exchange, to say what action will be taken by the meeting, but all manufacturers of good brands are interested in keeping up a high standard. This is fully understood and appreciated by the Inspector General, who evidently desires to work to the same end so far as the provisions of the law under which he acts, will allow. The present law, however, is considered very defective in fixing the ultimate strength of boiler plate as the standard of quality. It is well known that a hard, brittle iron will sometimes show a tensile strength as high as that of a more ductile plate, and sometimes much higher. Among the greatest strains to which boilers are subjected are those which result from the expansion and contraction of the iron, and a soft, tough plate will best stand this class of strains under ordinary conditions. If buyers of boiler plates wanted only those of good quality, and were willing to pay what they are fairly worth, it would be a matter of small consequence what the law provided. Unfortunately, in times like these of sharp competition, cheapness becomes a consideration of prime importance, even with steam users. A meeting of the trade cannot fail to be productive of good results in calling public attention to the fact that the law gives no guaranty of security for steam users against the consequences of using inferior material or accepting cheap and second-rate workmanship in boilers.

THE METALLIC SLEEPER PROBLEM.—Many railroads, the Central Pacific among them, has tried experiments to test the efficacy of iron sleepers in the hope to cut off the expense of perishable timber. The same problem is being worked at in Europe. It is stated that M. de Soignie, a Belgian engineer, and formerly a forge master, has patented a system of rail and longitudinal sleeper in steel, rolled all in one piece, and that the John Cockerill Company are now rolling an experimental couple-of-thousand pieces, to be laid near Ghent, between Quatrecht and Melle. The compound rail and sleeper is 12 meters long by 300 millimeters broad, and weigh 51 kilometers the meter run. If adopted, the Belgian iron and steel trades would benefit to the extent of 102 kilometers of steel, and 15 kilometers of iron for every meter of way laid with the new combination, and this, of course, is reason enough why it should be warmly recommended to the attention of the Belgian Minister of Public Works. All the advantages of the Hilf and De Serres and Battig sleeper, both of which are now being experimented with by the State, are combined and augmented in M. de Soignie's invention.

A BRIDGE MADE OF OLD RAILS.—A correspondent of the *Railroad Gazette* informs that journal that at the workshops of the Prince Edward's Island railway a bridge is being constructed from old iron rails. The plan of the bridge is a lattice girder, 31 feet span. The top chord is formed of three rails laid parallel; the bottom chord is formed in like manner, the lower rails being placed in an inverted position. The diagonal bracing is formed of short pieces of rails, bent at the upper and lower ends and twisted with a half turn in the middle, so as to cause the flanges to come in conjunction with the flanges of the top and bottom chords. The flanges are then riveted together with three-eighth-inch rivets. At each place where the braces and counters meet the chord a half-inch iron plate is introduced, which binds the three rails of the chord together. The rails used are 40-lb. iron of the Sandberg pattern. The bridge is designed by Mr. G. C. Cunningham, chief engineer of the road.

LARGE WHEELS FOR AFRICA.—A Philadelphia paper says that Messrs. Hoopes, Bro. & Darlington, spoke manufacturers, of West Chester, Pa., are now engaged in filling an extensive order for some of the largest wheels ever turned out from any establishment of the kind in the country. They are to shipped to Port Natal in the south of Africa, where they will be used for hauling goods to and from the interior of that country. Some idea can be formed of their size by their dimensions, which are as follows: The hind wheels are 5 feet high, spokes 3 inches, hub 12 by 14½ inches, and felloes 3 by 4½ inches. The front wheels are 3 feet 9 inches high, spokes 3 inches, hubs 11 by 14½ inches, felloes 3 by 4½ inches. The order calls for 64 sets or 256 wheels, but the firm found some difficulty in procuring a sufficient amount of timber of the right kind to complete the order.

LOCOMOTIVES FOR THE ELEVATED RAILWAY.—The *Railroad Gazette* gives the following dimensions of the four-wheeled locomotives built for the New York elevated railway: Cylinders, 10x14 in.; driving wheels, 38 in. diameter; distance from center to center of driving wheels, 6 ft.; length of fire-box, 5 ft. 6 in.; width of fire-box, 2 ft. 10½ in.; depth of fire-box, 2 ft. 8 in; diameter of boiler, 2 ft. 10 in.; 100 flues, 1½ in. diameter; hight of smoke-stack above rail, 10 ft. 10½ in.; weight of engine with boiler and tank filled, 23,740 lbs.

SCIENTIFIC PROGRESS.

Forests and Fungi.

Dr. H. W. Harkness, of Sacramento, is one of our most able and devoted mycologists. His studies have not only enriched the treasures of sciences in the branch he chooses, but they also have most important practical bearings. At the last meeting of the Academy of Sciences, Dr. Harkness presented an elaborate paper on "Fungoid Diseases in the trees of the Sierra Nevada." The writer began by describing the various fungoid diseases which affect vegetation, and instanced the *Peronospora* in the potato field, the *Erisyphe* in the wheat, the *Sphæria Morbosa* of the fruit trees, and the *Meruluis* and *Polyporus* among the trees of the forest, as all types of a large number of parasitic diseases that are silently converting our forest trees into their original elements. In many cases, he said, it is probable that the trees has attained its growth before it is attacked, but the external signs are so obscure that valuable trees are often lost, before the presence of the disease is suspected. A notable example of this is to be found in the Douglass spruce of our mountains, which is one of our most beautiful trees, while for many purposes the timber is of great value. The species of fungus known as the *Dædalia* causes the lumberman to suffer a great loss in these trees. The disease attacks the living trees in the form of a dry rot. Its presence is often not detected until much labor has been expended in preparing the lumber for market.

The fungus first finds lodgment beneath some dead limb. Following the course of the limb as it enters the heart wood of the tree, the mycelium begins immediately to branch upward and downward along the line of the longitudinal cells. Ramifying among these it saps the cell contents and destroys the vitality of the structure. On making a section of the trees the line of devastation may be easily traced by the minute channels filled with the decaying wood.

Dr. Harkness then reviewed the *Polyporus Revolutus*, which, he said, makes havoc with the fir tree of the Sierra. The fungus attaches itself to the bark of the tree; its mycelium soon penetrates to the cambium beneath; there it spreads over a considerable space, and begins to force its way directly through the sap-wood toward the heart. The tree, however, does not die soon, and it is only after years of contest that the fir fails prey to the destroyer. So general is the disease among the firs that few, if any, die from any other cause. In conclusion, he gave an extended account of the fungoid disease which attacks *Libocedrus Decurrens*, a tree of great value for timber, the consumption of which is constantly increasing as its good qualities are becoming better known.

THE ELECTRIC LIGHT AGITATION.—Many people are on the alert to see what is to come of the loud promises which were made on the part of Mr. Edison that he should soon puncture all the gasometers in the country. It seems evident that the announcement was made a little in advance of the accomplishment, but the inventor is in vigorous pursuit of his triumph. The latest news is that a company has been incorporated to be called the "Edison Electric Light Company." The capital is fixed at $300,000, with the right of increase. According to Eastern exchanges, the object of the company is stated generally to be "the production of heat, light and power by electricity." The present object, however, is to supply a fund which is to assist Mr. Edison in carrying forward his experiments to a point where he shall give a positive demonstration of the powers of his new inventions. Precisely what these inventions are in all their details of transmission of force and multiplication of the light derived from electricity, Mr. Edison has not yet told to anybody, fearing that the devices may be patented abroad. The invention as to the use of electric lights, it is said, will not include the use of carbon points as ordinarily known in electric lights, but instead the incandescence of a metal simpler and cheaper in every way. Mr. Edison has determined upon the general features of his light, its manner of production, etc., but in many minor points connected with the distribution of the light for ordinary domestic and business purposes much work is yet to be done. No date has been fixed for the public demonstration, nor will any be made until after the invention is patented here and abroad.

PRACTICAL RESULT OF AN ARCTIC EXPLORATION.—Wheat from a new source made its appearance in Europe this year, the Danish vessel *Neptune* having brought a cargo from the Obi river in Siberia, to Hamburg. The voyage from Hammerfest, in Norway, through the Arctic sea to the mouth of the Obi and return was made in five weeks, and without any serious difficulty. Siberia is a great country in extent and there are said to be almost limitless possibilities in the way of wheat raising on its vast steppes, but as long as the country is as thinly peopled, and as difficult of access as at present, our Western wheat growers will have little to fear from its competition. The voyage of the *Neptune* was suggested by recent explorations made in the Arctic sea.

UNITED STATES SURVEY OF THE AMAZON.—Capt. T. O. Selfridge, United States Navy, in command of the United States steamer *Enterprise*, recently returned from an important survey of the Amazon river. He is busily engaged upon his report, which will be presented to Congress in December by the Secretary of the Navy. The extensive maps, some 30 in number, will not be ready for the public for some months, owing to the large amount of work necessary to prepare them. The expedition to determine the navigability of the Amazon and Maderia rivers has proved eminently satisfactory. The 150 who went there from the Southern States, having but little capital and indifferent labor, have had a hard task in their warfare with wild nature in redeeming the soil from its dominion. Now, that they have accomplished this, they are doing better, and appear to be contented in the home of their adoption. The *Enterprise* was the first foreign naval ship that ever ascended the Amazon for any distance. The sole representative of American energy on the Amazon is a small colony of Southerners now settled at Santa Rem, some 500 miles from its mouth. There are about six families, who have remained to test the adaptability of the Brazilian soil for American enterprise.

THE TERRITORIAL SURVEYS.—Prof. Hayden and Major Powell have reported to the Secretary of the Interior the general results of their topographical and geological surveys during the past season. The former says: The results of the season's labor, though a short one, has been on the whole very satisfactory. About 12,000 square miles of very difficult country was surveyed—much of it in minute detail—and a mass of observations secured for the twelfth annual report, which will make it of more general interest and value, than any preceding. The Yellowstone Park and the Wind River range of mountains formed a part of the region covered by Hayden's Survey. The work under Major Powell has been prosecuted south and east of the Grand Canyon of the Colorado river. Little irrigable, but extensive grazing lands have been discovered. He reports having collected much ethnological material, and states that he has nearly completed a map showing the distribution of the various Indian tribes within our present boundaries, at dates when they were first known to Europeans.

THE NEED OF CORRECT STATE SURVEYS.—We read that Prof. J. Peter Lesley, at present State Geologist of Pennsylvania, and for some years engaged in conducting the elaborate geological survey of that State, breaks out into loud lamentations over the utterly inadequate delineations of the topography of the State on which he has to lit his geological charts. "They neither lit on to each other nor correspond to any common standard map," he says. County lines, he says, are sometimes half a mile away from their true places. The joint commission of the States of New York and Pennsylvania to establish the line between those States, has found the old accepted line wrong at every point so far as it has surveyed. The Coast Survey is now authorized to extend its system of triangulation over any State which provides for a scientific survey, and there never was a time when it was easier to get large corps of expert surveyors.

ACCELERATION OF NERVOUS VELOCITY BY THE WILL.—A translation in the *Journal of the Franklin Institute* says that Chauveau has lately undertaken two distinct sets of experiments. In the first, he compared the velocity of transmission in the nerves of the laryngeal muscles (red voluntary muscles), and in those of the cervical position of the œsophagus (red involuntary muscles). In the second, the comparison was extended to the nerves of the terminal portion of the œsophagus (pale involuntary muscles). He finds that in the motor nerves of the red involuntary muscles, the velocity of transmission of centrifugal excitement is about eight times less than in the nerves of muscles which have an identical structure, but which belong to the portion of the muscular system that is controlled by the will.

WINE TESTING IN PARIS.—The *Journal Officiel* states that the French Minister of Commerce and Agriculture has directed the Agronomic Institute to undertake the chemical analysis of every description of wine at present on view at the Paris exhibition. More than 10,000 varieties of French, Spanish, Italian, Austro-Hungarian, American and African wines are to be examined. This gigantic task has been entrusted to M. Boussingault, director of the laboratories attached to the Institute, who will be assisted in his labors by M. Josef Boussingault, his son. The analysis will be carried out at the laboratory built by the Institute at the dairy connected with the Vincennes farm.

MICROSCOPY.—Upon the whole the initial number of the *American Quarterly Microscopical Journal*, which is just issued, is a credit to the progress of microscopical research in this country. There is rarely a copy of a new journal which shows so many excellences and so few faults. The *Journal* is illustrated by six full-sized plates on stone, illustrating the essays presented, and an exquisite steel plate of new diatoms, described by Prof. H. L. Smith. The *Journal* should receive the encouragement of all microscopists and literateurs. The editor is Prof. Romyn Hitchcock, 150 Nassau street, New York.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

VOLCANO.—*Ledger:* The Harmon boys, who own a recently-discovered quartz ledge near Mace's mill, had a clean-up lately, which yielded at the rate of $75 per ton. Something like ten tons were passed through the mill. The Rising Sun mine is located back of Aqueduct, towards the Mokelumne river. Within the last few days a valuable body of quartz has been struck.

MARBLE QUARRY.—Five saws are running at present by steam. In a few weeks work will be suspended for a season, so as to fit up to run by water power, also to put in new saws, and do needed repairs. Six men are employed. The marble is very hard, but considered of fair quality. It is expected that the marble will improve in quality when the quarry is developed 10 or 12 feet deeper. The works are located on the north fork of Dry creek, down in a deep hollow, surrounded by high hills. The quarry is owned by Tubbs & Collins, Oakland.

PIONEER DISTRICT.—*Dispatch*, Nov. 23: The Groesbach mine has upon its dump about 90 tons of good ore ready for crushing. Recently a very rich strike has been made in this mine, and the rock now being taken out shows large quantities of free gold and sulphurets. The Wildcat mine, owned by McQuade & Toop, is still being worked, with the most flattering prospects. They have several tons of rock upon the dump, which look much better than the last they had crushed, that paying the handsome little sum of $30 per ton. Joe Le Duc has about 30 tons of rock out at his claim, near Ledford's ranch, on the Antelope toll road, which shows largely of free gold and sulphurets. Dick Stoken, better known as Lucky Dick, has recently discovered a remarkably rich lead on Pioneer creek, just south of the Groesbach mine. The Modoc mine is being worked by Mr. Jack McNamara, the rock of which is now being crushed at Mace's mill.

MONTERICHARD.—This thriving little mine, at its last clean-up, the first of the month, produced a result about $800 in advance of any former clean-up—the rock averaging between $9 and $10 per ton. The shaft is being sunk another 100 feet, 35 feet of which has been attained; making the mine now about 295 feet in depth. The lead at the bottom is somewhat wider than above, and the rock appears to continue improving in quality as well as quantity.

HOISTING-WORKS COMPLETED.—The steam hoisting-works for the Moore mine has been completed. The workmen are now engaged in putting up a mill just below the hoisting-works, which will be run by water power.

CALAVERAS.

ITEMS.—Mr. Jas. Duryea, proprietor of the well-known claim in Chile gulch that bears his name, is about to resume hydraulicing. Several Celestials have purchased the lot owned by P. Moro, situated in San Andreas gulch, for the purpose of mining the same. It is said that good rock is again being taken from the well-known Blue Jay mine, at Mosquito.

EL DORADO.

KELSEY.—*Mountain Democrat*, Nov. 23: In the Gold Deposit, the shaft has been sunk 10 feet since last accounts, and the ore still improves as the sinking progresses. It shows a larger percentage of sulphurets, which give the most flattering results. The arastra was cleaned up last week and gave a return that astonished those who saw the ore before it was reduced. The mill is now completed and in operation. Its capacity will be about 20 tons in 24 hours. A sale for the sulphuret furnace is now being graded, and the building of it will soon commence. The material to be used is the "rock soap" of Alderman & Co. This material is proving to be a great success for a variety of purposes, one of which is fire walls. It is easily handled, and, so far as it has been tested, appears to be fire-proof. Therefore the Superintendent has decided to build the furnace of it. The success of the Gold Deposit has caused considerable stir in mining circles here and elsewhere, and parties are coming and examining our mines almost every day, with a view to buying and working them for legitimate results. The first north extension of the Gold Deposit has been bought by a San Francisco company, and they will commence operations immediately.

PLACERVILLE GOLD QUARTZ CO.—The work of sinking the shaft to the 400 level is progressing rapidly. The shaft now out of the vein in the softer material of the foot-wall at a depth of about 360 feet. The winze in the north drift of the 300 level is keeping pace with the shaft. A large quantity of high grade ore has been taken out and is stored in the drifts, to be raised when the work on the shaft is completed.

GRAND MINING ENTERPRISE.—Mr. Mendenhall, of Livermore, one of the pioneers who came to California before the discovery of gold, and who is associated with Thomas Stapleton in the gravel hill mine at Diamond Springs, has been making arrangements for hydraulicing that large tract of gravel. Large pipes are to convey the water from Hangtown hill just south of Placerville, across Weber creek, a distance of over 6,000 feet, to the mine in question. This will give a tremendous pressure, and as the hill is free from the lava capping there is a comparative certainty that it can be hydrauliced very profitably.

INYO.

SNOW'S CANYON.—*Independent*, Nov. 16: A bullion shipment of $1,300 has been made by Messrs. Grove & Mitchell, the proceeds of five tons of ore from their mine in Snow's canyon, a silver brick weighing 22 pounds valued at $500, and a gold bar weighing four pounds worth about $800. This is one of many small shipments from the five-stamp mill at that point, which has just concluded a two months' run. The works were started up in the spirit of experiment, to thoroughly test the ores from the many mines in that vicinity. The results have been very satisfactory. Some of the most promising mines have now men at work, and ere long when some little improvements are made in the mill and ore accumulates operations will again be resumed there.

KEARSARGE IMPROVING.—The developments in both of the Kearsarge tunnels grow more and more encouraging. In the main ledge at the heading of the long tunnel, Supt. Gray is now finding ore, specimens of which assay into the thousands. The plan now is to suspend crosscutting and run straight to the vertical line of the shaft (a distance of 80 feet), then by an up-raise of 140 feet to make the connection therewith. The Whitney tunnel is in 60 feet, at which point the ledge had increased to five feet in width, about one-third of which was ore that would easily go $150 a ton. As stated heretofore, it is only a question of distance (perhaps 300 feet) when this ledge will merge into the Kearsarge proper. In view of these favorable facts, there is a probability that work on the proposed deep tunnel, starting near the mill, will be commenced before spring; in any event the other two will be driven straight along all winter. The mill will not likely be started up before spring, although there is already quite a pile of good ore on the respective dumps.

ITEMS.—The new Lee district water-works are reported a complete success. Prospects are reported favorable in the Brown Monster or Old Eclipse mine.

MARIPOSA.

FERGUSON MINE.—*Gazette*, Nov. 23: The Ferguson mine, which is situated on the northern bank of the Merced river, has resumed operations and is again in full blast. It will be remembered that some ten years since this mine was yielding a large amount of gold, and gave employment to a large number of men, and made remunerative returns to its owners. But ill fate for a time was against it. The history of the mine from that time to the present is pretty well known to the people here, and would be of little interest to the general reader. The present prospects of this mine are perhaps better than ever before. The company have erected a new stamp mill, which is run by an overshot wheel, calculated to have sufficient power to run 20 stamps, if more at any time should be desired. The work, principally, is in the No. 2 shaft, which is sunk 200 feet below the tunnel, on the vein, which varies in width from 3 to 7 feet, from the first station to the second, and will pay from $10 to $25 per ton. The stopes above the first station look exceedingly well, and pay from $15 to $40 per ton. There is sufficient rock in sight at this level to run the mill for two years, as the pay chute is 500 feet long. By the 1st of December, drifting and stoping at No. 2 level will commence, where there is an abundance of rock in sight that looks well. This mine is now owned by Messrs. Ferguson & Leachman, and superintended by Robert Francis.

VIROIN HILL MINE.—This mine, owned by Opie & Blair, has just cleaned up, and from 21 tons of rock they realized 33 ounces of gold, which is pretty good for top rock. It was taken out of the first 25 feet from the surface in sinking the shaft on the vein, which varies from 1 to 3 feet in width, and is in slate formation. This company have a good vein in the same neighborhood, called the "Victoria," from which they now have 50 tons of ore on the dump ready for crushing, which will pay from $15 to $20 per ton. The ledge is about 2 feet wide, and is also in slate formation.

ASTRO VEIN.—This vein, owned by Henwood & Stewart, was recently discovered; it shows a vein 8 inches wide at the top and 2 feet at the bottom of the new shaft, 12 feet deep. The rock shows well in gold and sulphurets. The owners intend soon to put up a 12-foot arastra to run by water power. They have a mill site and water privilege, that can be used for milling purposes, convenient to the mine.

MONO.

SOUTH STANDARD.—Bodie *Standard*, Nov. 20: Making fair progress sinking main shaft; since last report have sunk 20 feet. Are now 350 feet deep. Will commence timbering up from the bottom to-day to meet timbers 50 feet above, which will take two or three days, after which will continue shaft down. The formation is very regular, and indications good as greater depth is attained.

QUEEN BEE.—Engine and boiler in place and hoisting hy steam commenced. Engaged squaring up and cribbing the shaft, which will be completed this week. As soon as sinking is resumed 100 feet more depth will be attained, when ore will be again extracted.

ORIENT.—Shaft now down 100 feet. In the east crosscut at that level have struck a vein formation rock which assays $27 per ton in gold.

BULWER.—The station in the South Standard shaft is now completed, and the guides are being placed in the shaft. The work being done is principally cleaning the drifts and laying track. It is expected to be ready to hoist ore about the 25th inst.

A NEW STRIKE.—The indefatigable prospector, Rodger Homer, while walking over the west side of Bodie bluff was tempted to explore a piece of ground which he thought contained mineral. A few blows of the pick revealed to his astonished vision a vein of white quartz enclosing pieces of almost solid gold. The quartz was about eight inches in width and nearly three inches of it gold. Assays made from this remarkable find gave the result of $41,684.50 in gold, with $1,570 in silver.

OTHER BODIE MINES.—About 18 feet from the main shaft of the Standard the east crosscut 334 feet from the surface struck a two-foot ledge of fair ore. The ledge in the upraise from the 300 level is in a three-foot ledge of good ore. October shipments from this mine amounted to $87,401.02. The Bodie ledges are looking well. Regular shipments continue. For October they amounted to $123,645.06. The stopes in Pacific No. 2, of the Con. Pacific, are yielding rather more than the usual quantity of rich ore, which is working easier. The west crosscuts from the north and south drifts on the 250 level of the Red Cloud Con. are expected to cut the Packard & Morton in about two weeks. The Blackhawk has struck a favorable quartz stratum. Summit has two fair ledges. No particular changes in South Bodie. Everything in the Spaulding is in good working order. It is reported that improved hoisting works will soon be placed on the ground of the Enterprise. The shaft is down 90 feet. Everything well in the Mono & Cross. Prospects of an immense fissure in Riqueza. A big vein expected soon in Bodie Tunnel. Rustler shaft down 180 feet and still going. Ominous stringers of quartz in the Glen Dale Con. shaft. Indications point to an early strike in the Goodshaw. Two feeders of ore have been lately cut in the Syndicate. The California shaft is down 133 feet. Work resumed. The Dudley shaft is in good sinking ground at a depth of 208 feet. Will shortly commence extracting ore from the Charter Oak. East crosscut of White Cloud advancing rapidly as possible. No changes.

FRENCH M. DISTRICT.—*Standard*, Nov. 20: A new district named the French mining district has been formed in this county. The mines are situated about 25 miles from Bishop Creek, and the same distance from Lake district. They were discovered in September last and work commenced upon them. Among the locations made are the J. H. L., Leonia, Oakland, Lyon, Verlague, Charlotte, C. C. Shaft and Morning Star. The owners are August Dussene, Eugene King, Jules Gadwelle, Pierce Thabard, Charles Mayson, Antoine Verleguet, Dennis V. Bertrand, Jackson Shipply, Charles Worthley and Christ Heldebrand. Rich assays are said to have been obtained from the ore extracted and the result of the workings thus far have been eminently satisfactory. Winter will probably retard the working and the locators must consequently await the opening of spring before much work can be done.

NEVADA.

ITEMS.—It is reported that gravel that will go $3 per carload has been struck in the Watt mine. Lafayette, No. 2, a mine now being worked on Osborn hill, is said to show good rock, and the company is about to incorporate. The frame of the new mill for the Scadden Flat mine is up and will soon be enclosed. In due time the machinery will be in place and running. The Derbec made lately a $2,500 clean-up. The Mammoth Blue Gravel M. Co. have leased their claim, on the road between Bear valley and Scott's Flat, to D. Wellington & Co. five years. A recent clean-up from 18 loads of Ford, McDonald & Mullen's claim, New York hill, yielded $100 per load. The claim is now worked to a depth of 100 feet, and the ledge is showing a width of 12 inches. The crushings from this ledge have been uniformly rich. Marks Zellerbach has received a patent for mining claims in the Columbia hill district, which include 526 77.100 acres. Nine loads from the Centennial have yielded at the rate of $154 per load. Wm. B. Fowler has been appointed foreman of the Planet gravel mine. Messrs. Ragan & Jamieson, who have a two-foot ledge on Water street, Nevada City, are taking out some good looking rock. Among other enterprises owing the encouragement if not their existence to the success in the Derbec is the Mount Blanc mine.

WASHINGTON NOTES.—*Herald*, Nov. 19: The Yuba mine prospects look favorable. The ledge, which for a time last summer appeared to be lost, has been again found. It is three feet thick and looks well. Only eight men are at present employed in the mine, and it is being thoroughly prospected by tunnels. Scotchman Creek mine will start up in a day or two, arrangements having been made for water. Mr. E. Bond is pushing ahead the work at Alpha, getting the flumes and ditches made and the mine fitted up so as to be ready to take advantage of the water season. Washing has commenced at Omega, the late storm having furnished sufficient water to make a run with.

PLACER.

HYDRAULICING IN THE HIGHER HILLS.—*Herald*, Nov. 23: Commencing at the southeast side of the north fork of the American river, between the mouths of Indian and Shirt Tail canyons, Mr. DeKruse, of Wisconsin Hill district, is opening extensive bar and bank diggings. Coming up Indian canyon, the first claim in the bed of the stream is owned by Mr. Stone, of the Toll-bridge, and three partners. It is two miles in length. The second claim is owned by Mr. H. Stemple, of Iowa Hill, and it is one and a half miles in length. The third claim is owned by Messrs. Coleman Brothers, of Grass Valley, and it is nearly three miles in length. Mr. Simonds, of Dutch Flat, is the superintendent. The claim extends up to the wire suspension foot-bridge, across Indian canyon. The fourth claim is owned by Mr. J. Burns & Company, and is one mile in length. The fifth claim, of a little less than one mile, is held by Mr. Echmidt & Company. Stone's claim has been leased to a company of Chinamen, for the present season. Mr. Stemple has done an immense amount of work. He has constructed a bedrock tunnel, of 150 feet. He has also laid down a plank-flume, eight feet wide and three feet high, of 700 feet. He has probably expended $10,000. The third, or Indian Canyon claim, was formerly owned by a Mr. Bumpus, who cleaned up a fortune in gold. Messrs. Coleman Brothers have laid down 1,200 feet of bedrock flume, which is 10 feet wide and 7 feet high. They have used nearly 120,000 feet of lumber, which was sawed at the Sugar Pine mill, and at the Mt. Pleasant mill, of Messrs. Spencer & Company. The expense of fitting up this claim has not been far from $12,000. This is decidedly the most valuable of all the claims in Indian canyon. There is a deposit of tailings, to be run off towards the North Fork, of from 20 to 30 feet deep, extending a distance of over two miles. Going up on the southeast or left bank of Indian canyon, the claims are located as follows: the DeKruse claim, owned now by Mrs. Hill and her agents; the Kidder claim; the Morning Star, or the Coleman & Company's claim; the Swiss Boys' claim; G. Jones' claim; Austin Brothers' claim; Judge Spear's claim; and two or three others not remembered. Coming down on the northwest or right bank, the following is the order: P. Stone's claim; W. Davis' claim; J. Mills' claim; Mr. Barbor's claim; Mr. Entwistle's claim; Mr. Hobson & Company's claim; Chinaman's claim; the Seven Points, or J. Mitchell's claim; the North Star, or Weisler, Bird & Company's claim; and lastly, the Oregon, which is owned by Messrs. O. J. and E. G. Spencer, of Mount Pleasant mill, C. F. Macy, of Iowa Hill, and Hill, Conklin & Ladd, of San Francisco. The Morning Star Company has a mining patent for 165 acres; P. Sloan, for 41 acres; and the Orion Company, for 100 acres. It is said that Mr. Hobson has 50 acres in his claim; but he and all others, excepting the three companies mentioned, hold only a possessory right to their claims; hence they must expend one hundred dollars worth of work each year, or lose their title.

SAN BERNARDINO.

SILVERADO EXTENDED.—Colton *Semi-Tropic*, Nov. 23: A party of prospectors have discovered some very rich silver deposits in the Santa Ana range of mountains, some 30 miles south of here. The ledge is a continuation of the Silverado deposits, and the locations are in plain sight from here. The ledge is reported as turning out very rich, and they are jubilant at their success. The same parties report finding a ledge of tin ore about sixty miles north of here, and very nearly on the line of the proposed cut-off from here to Mohave. This ore assays very rich, many specimens going over 40% tin, and the ledge is reported to be 40 feet in width. These, with other finds over the county, indicate that prospectors have yet a large field over which to exercise their skill. Many square miles of our county have never yet been pressed by the foot of the white man, and there remains many a rich mine undiscovered, which will, when found, put ducats into the pockets of the lucky prospector. Fuel is low in price and water abundant and of exceptional purity, and can be had at a nominal cost.

SAN LUIS OBISPO.

CHROME AGAIN.—*South Coast*, Nov. 22: A fine specimen of chrome has been laid on our table by G. W. Hampton, Esq., which was taken from a claim recently located and now being worked by him. Mr. J. L. Kester has made some recent discoveries of chrome which promise to be both rich and extensive. The London Chrome Co. have run a tunnel about 125 feet into their mine, which prospects so well that the company feel encouraged to go on. Several other parties are now opening new mines, and so far as we can learn, the prospects of all are good. The chrome interests of this county are really becoming a matter of importance, not only to the owners of mines but to the shippers and consumers of the mineral.

SHASTA.

WHISKYTOWN DISTRICT.—Reading *Independent*, Nov. 20: Bell, Woodward & Knox have struck their ledge 200 feet below where they have already worked it, and from which they have taken many thousand dollars. The ledge where they have tapped it by a tunnel exhibits the same quality of rock as that taken out nearer the surface. This is without a doubt one of the best paying mine in the Whiskytown district.

IGO.—*Independent:* J. B. Batcheller informs us that the Hardscrabble mine, under the superintendence of R. G. Harvey, has made several satisfactory clean-ups this season, and that they have plenty of water to keep several little giants running. He also reports an unusual amount of activity among the miners of the district, and predicts a prosperous mining season.

COPPER CITY.—*Independent:* At the Extra Co.'s mine work is going on at the usual lively

Continued on page 348

Mines and Works of Almaden.—No. II

[Translated for the PRESS from "ANNALES DES MINES."]

The price per cubic meter of masonry may be estimated in the following manner:

First—Arches.	francs.
Bricks	20.00
Lime	2.50
Transportation	2.50 to 5.00
Mason work	9.00
	34.00 to 36.00

Second—Massive Masonry.	francs.
Stone	6.00
Transportation	3.00 to 5.50
Lime and sand	2.50
Mason work	7.00
	18.50 to 21.00

Here are also, on the subject of the work of stoping and sustaining, some precise figures taken from the official register of the administration of the mines:

From July 1st, 1875 to July 1st, 1876: First—Stoping, number of stopes on the average, 120; volume stoped, 6,680 cubic meters. Expenses—Stoping, 292,615 francs; repairing of tools, 17,250 francs; total, 309,865 francs. Number of day's work paid for, 54,747.

The total number of cubic meters of rock stoped has been:

In ore	6,367.850
In sterile rock	371.507
Total	6,730.357

From this it results that it has cost, on an average, 46 francs per cubic meter.

The production has been as follows:

	Tons.
In ore	19,498.489
In sterile rock	1,590.446
Total	21,088.035

Of the 6,367.85 cubic meters of ore stoped in the mine, 4,312.071 cubic meters came from the reserves, which regularly should not furnish but one-third of the total production; they represent, from what we have said, the third of the entire deposit. It is only that they have for a long time allowed these reserves to accumulate, and that they have properly decided to reduce them to a less exaggerated amount, by removing a considerable part of them in the last two years. Also the ton of ore has not cost so much this year, for stoping, only 15.90 francs; while the stoping has cost 25.90 francs, 23.70 francs, 26.50 francs, 23.80 francs, 18.40 francs for the five preceding years. These figures justify what we have previously said upon the removal of the reserves.

Second, Supporting.—In figures at all precise I am here deficient. Much the more so, because the accounts of the mine are not kept distinct for the timbering, and the masonry, and also because the accounts for the year terminating July 1st, 1876, were not yet completely drawn up at the time of my visit to Almaden.

The expenses of sustaining vary from 200,000 to 250,000 francs per year; they were for 1875-76 in the neighborhood of 230,000 francs. Or we may calculate for the year—for laying—504.924 cubic meters, of arches, cost, 4,476.53 francs; and 2,687.199 cubic meters, of stone work, cost 18,328.68 francs. We have just seen that the price of the cubic meter of masonry for the arches can be estimated at 35 francs, and that of the cubic meter of the massive stone work at 20 francs.

The masonry work should not, therefore, cost but about 72,000 francs, and the remainder, more than 150,000 francs, should be devoted to the work of timbering and to repairs. This figure explains itself when one recalls the number of timber men (120 men) constantly occupied, and the high price of wood (75 francs per cubic meter) for supporting.

We now pass to the study of the means of transport and of extraction.

Tramming.—All the work of interior transportation, whether of ore to the shafts, or of material to the foot of the workmen, or of tools back and forth from their depositories, come under this head. For tramming, rectangular wagons of iron, holding 216 liters, (a liter is about a quart), containing a weight of 400 kilogrammes of ore. They move over the tracks of iron placed 0.78 meters apart, formed of rails which weigh 10 kilogrammes per running meter. The work designated as service of extraction and of introduction, comprises all the interior movements; it is paid for at the rate of 0.25 to 0.32 francs per 100 kilog. of weight extracted or introduced, except for the materials for construction, for these, indeed, the administration pays by the cubic meter of masonry in place; the price varies according to the position of the works, it is on the average 2.50 francs for the vein San Pedro y San Diego, and 5 francs for San Francisco and San Nicholas.

Hoisting.—The extraction to the surface is made in the same wagons, which are raised in cages guided by strong oak beams of Canada oak, and suspended by flat cables in strands.

Until 1873 the hoisting was done only in the San Teodoro shaft, by means of horses or mules. Since the month of March, 1873, the work of hoisting and lowering has been also carried on by the shaft of San Miguel. Near the mouth of this shaft is placed a steam engine of a nominal force of 20-horse power, with a horizontal cylinder, with condensation and variable expansion of the system of Meyer; the two reels upon which are rolled the cables are put in movement by this machine, by the intervention of a gearing of cog-wheels. The velocity of the cables is about 2 meters per second. The engine also put in motion one of Guibal's ventilators, which draws off the vitiated air from the mine.

Until the introduction of this steam engine, the shaft of San Miguel had never served but for the descent of men; but they were obliged in 1874 to interrupt the hoisting from San Teodoro, in order to regulate the walls of the shaft and to introduce a system of guides; these operations have been finished, as also is the erection of the hoisting engine, but the provisional arrangement at San Miguel having given good results was retained.

The engine at the San Teodoro shaft has a nominal power of 40 horses; it consists of two vertical cylinders with condensation and variable expansion of the Audhemar system; the admission and the discharge of steam is accomplished by valves; it was constructed in the shops of John Cockrill, at Seraing. A small auxillary machine of six-horse power is arranged to come to its aid in case of necessity. Its power is calculated in such a manner as to be able to effect in 12 hours the normal hoisting and drainage of the mine, by means of water tanks.

At the San Aquilino shaft is placed an engine of 30-horse power with a vertical cylinder, with condensation, and Guinottes apparatus for variable expansion. Its use is essentially the raising and lowering of workmen, who, entering the mine by a drift on the first level, at 44 meters below the surface, descend from the first level as far as they wish to go. One avoids thus on the one hand some work for the machine, and on the other the necessity on the part of the workmen who live lower than the shaft San Aquilino of climbing up there every day. Besides this work the engine serves also for extraction.

The mines of Almaden are then actually served in a manner entirely satisfactory by steam engines of the most perfected types, while four years ago their installation was regarded, with reason, as one of the most defective that could be seen even in Spain. This situation was the less comprehensible, as the mines of Almaden have given for a long time considerable benefits; it is only explicable by the carelessness of the Spanish government, its systematic defiance with regard to the engineers, and by the innumerable difficulties which gave rise to an excessive division of powers, particularly by the absolute separation of the technical direction and that of the administrative service. To remedy this state of things was required all the energy of M. Mouasterio, Inspector General of Mines, who was obliged continually to strive against the inertia of the government and against the ill wishes of the workmen of Almaden, who made, to the introduction of machines, the same irrational opposition that is made to almost all improvements, however rational they may be.

It may be asked why have they established engines of these different types. The principal reason has been the desire to make comparative trials, and to furnish to young mining engineers, for whom a sojourn at Almaden is a sort of applied school, the opportunity of seeing intimately and in their different details, different systems working concurrently.

Drainage.—The work of drainage divides itself into two parts: 1st, the elevation of the waters from the 7th level, that is to say, from 208 meters in depth; 2d, the elevation of the water from the 8th, 9th and 10th levels as far as the 7th.

The first of these services is accomplished at present almost exclusively by means of tanks of water, by the steam engine of San Teodoro shaft. Although they still work nearly four times a year a single acting steam engine of Watt, established in 1791, this engine is one of the first of these constructed by Watt, employing the movement of the working beam to open and close its valves, and to effect the condensation. The working beam of wood has only been consolidated later by the addition of some bars of iron. This machine puts in motion a column of seven suction lifting pumps, whose pistons, also of wood, are not one of the least peculiarities of this installation, which only conserve for it the title of a historic monument.

Two reservoirs, the one of 1,380 cubic meters no the 5th level, the other of 914 cubic meters on the 7th, serve to collect the waters of the mine.

The production of steam for this steam engine is effected by means of boilers heated by wood; for the services of stoking is paid at about 1.50 francs for lowering the level of the water in these reservoirs, or about 5 cubic meters of water extracted.

The water below the 7th level is raised by means of very large simple hand pumps, disposed in columns, and worked by men who receive for this work from 1.50 to 2 francs per day of 6 hours. It is to this service to which the slaves were formerly condemned in the mine.

It is now maintained by adjudication, paying to the contractor from 12 to 14 francs per centimeter of water lowered in the lower reservoir.

It is evident that the source of drainage still leaves much to be desired; this comes no doubt from their relatively smaller importance; the mine does not produce in fact, according to the observations of several years, but 72 to 84 cubic meters of water in 24 hours, of which a notable part comes from above the 7th level. For this part the expense has diminished since the installation of the engine of the San Teodoro in a remarkable proportion. It does not cost but little, in effect only 5,000 francs, in place of 40,000 which it formerly cost.

The price of extraction of the same has also descended, owing to the vein improvements, from 3.20 francs to 1.90 francs per ton.

Ventilation.—The ventilation of the mine is affected naturally, in consequence of the difference of level of the mouths of the shafts, which communicate with each other. The fresh air enters by San Teodoro and by San Aquiliuo, and escapes by San Miguel, after having traversed the works. In the hot season the current tends to be reversed, and it is prevented by means of a ventilator at San Miguel. Before the establishing of this apparatus, the ventilation was accelerated in summer by a fire at the base of the shaft.

The active renewals of the air is nowhere more necessary than at Almaden. It is charged with mercurial vapors and with miasma from the decomposition of wood. Very few of the old workmen, and above all, of the overseers, have escaped the mercurial trembling.

Shops.—The shafts of San Aquilino and San Teodoro, placed at the western extremity of the town of Almaden, less important than that of San Miguel, which is in the town itself, are covered with solid constructions which shelter the engines, and surrounded by a certain number of sheds which serve for shops and magazines. There are found there a forge and a carpenter shop, a shop for repairs. The two first serve to put in condition the tools used in the regular works; the third for the manufacture and repair of material for tramming. Here are found the principal machine tools, worked by a small steam engine of 12 horse-power. In these shops can be manufactured the tools which are used, but they prefer, nevertheless, to buy them; the repairing of a notable part of these tools is also done by contract.

All the service of the warehouses, the reception and the giving out of goods is done by children, who receive 0.40 francs to 0.85 francs per day, and by two old workmen whose health has been ruined by service in the mines to such a point that their labor is far from meriting the moderate salary, which is given them more as a pension than as remuneration for services rendered. It is also to these invalid workmen who are confided the work of exterior repairs, the keeping up of roads, etc., when they demand care to be kept in order.

All this work upon the surface employs about 650 men and 220 children; they are paid under the head of general expense of exploitation.

How They Salted that Mine.

[Written for the PRESS by G. R. E.]

This is the way he tells it: In the fall of 1873 I was prospecting around in Utah. One day when I was riding along on my animal, looking for a new prospect, I saw an eight-mule team hitched onto a load of cement barrels. "What are you doing with cement in this region," said I to the driver. But he was not inclined to be communicative. My curiosity was roused, I am something of an inventor myself, and I thought I would follow the wagon and see what new use they were putting so much cement to in a mining country. I camped after the team for a couple of days until I saw it drive up to a shaft. There was a shed over the shaft and under it a windlass. Near the shaft was stacked up about 150 sacks of ore. I picked up two or three specimens. It was chloride ore. One of the specimens assayed $250. I have the other specimens yet.

"Are you going to build a mill?" I asked the men at the shaft. But they were as uncommunicative as the teamster, and made me know that my absence would be about as pleasant as any advice I could give them. So I went off on my animal and prospected around in the neighborhood. I passed by the hoisting works several times. I saw that they had built a close shed near the shaft. I noticed that the cement and ore had disappeared. Not an ore sack, not a stave, nor a hoop, nor a barrel head was to be seen. But the miners were no more sociable than at first. I was not welcome there, so I wandered about awhile and then went back to Salt Lake.

After I had been in Salt Lake a few weeks, there came to the city an old "capitalist," whom I had known for years in San Francisco. He remained there five or six weeks and I saw him frequently. He looked half tickled and half worried. I knew he had something "big" on his mind. Sure enough. He knew I was a prospector and something of a judge of rock. So one day he asked me if I would go out into the country with him for a few days and look at a mine which he thought of buying. "Where is the mine? You have not paid for it?" said I.

"No," said he, "I have given them $2,000 and I am again going out to look at it before signing the papers. They are going to get $250,000."

"Well," said I, "I will go and be of service to you if I can."

Well, we went to the mine. It was the old shaft where I had seen the cement barrels hauled. The men did not know me. I had my city clothes on and I was shaved clean. They had a square shaft 37 feet deep. We went down it. From the top down to where they struck the ledge, there were little stringers of ore. At 30 feet down a wedge-shaped vein came in. Where they first struck it, it was about six inches wide, but it widened out as they went down, and where it crossed the bottom of the shaft, it was three and one-half feet across. It was a true fissure vein. The walls were smooth and hard country rock. It assayed from $75 to $80 a ton. On the whole it had the appearance of a first-rate ledge.

"Well, what do you think of it?" said the old gentleman. "Do you think this is the same ore as those specimens I showed you? I've had an expert here before and he says it is, and thinks the mine is a big thing."

"Well," said I (we were off to one side when we had this talk), "you've given them $2,000 since we've been here. That makes $4,000. Before you give them any more, just get a permit for me to put a few shots into the vein."

He asked the men, and they were glad to do anything to prove the richness of their claim. So I went to work in the bottom. The men wouldn't help me. The old gentleman was too nice and weak; so I had to work with a single hand-drill. I blew out some of the side of the vein and some of the bottom. I found nothing but vein matter. The men were mighty happy, and wanted to know if we were not satisfied. "Wait till I put in a few more shots," said I. "Do you want to spoil the whole mine," said they. "Spoil the mine," said I; "you have never seen better work than that," said I; "I know something about mining." So I blew out a little more of the side and bottom.

When I was ready I called the old man and we "consulted." "Let us get away from this country," I said to him. "Don't you pay a cent for the mine; it's salted."

"Look here," said he, "you're playing me; you want to get some of your friends to buy it."

"Come down with me," I said. We went down together. I pulled out the loose ore from the side and bottom, and showed him the country-rock where the vein ought to be—I had struck it about four feet below the bottom of the shaft. He thought we had better leave, too. But I told him to be careful, and not to let them know what we had found out. "They are regular mountain cut-throats. There's another of them that you haven't seen; he's shut up in that shed. He's the artist of the party; he made the mixture for the vein."

So we pitched the broken ore back into the holes, hitched up our animals, told the men to come in to Salt Lake and get their money, and started for town. The old gentleman did not pay $250,000 for that mine.

Well, a few days after they came to town for their pay. "Did you have the ore assayed?" they asked me. "No," said I; "but *he* did." "How did it go?" "Oh, it went just what you told him it would." "We're glad of that." "Look here," I said to them, confidentially, "if your game had succeeded you might have been lynched." "What do you mean?" said they. "What became of those cement barrels?" I asked. "Why didn't you pack that cement in sacks?" "Some people know a good deal, don't they?" said they. "Some people do," said I. "Some don't."

Shortly afterwards those men disappeared from Salt Lake.

The old gentleman gave me $3,000, and begged me never to tell anybody. Some twelve months after, when I passed the shaft, I found that all the pay ore had been cleaned out and carried away to some other unknown locality.

Silver Mill Wisdom.

From a little pamphlet by M.P. Ross, entitled "The Silver Mill," we take the following:

Amalgamation.

The modern amalgamating pan is a growth from the old arastra, and though quite simple of construction, has been the subject of a variety of forms. A better knowledge of what they can and should do, has narrowed those down to common generalities. The pan holds from one and one-half to two tons of pulp; the gearing underneath is open and plain; the muller is raised by a left-hand screw on top, the handwheels of which should be large; the jam wheel being no smaller than the screw wheel from the fact that at times it is the subject of even greater application of muscle than the latter. Again, when in fast motion it is decidedly inconvenient to adjust a small wheel under a larger one.

As the muller and driver are held to position by but one bearing, it is strange that the inclination has been to make this short. Eighteen inches is none too long for the bore of a driver, and the shaft should pass entirely through it when the castings are new, provision being made in the cap for the end of the shaft when the castings are worn.

Much time and labor are saved in babbitting the shaft, if it is made with a taper downward through the babbit; in which case, instead of withdrawing the shaft and cutting the old babbit, new babbit is poured with the old, the taper preventing displacement even if the new babbit becomes broken.

But the most important feature of a pan—one which may involve many dollars per day, but which often receives but little attention, and, though simple in principle, is very often not understood because not studied—is the pulp currents.

These currents must needs be uniform and regular to insure uniform work, and they must be strong enough at the bottom of the pan to carry the quicksilver. The motion of the muller makes a current by throwing the pulp to the outside as it advances, which then rolls up at the side and over to the center to be thrown out again. This, so far, cannot be improved upon, and the only service left for the wings is to add to the pan capacity by preventing the pulp from running too high up the sides, to accom-

plish which the best shapo is of an inverted ploughshare. Having very naturally a good current above the muller, we have only to work in unison with this underneath.

With the grooves between the shoes leading straight out, the current is impelled only by centrifugal force, which is insufficient to carry the quicksilver; but if the point of a shoe touches the diameter, its outer end being a very few inches either forward or back, a current is forced proportionate to the angle of departure from the given diameter. If the dovetails in the muller and pan bottom are relatively similar, to admit of the shoe and die being one and the same pattern, the currents of the two will be similar and in unison. When the currents are outward they coincide with that above the muller, inward currents being the reverse. A confusion of the two—unless one strongly overbalances the other—effects stagnation. It does not follow that because an inward current works contrawise to the one above the muller, that it cannot do good work; if it is strong they will compromise.

Definite rules for the angle of draft for shoes and dies cannot be laid down, because the speed of pan, the character and thickness of pulp, and, if grinding, the weight of muller, have each their influence.

It must rest with the millman to determine if the mechanical part of his amalgamation is perfect, or if his quicksilver is churned, or his castings cut out too quickly. A remedy is at hand, if systematically sought.

The speed of pans, a few years ago, was generally 60 or 65 revolutions per minute, 85 or 90 is more common now. With the slow motion the pulp should be thick, with the fast motion much thinner, and the charges of the latter are worked much sooner. A modern mill with fast batteries and fast pans accomplishes more than the slow one of old.

The screw on the settler driver should, unlike the pans, be right-handed, for besides being more convenient in case of a slipping belt, the power applied to turn the screw, helps the muller along.

Settlers are of two classes, one having mullers with wooden shoes, and the other having arms with either wooden or iron shoes or stirrers.

For heavy, unground sand, the muller is easier to start and less liable to clog, and is more commonly used in such cases, but for well ground sand the other style is superior.

A settler should never be allowed to foul by an accumulation of heavy matter at the bottom; it is a positive preventative of good work. It may seem easier to advocate this than always to follow it.

A seeming natural remedy for such a condition is really an aggravation to it, namely, a liberal use of water. There is a point in the thinning when the quicksilver will he precipitated, but the heavy sand held in suspension.

If, after the charge is run out, which should leave about eight inches in the settler, a pan is drawn and no water added for a half hour, the warm charge will gather and carry the sand; now enough water, only, is added to reduce it to an appearance of still some thickness, and this is all the water that is used in the charge. A horn spoon will show its success in advance of results.

Concentrations for a silver mill must necessarily he simple and capacious. Good agitators shoveled out often are profitable.

In some ores "sand sluices" are very effectual. A "sand sluice" for concentrating is a broad sluice 20 or 24 inches wide and in it, at intervals of eight or ten feet, are vertical strips at the sides to hold unfastened riffles. Thin riffles are laid in and the sand runs over them for a time, say one or more hours, when another conrse of riffles one-half inch, or less, thick, is laid on top of the others. This is repeated until the sluice is full, when it is shoveled out, meantime the sand should run through a duplicate sluice. These sluices should have a grade of about three and one-half inches to the rod, it is then under control; for by starting with a thin riffle at the bottom, a strong current may he had, whereas a thick riffle will give a deadened current.

These sluices are an advantage when blankets are profitable, and if followed by blankets relieves the lathes from much coarse, heavy material.

A blanket sluice should have a grade of about three inches in seven feet.

A Gift to Botanists.—The inheritor of the Villa Musset, near Cannes, has presented the building, together with the magnificent herbarium and library attached to it, and all the scientific instruments and appliances, to the French government, to he maintained as a place of study for botanists of all nations, free of cost. Persons desirous of studying there, whose applications are favorably entertained by the management, will be provided with free board and lodging in the institution for six weeks, and every opportunity afforded them to prosecute botanical research. In the case of applicants not provided with academical credentials, an introduction or letter of recommendation from some recognized *savant* will he required.

Introspection.—A chemist of Prague is said to have invented a form of mirror by the assistance of which the interior of wine or other casks can be thoroughly inspected without the necessity of removing their heads.

The East India government will keep an eye on war correspondents. Their plans are sometimes disturbed by enterprising newspaper men.

Useful Information.

Surplus Ships.

Those who have crossed the bay frequently during the last few months have noticed the large number of ships idly waiting for charters and have concluded that the ocean freighting business must be dull. Thus it is all over the world and the *Maritime Journal* quotes an extract from a speech of a Bristol, England, shipowner, which states facts and draws conclusions. He said: Last month more than 50,000 tons of shipping were lying idle in Bombay. In Calcutta, ships had been lying 12 months, during which time there had been from 80,000 to 100,000 tons disengaged and constantly pressing on the market, with freights averaging about one-half the paying rate. The China seas and the Straits are full of ships. In Australia, a friend has had a ship waiting for three months for a chance to load some. In San Francisco, there were in July 100,000 tons lying in port. The explanation of the present condition of the shipping trade is no new or intricate story. Free trade increased the volume of exchange in the world—in other words, the volume of the carrying trade of the world—so immensely in proportion to the then existing supply of shipping, that high profits were the rule for many years. Ship building was actively stimulated, and all the arts connected with it were energetically spurred on. The history of the building of iron ships is the history of a constant series of discoveries and inventions, involving a rapidly progressive facility of production, and leading by changes of form and new systems of management, to such a reduction of cost and extension of accommodation as would have seemed, only a year or two before each improvement, to be fabulous and incredible. Hence a perpetual temptation to fresh tonnage; and hence two million pounds sterling of shipping are lying idle in the Indian ports at this moment.

A New Poison for Rats and Mice.—At the Zootechnical Institute, in connection with the Royal Agricultural Academy at Proskau, a series of experiments has been carried out upon the comparative activity or inactivity of the various poisons most commonly employed for the destruction of rats, mice, and other rodents. The result of these are now published by the director of the Institute, Dr. Crampe. Of all the materials experimented with, the most efficacious proved to be precipitated carbonate of baryta. This occurs as a heavy, fine, white powder, devoid of taste or smell, and can be purchased at any ordinary drug store. In the experiments of Proskau, a portion of it was mixed with four times its weight of sound barley meal, and made into a stiff paste with water, and small pellets of the soft cake introduced into the holes of rats, house mice and field mice. One great advantage of this preparation is that the smallest quantity of it proves fatal. Further, it appears to cause immediate and complete paralysis of the hind extremities, so that it may be assumed that mice eating of it in their holes will die within them, and so not prove destructive in their turn to domesticated animals that might otherwise devour the carcasses. It was found in practice that neither fowls nor pigeons would touch the paste, either in its soft state or when hardened by the sun, so that its employment is probably free from danger to the occupants of the poultry yard. Some rabbits on the other hand, that got access to the paste, ate heartily of it, and paid the penalty with their lives.

Effect of Constant Vibration Upon Iron.—Shafts of side-wheel steamers and propellers sometimes break suddenly, and it is supposed that the constant vibration of certain qualities of apparently sound iron causes a crystallization and loss of cohesion. Lately the steamer *City of Chester* was proceeding at an ordinary rate of speed in clear, calm weather, when, without a word of warning, two blades of her wheel dropped off simultaneously, crippling her at once. The manufacturers and builders believe that an examination of the remainder of the propeller will probably show again that the constant vibration had crystallized the metal, so that the wheel went to pieces all at once, like the deacon's "one-horse shay." The Brooklyn *Eagle* suggests that this gradual crystallization of iron is one of the dangers which threaten the elevated roads. How long the trestle work will retain its strength of fiber under the ceaseless vibration it is called upon to endure, it is a question which only costly experience will determine.

Ventilation of Cupboards.—The ventilation of cupboards is one of those minor matters that are frequently overlooked in the erection of houses, while the want of a thorough draft is apt to make itself unpleasantly apparent to the smell. The remedy of the defect is however, very simple; if possible, have perforations made through the back wall of the closet, and a few in the door; when the wall of the closet cannot be perforated, bore holes freely on the top and bottom. To prevent dampness, with the accompanying unpleasantness and injurious effects of mildew in cupboards, a tray of quicklime should be kept, and changed from time to time as the lime becomes slacked. This remedy will also be found useful in safes or muniment rooms, the damp air of which is often destructive to valuable deeds and other contents.

The Composition of Curare.—An inquiry, says The *Pall-Mall Gazette*, has lately been made by scientific experts in Brazil into the nature of "curaro," the remarkable poison of the Amazon and other Indians, the preparation of which has hitherto been kept a "trade secret" by the Indian manufacturers in Amazonas. Professor Jovert, however, recently contrived to get an Indian expert to confide it to him, and show him the plants and mode of preparation, and himself succeeded in making it and ascertaining also the physiological action of each ingredient. One of these is the powdered outer bark of the *Strychnos castelnæana* another the outer bark of the *Cocculus toxiferus* of Weddell. The watery extract of these barks is boiled down to a proper thickness, after adding leaves of an *aroidea* of the Phylodendron genus, leafy twigs of a *menispermacea*, and four *piperaceas*. By the experiments made at the Rio Janeiro, *strychnos* rapidly paralyzes the motor nerves; the *aroidea* has similar action; the *cocculus* paralyzes the muscles, and especially the heart, but acts much more slowly than the *strychnos*; the *menispermacea* is a general excitant of the nerves, and thus assists the more rapid action of the preceeding ingredients; and the pepper renders the toxical qualities more active.

Mushrooms as Egg-Inducers.—The coming of the rains brings forward an abundant crop of mushrooms in many parts of this State. They are so plenty that the price sometimes hardly pays for gathering. We read in foreign exchanges some statement which lead us to advise our poultry growers to experiment with this material, to test the truth of its alleged value in bringing hens up to their business at certain times in the year. The following is a method said to he largely employed in many parts of Germany, more especially in Nassau, with the object of inducing hens to continue to lay at periods of the year when they are wont to discontinue that useful occupation. The edible fungi of all sorts that may be within reach are collected, dried, and ground into powder. A mixture is then made of half a pound of the powder with one pound of ground linseed husks, two pounds of rye and wheat flour, and half a pound of ground acorn powder; a paste is prepared from it with the aid of a little water, and small pellets of this, about the size of a pea, are given to the fowls daily. To which of the several ingredients the "egg-compelling" powers of this mixture are to be attributed our contemporary has neglected to tell us. We presume the virtue lies in the edible fungi so carefully collected. And if this he the case, it would not he necessary to use all the other substances mentioned, some of which are not easily attainable hy those who desire to experiment.

Killing Clothes Moths.—Prof. C. V. Riley, United States Entomologist, gives the following advice for killing clothes moths: The early days of June should herald vigorous and exterminating warfare against these subtle pests. Closets, wardrobes, all receptacles for clothing, should he emptied and laid open, their contents thoroughly exposed to light and air, and well brushed and shaken before being replaced. In old houses much infested with moths, all cracks in floors, wainscots, shelves, or furniture should he brushed over with spirits of turpentine. Camphor or tobacco should he placed among all garments, furs, plumes, etc., when laid aside for the summer. To secure cloth linings of carriages from the attacks of moths, sponge them on both sides with a solution of corrosive sublimate of mercury in alcohol, made just strong enough not to leave a white mark on a black feather. Moths may he killed by fumigating the article containing them with tobacco or sulphur, or hy putting it, if practicable, into an oven heated to about 150° Fahr.

Paraffine as a Lubricant.—A correspondent of the *Railroad Gazette* announces that the Erie railway has reduced its oiling expenses from $5,000 to $1,000 a year hy using paraffine on passenger car journals, and has reduced the number of hot journals from 535 to 332. It is now used during the winter months, without the addition of any other oil, but it is found that in summer it becomes so limpid that it is hard to keep it in the axle-boxes. During the summer months it is therefore mixed with some other lubricant to give it more "body."

Good Health.

The Sun Bath.

Dr. E. C. Angel gives to the *Sanitarian* his views on sun bathing. He says: "My own personal observation of the efficacious results of the therapeutic use of the solar rays extends over a period of fully 12 years, and embraces a considerable variety of diseased conditions, for the most part chronic." He believes in the use of what he calls a "solarium," and gives farther details as follows:

It is important that the solarium should be well ventilated, and the best results, it will he recalled, are recorded of open air insolation. Modern costume deprives the body so much of light and air that the skin lacks sensibility as well as tone; and there is not only great advantage to he derived from the sun, but there is often much benefit received from exposure to the wind.

The sun alone reddens, the sun and wind conjoined magnificently bronze, the exposed surface in a manner that the winter months will not efface, while the benefits and strengthening effects are still more lasting. Insolation under glass, however, whether white or colored, is a bleaching process, in which there is neither burning nor discoloration.

The construction of a solarium is very simple. Its situation in cities should always be at the top of the house, and a high house at that, that it may admit air, light and sunshine from all sides. The roof should consist of sash and glass—an outer layer of white glass and an inner layer of blue glass—with an air space of an inch or more between. The sides should have double sash as well as double glass, and may he ornamented with varied colors and figures to amuse the eye and please the fancy. This mode of construction will diminish the intensity of the heat in summer and the cold in winter, and practically makes the structure available for every day in the year on which the sun shines.

Leading from the apartment already described should he another, with enclosed sides of lattice, consisting of revolving blinds. This room should he open at the top, and would only he available during the warm season. The use of the blinds are threefold—to screen the inmates, to regulate light and shade, and to temper the winds to the nude tenants.

In conclusion, I will not go quite as far as Voltaire, who advised two dull actors to plant themselves in the sun for six months; but I will take the liberty to urge an increased attention to solar therapeutics on the part of the medical profession, for the sun's rays may be employed with absolute advantage and with as absolute safety.

Without anticipating medical miracles, the professional practitioner may rely upon deriving from judicious insolation such ruddy complexions, hardened muscles, improved digestion, purified blood, enlivened spirits, and invigorated vital powers as shall more than justify all I have advanced in defence or praise of solarization.

Amount of Food for Men vs. Women.

Men eat more than women, when their work is of the same kind. It does not follow, however. that because men eat more that they get more strength from their food, for generally women have better digestive organs, and abstract more nutriment from the same amount of food.

So, too, while men and women eat at the same table, it is observable that they do not eat the same quantities of the same dishes. Men eat more heartily of the force-giving foods than women do, probably because there is more demand for them. This is perhaps the only difference. At a restaurant largely patronized by ladies, I have noticed that biscuit, tea, cake, ice cream, and delicacies were more in demand by women, and meats and hearty food by men. —*Dr. Holbrook.*

A New Treatment for Consumption.—The *Medical Record* gives the following: The theory of cure is to clear the lungs by a mechanical effort, chiefly by manipulating the muscles of the throat so as to cause more forcible breathing; second, to establish perfect digestion; third, to promote a process of healing the tubercles, so that they shall become chalky or calcified masses; fourth, to compel the patients to take plenty of fresh air, sunlight and outdoor exercise. To secure perfect digestion a special diet is ordered in each case, and the food is changed as the power of assimilating it improves. To promote the calcifying of the tubercles the salts of lime, which are found in most vegetable and animal food, must he supplied in a soluble condition; the theory is that too much heat in ordinary cooking destroys the natural combination of these salts with albumen and renders them insoluble to a weak digestion. Outdoor exercise is regarded as so important that the patients are instructed to go out in rain, snow, dampness, or even night air or dew, the habit thus acquired neutralizing the danger of catching cold from such exposure. Only strong head-winds and extreme hot weather need be guarded against. The patients sleep with the windows open, summer and winter.

How Galveston Escaped.—The people of Galveston have proved that the way to keep yellow fever out of a place is to keep it clean and drained. Although that city was formerly subject to a severe visitation of the plague once in three or four years, it has had none for 11 years past, owing to the means taken after the great epidemic of 1867 to put the town in good sanitary condition. This experience is of value with regard to other diseases than the yellow fever, and should be duly heeded throughout the country both in cities, villages and country homes.

Best Season for Fish.—Their quality is best just before the spawning season, when they are in good health and condition. Just after spawning they are least valuable as food. Fish that have not attained the spawning age are always in season.

The Orange.—The orange is very easily digested, admissable in health and disease, and one before breakfast will often prepare the delicate stomach for a good meal better than anything else.

Saturday Morning, Nov. 30, 1878.

TABLE OF CONTENTS.

EDITORIALS.—State Ore Deposit Collection; Manufacture of Ice, 337. The Week; The Next Excitement—with a Qualification; A Long-Lived Meteor; Foundry Notes. 344. The Panama Route from New York; A New Dry Washer; The Standard Soap Works; New Publications, 345. Patents and Inventions, 349.
ILLUSTRATIONS.—West's Ice Making and Refrigerating Machine, 337. View of Aspinwall, Showing Railroad Terminus and Pacific Mail Steamship Wharves, 345.
MINING SUMMARY from Arizona, California, Colorado, Nevada and Oregon, 341-348.
MINING STOCK MARKET.—Sales at the San Francisco California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 340.
NEWS IN BRIEF on page 348 and other pages.
CORRESPONDENCE.—That Stick of Timber, 338.
MECHANICAL PROGRESS.—Progress in Tools for Accurate Measurement; A Ball Safety-Valve; Molten Carbonate of Soda in Puddling; Electric Light on a Velocipede; Fixing the Quality of Boiler Plate; The Metallic Sleeper Problem; A Bridge Made of Old Rails; Large Wheels for Africa; Locomotives for the Elevated Railway, 339
SCIENTIFIC PROGRESS.—Forests and Fungi; The Electric Light Agitation; Practical Result of an Arctic Exploration; United States Survey of the Amazon; The Territorial Surveys; The Need of Correct State Surveys; Acceleration of Nervous Velocity by the Will; Wine Testing in Paris; Microscopy, 339.
USEFUL INFORMATION.—Surplus Ships; A New Poison for Rats and Mice; Effect of Constant Vibration upon Iron; Ventilation of Cupboards; The Composition of Curare; Mushrooms as Egg-Inducers; Killing Clothes Moths; Paraffine as a Lubricant, 343.
GOOD HEALTH.—The Sun Bath; Amount of Food for Men vs. Women; A New Treatment for Consumption; How Galveston Escaped; Best Season for Fish; The Orange, 343.
MISCELLANEOUS.—The Martin White Case; New Incorporations; Who was the First Hydraulic Miner? 333. Mines and Works of Almaden.—No. 11; How they Salted that Mine. 342. Silver Mill Wisdom, 342-343. A Gift to Botanists; Introspection, 343.

NEW ADVERTISEMENTS.

Western Iron Works, Perry Edwards, Prop'r, S. F.; Phœnix Oil Works, Hutchings & Co., Oil and Commission Merchants. S. F.; The Risdon Iron and Locomotive Works. S. F.; Gold Mine Wanted, W. S. Keyes, S. F.; South Pacific Coast Railroad; Delinquent Notice—Mount Jefferson M. & M. Co.

The Week.

In the mining world little of note has occurred during the past week in the domain of legitimate operations. The close condition of the mining share market, even under good reports from the Comstock mines, is indeed remarkable. But it is, nevertheless, attracting more attention than it merits. Of course, the result of the Sierra Nevada crosscut will affect greatly the hopes of the great lode. And yet it has been amply proved already, that at great depths the greatest bonanzas are to be found. The success of the Sierra Nevada ore body will be merely adding proof to proof. Meanwhile it may be said this week as it was last, that in no other part of any State or Territory of our coast is the feeling so universally blue to-day as it is on the Comstock. It is very noticeable that in every other district, whatever the character of the mines, or the state of the weather, the miners are universally cheerful, looking forward with unusual hopefulness towards the coming year. As far as California is concerned, it may be said that their hopes will not prove baseless. As for the quartz mining here, that has assured success, and the placer interests may depend upon unlimited supply of water, the long delay of the rains being a very good sign of a wet winter.

Comparison of the exports and imports of gold and silver coin and bullion exhibits the following: Month ended October 31st, 1878, excess of imports, $2,096,807; month ended October 31st, 1877, excess of imports, $293,169.

The Martin White has made a bullion shipment.

Supt. Weber of the Tiptop mine, took down $20,000 to Phœnix on Nov. 13th.

The Next Excitement—With a Qualification.

A short while ago, Indian district, Mono county, was dubbed "the next country for a rush." A comparatively small district, with nothing but ledge mining to offer, can present little inducement to the general run of prospectors, when compared to a tract of hundreds of miles of placer ground, along the banks of an ever-flowing river. Make these placers yield from $5 to $50 per day to the man, and the temptation to stampede becomes quite irresistible. At present the favored land is along the banks of the Upper Snake, and the glowing correspondent clearly anticipates that a rush is coming.

The Salt Lake *Tribune* has published lately two articles on the Snake river placers, one a short report from a recent visitor at one of the bars on the river, and the other a letter dated Snake River, November 13th. These articles have been quite extensively copied, and already in Salt Lake City a movement of miners towards the north, bound for the river, has begun. The short report referred to says of James Lane's placer mine at the month of Raft river:

"The claim is being worked by the new silver-plated copper plate process, and is panning out from $17 to $20 per day to the man. The ground is worked by four men, who operate two sets of plates. After a ten days' run, completed just before our informant left the mine, a clean-up was made. One set of plates yielded 80 ounces of amalgam, carrying $5.50 in gold to the ounce, and the other set, over 60 ounces of $6 amalgam. Mr. Lane pays his men $1.50 per day and board; the incidental expenses of running the plates are a mere nothing, so that the lucky Lane is making about $70 every day. But the beauty of the Snake river diggings is that they are not confined to any one gulch or bar. The river is 1,100 miles long, and the fine gold has been found along its banks in every bar for a distance of 400 miles."

The correspondence is somewhat more detailed. The copper amalgamating plates are described as one-fourth of an inch thick, of convenient area, and put up like an inverted V. Lane's claim is made somewhat richer than in the above report. "The ground," says the writer, "is now yielding from $40 to $50 per day to the man." The plate-process is described as something new, at any rate for that region. It is, in fact, by means of this process, it is represented, that the Snake river stores of gold are to be made available. It had long been known that the bars of the river contained gold, but experience had proved it too difficult of saving. Now, however, proof is offered of the success of the process and the resources of the country, in the 75 or 100 ounces of gold shipped, after every weekly clean-up, to San Francisco. The writer, forgetting apparently the weakness of human nature, advises all who meditate a "rush" to wait till winter is over. He says, quite truly, that there is plenty of room for all, and closes:

"Aside from its value as a mining region, the Snake river valley is a magnificent country. The river itself is clear, wide and deep, its banks well wooded, and its waters stocked with salmon-trout in indescribable profusion and of extraordinary size. Fishing in this river is most exhaustive sport, and Snake river anglers often throw in a baitless hook in order to enjoy a breathing spell. The country through which the stream stretches is wild and beautiful, and now that cold weather approaches and ye Bannack is on the "swap" instead of on the shoot, prospecting is a perfectly safe employment."

These descriptions may apply well to the lower Snake, after it has turned to the northward, but from all we can gather from reading and from conversing with prospectors who have visited the region, they are hardly applicable to the upper Snake, say from the neighborhood of the Shoshone falls, to the branches in the Wind river mountains. Gold exists all along the river. That was acknowledged long ago, as the excitement of 1870 bears witness. But it is very fine gold, difficult to save. The hostility of the Indians who make the banks their hunting grounds in summer, combined with the difficulty hitherto experienced in getting out enough pay, may sufficiently account for the little attention paid to this region in the last few years. And there is nothing at all impossible in the supposition that at last, by happy coincidence, a peace with the Indians and the discovery of a successful process, have combined to declare a new era for this neglected field.

As we picture it, the region of the Snake river is grand in a kind of barren, terrible beauty. There is the river, wide and deep, cutting its channel through the great lava flood and gnawing more slowly at the porphyry below. It has beautiful falls that should long ago have wakened the enterprise of some Niagara man. It is well stocked with fish, as the writer says. As for well-wooded banks, that is to be doubted, for we know that in calculating probabilities of success for a mining camp on the river, the amount of driftwood brought down has been thought an important item under the head of fuel. Grant that the immediate banks may be wooded. Go beyond them on either side and the limit of inviting scenery has been reached. Nothing but the vast, dreary lava flood with its occasional sage-brush relief—the same barren aspect that frightened Lewis & Clarke, and after them Fremont, so that all turned aside to the north and did not even see the Shoshone falls. Still, many a good thing may come from a barren land, and barrenness holds little ground as an argument when gold is in the question. Snake river may yet prove to have as great a store for the placer miner as it undoubtedly has for the geologist and the tourist.

The river may be reached by way of Kelton or Humboldt Wells. The best season for working, considering the stage of the water and the state of the weather, is from the 1st of September to the latter part of November, and from the early part of March to the middle of May. In midsummer the river is too high, and in midwinter the weather is too stormy. Provisions in plenty can probably be obtained at the river. Without the new process a man may be able to pan out $3 to $4 per day. With regard to the V-shaped amalgamating plates it may be told that a gentleman in San Francisco, who is the inventor and patentee of V-shaped riffles, knows nothing of their use on Snake river. The appliance in use must be something different from a riffle, or it is an infringement. A San Francisco house made lately, it is said, quite large shipments of amalgamating plates to the river.

No doubt we shall soon be more enlightened with regard to these resurrected placers through the columns of the *Tribune*. We hope this may prove to be the case. Meanwhile, we say to the unsettled miner: Investigate before you rush.

A New Dry Washer.

We have just witnessed a test made with a dry washer recently invented by a gentleman of this city. The aim had in view by the inventor has been to devise a machine in which gold might be separated from fine gravel, etc., by air instead of water, as is employed in concentrating tables and riffles now in common use. Such a device is evidently a desideratum. For in many dry places water enough cannot be obtained to admit of the successful working of material known to contain considerable gold.

The machine which Mr. Gawley now puts forward as the result of his labors, may be described briefly as follows: A cylindrical frame about six feet long and two feet in diameter is made in four or five sections. Around these sections is coiled a stout wire. Around the coil of wire again is coiled a wire screening, the sections of the cylinder being covered with screens of different coarseness, the finest being nearest to the hopper. Around the whole is rolled a sheet of zinc, closing the cylinder tightly, and strapped firmly on. Within the cylinder, distributed at regular distances around the periphery, are iron straps, about an inch and a half wide, set on edge and running the entire length of the cylinder. This cylinder or barrel has a shaft at each end, and is fixed nearly horizontally in the bearings, dipping, however, with a slight inclination, away from the hopper. The cylinder is open at both ends.

The hopper end of the machine consists of a large cubical box containing a blower, an ordinary centrifugal one, worked by a crank outside. On the side of this box towards the cylinder is a hole opposite the open end of the latter and through which the blast passes. The gold-bearing material is fed into the cylinder, just ahead of the blast. The axle of the blower is connected with the cylinder by gear, so that the same motion of the crank that produces the blast, revolves the cylinder with a slow, steady motion.

Before describing the test we witnessed, we will state that the apparatus used was a rude one, merely intended to illustrate the principle. In practice, zinc will be replaced by amalgamated copper, in the covering of the cylinder. This covering will be fastened on, not by straps, but by thumbscrews. The blower will be furnished with a balance-wheel.

The material used in the test was a fine, sandy clay, mixed with gravel and brass filings. Brass filings are so much lighter than gold that the machine operated to disadvantage in attempting to save them. Nevertheless the working was well illustrated, and the principle on which its success depends was amply vindicated. The crank was turned, sending a sharp blast through the cylinder. The material was fed down on top of the blast. The light stuff was blown through the cylinder and escaped. The heavier material sank, but being caught between the longitudinal partitions, was elevated as the cylinder turned, and finally allowed to fall again, exposed to the blast. This was continued until the larger pebbles, too heavy to be blown through the cylinder, at one gust, found their way to the "tailings" end, and here put out of the way. After operating for some little time, the crank was stopped, the zinc sheet unstrapped and unrolled. In the bottom of the zinc was found the brass filings, mixed with a considerable quantity of the sand and clay. The finer particles were nearest the hopper end, the coarsest close to the tailings-end. Some of the filings were blown entirely through the cylinder, but not enough to raise any doubt as to the efficacy of the machine in saving gold, when the lightness of brass is considered.

The machine is simple, may be easily transported and more easily worked. Two men can manage it; one turning the crank, the other feeding at the hopper. When the machine is put into working order we hope to be able to report a complete, critical test.

Foundry Notes.

Iron Pipe Manufacture and Ship Building at the Risdon Iron Works.

At the Risdon Iron Works, in this city, they are making 20,000 feet of iron pips for the Sandwich islands, to be used on the the irrigating works of a large sugar plantation, owned by Claus Spreckels, of the California Sugar Refinery. Some of this pipe is 42½ inches in diameter, some 40 inches, 37 inches and 35 inches. Part of it is No. 14, part No. 9, No. 7, and some is quarter inch iron. The pipe is being made in sections of 16 feet each and of four different diameters as stated, for convenience in being made up in nests of four pipes each, for shipment. That is, the 35 inch is put into the 37 inch, the 37 into the 40, and the 40 into the 42, making a piece heavy enough to cover measurement freight. The whole lot will weigh about 700 tons, and will be completed ready to be laid. The joints will be made of lead, under the Smith patent; some 40 tons of lead will be required for these joints.

The Risdon works are at present making about 400 feet per day complete, and have a large number of men employed in handling, steam-punching, rounding up, riveting and caulking the work in its process of construction, and it would well repay a visit to the works, to see the order and regularity with which each division of the work is carried on. The pipe is all carefully made and each piece shows evidence of thorough workmanship.

One of the features in connection with the job is the punching machine, put up by the firm for this special purpose. It punches 12 holes at a time and 40 times a minute, making 480 holes per minute. The plates then pass to the hydraulic inventing machine, which compresses the rivets with a steady pressure of from 10 to 30 tons and noiselessly, does better and truer work than scores of hammers pounding away from morning till night. With these riveters half-inch rivets can be driven cold and as good work done as if they were hot.

The 30-inch pipe, used by the Cherokee Gravel mine, was ¼-inch thick, and has stood a pressure of 400 pounds per square inch for the last four years, not showing any leaks or weakness. Yet all the rivets were driven *cold* by these machines, no caulking being done on the round seams, and only the edge split on the horizontal seams. Numerous experiments have been made to test the machine-driven rivets against those driven by hand, and the machine work has been effectually proved the best, at first, and after continued duty. The holes in the plates may not be exactly fair one with the other, yet the steady pressure will cause the metal to "flow" and fill up every particle of space, so that upon cutting the seam through the center of the rivet the joint and rivet cannot be seen, while in hand riveting such spaces are never filled up. At these works may also be seen the machines for punching by water pressure, and it is the intention of the proprietors to shear as well as soon as they can get the machines made.

This company have already made nearly all the heavy pipe work in this State, having completed in all about 175 miles of pipe, and they are putting up the best class of tools their large experience calls for, so that such work can be supplied at a minimum cost to the purchasers. In connection with this class of boiler-work, the company are doing a large job on the steamer *Bolivar*, an English vessel that came from South America to this port, with the old-fashioned engine and boilers in very bad condition. She was brought to Goodall & Perkins, and given to the Risdon Iron Works, to be altered to a proper boat to carry passengers and coal from British Columbia to this port. She was taken upon Taylor's ways, moved over to one side, cut in two pieces at the middle, and the front portion moved apart 80 feet, in proper position to the after half. The space is being built up with good, solid iron frames and plating, iron decks put in, and new compound engines put on board, making a first-class ship. She will have a tonnage of 1,800 tons, and will make one of the finest ships on the coast. Those desirous of seeing iron shipbuilding in progress will do well to take this opportunity of visiting the vessel on the ways, as it shows that California is not very far from being a shipbuilding port, either with wood or iron. We shall have more to say on the question of shipbuilding in our next issue.

A Strike in the Golden Fleece.—A short time ago we published some account of the Golden Fleece Gold and Silver mining company's mine, 10 miles north of Reno, in Peavine district, Washoe county, Nevada. We are glad to learn from a contemporary that a promising strike has lately been made in the mine. The miners have come upon a vein six feet wide. A specimen exhibited in Reno is described as full of black sulphurets with quartz resembling Comstock ore. It is expected to assay from $75 to $100 per ton. As the tunnel pushes further into the hill it is said that the ore is becoming free of base metal.

W. F. Englebright, of Nevada, has been appointed U. S. Deputy Surveyor for the surveying of mining claims.

The miners in the Prietta mountains, south of Prescott, are said to be having more than usual good luck.

A first-class quartz mill is being made in San Francisco for the Tiger mill.

The Panama Route from New York.

All those who came to this coast by what is known as the Panama route will have a vivid recollection of Aspinwall, as giving them their first views of tropical surroundings. The town, of which we give a view herewith, is on the north side of the Isthmus of Panama, on Navy bay, 48 miles by rail from Panama. The harbor is a good one, and has ample shipping facilities. There are several fine wharves, each owned and used by one of the following steamship lines: The Pacific Mail Co., to New York and San Francisco; Royal Mail line running to Southampton; West India line, plying between Aspinwall and Liverpool, touching at the principal West Indian islands; the Atlas line to Liverpool via New York; the French line to France, and the German line to Bremen. Most of these different lines dispatch steamers twice a month.

The permanent population of Aspinwall is only about 2,500, the white population fluctuating according to the demands of business.

The busiest part of Aspinwall, and in fact, the only part where any business of importance is transacted, is along the water front. The Pacific Mail Steamship Co. built a wharf there some years ago, which cost upwards of $800,000. It is a magnificent piece of work, 600 feet long and covered the entire length with a substantial roofing, in which merchandise is stored when awaiting transfer across the isthmus. At this wharf the steamers of the line land their freight and passengers.

Among the buildings of interest at Aspinwall is the Episcopal church erected about 20 years ago, through the liberality of the Pacific Mail Steamship Co. and the Panama Railroad Co. It is constructed of stone and very handsomely and substantially fitted up. Near the church is a monument erected to the memory of Aspinwall, Stephens and other friends of the great isthmus route.

The place is best known of course as the landing on the Atlantic side for the Pacific Mail steamers. This is probably the best known transportation company in the world, and for many years, before the Pacific railroad was built, brought by far the largest proportion of people to this coast, comparatively few coming overland or around Cape Horn. Even now, with the railroads to compete with it, such are the accommodations offered, that large numbers of passengers travel to and fro by the Mail steamers, preferring a comfortable ocean passage to the crowded and dusty cars. The steamers are commodious, well managed and comfortable, and the fare and appointments being first-class, make the voyage of 5,200 miles a pleasanter one than the shorter trip across the continent by rail. The steamers connect at Panama with the Pacific Steam Navigation Co.'s lines to all the important ports of South America. At Aspinwall connection is made with the various lines previously enumerated. The main office of the Pacific Mail Co. is at No. 6 Bowling Green, New York, and D. S. Babcock, Esq., is President. The General Agents of the Pacific coast are Williams, Blanchard & Co., the offices, wharves, etc., being at the foot of First street, corner of Brannan, in this city.

The trip up or down on the Pacific side is the pleasantest ocean voyage in the world. Glassy seas and sunny skies are the rule. The steamers keep close along the coast, affording the passengers occasional views of tropical scenery and life, as at Acapulco and elsewhere. The vessels in use are all first-class specimens of naval architecture, complete in their appointments, and all possible conveniences are afforded the passengers. The land passage of the isthmus is divested of all discomforts by the railroad, the trip from Panama to Aspinwall occupying a very short time. Our view of Aspinwall, showing the wharf of the Mail Company, is from a photograph by Muybridge, taken not long since. This well-known photographer has made a most complete set of views of Central American scenery, showing all the prominent features and places of the country, with characteristic views of the natives in their various occupations. He has taken the trouble to make a very full and interesting set, so that when bound together the whole is a sort of illustrated description of the country and people.

A Long-Lived Meteor.

August and November are the months in which old earth interferes with the orbits of the meteors, and brings down their sparkling showers upon her. In November, the greatest number of meteor-showers is expected about the 12th or 14th of the month. We are being favored this year with the celestial fireworks rather later than usual. And it seems that some little performances not on the bills have been given in some localities. E. H. Walker, Principal of the Reading, Shasta county, school, has sent to us the following sketch of a brilliant meteorite, that fell Friday evening, the 22d inst., as it appeared to him at Reading:

"It made its appearance at 7:55 P. M., west of north; at an elevation of about 40°, traveled in a southwesterly direction, and disappeared nearly due west. It lighted up the country hereabouts almost as bright as daylight. The remarkable part remains to be told. The trail was the largest, and continued visible for a longer time than any other that I have ever seen or heard of. *It remained in sight to the naked eye for 20 minutes!* Soon after the meteor disappeared, the middle part of the trail began to bend downward and to move eastward, drawing the west branch with it, while the east branch moved westerly. A parabolic curve was formed, both branches extending westward. The curve continued to rise until it attained an elevation of 50° before it disappeared."

On the same evening at Marysville, about 100 miles south southwest of Reading, a meteor was seen. The subjoined account of it was telegraphed to San Francisco the following morning: "A meteor of great brilliancy was seen in the northwestern heavens last evening a little after eight o'clock, moving from the east to the west. It gleamed forth with such splendor as to illuminate the whole city, and made it light as day. After traversing with a hissing noise, the erratic body burst into a shower of crimson and emerald brilliants, which descended in luminous rain until extinguished. It put to shame terrestrial pyrotechnics." These two descriptions must refer to the same phenomenon. But the appearance described by Mr. Walker is certainly very strange, though not unprecedented, as far as the length of time that the train remained visible is concerned. Admiral Krusenstern in his "Voyage," describes a fire ball the train of which shone for an hour after the body had disappeared. During the magnificent display of 1833, trains were noticed that remained visible for half an hour or more.

If Mr. Walker will furnish still further information with regard to the state of the weather, the direction and force of the wind, at the time he saw the meteor, and the apparent constitution of the train, whether it appeared as a continuous streak or an aggregation of particles; and then, if another intelligent observer, in some other distant locality, will report as full data of the phenomenon, as Mr. Walker has sent, it may be possible to make this meteor an important aid to science.

The Standard Soap Works.

Our attention was first called to this meritorious undertaking by the exhibit of the Standard Soap Company at the recent fair. We were glad lately to have had the opportunity of examining their new works at Berkeley. It is generally supposed that a soap factory is the most disagreeable of all places in the world; this had been our experience, and we were agreeably surprised in finding a very different state of things at the works at Berkeley. The establishment consists of a large and handsome structure very strongly built of wood. The main building is 300 feet by 210 feet on the ground floor and five stories high. There is a warehouse 300 by 40 feet, and, also, a number of adjoining smaller buildings.

Besides the universal cleanliness, another noticeable feature is that there is no fire in any part of the building except in the boiler-room. All parts of the building which require heat for any purpose are supplied with steam from the boiler. In the boiler-room is also placed a superheater, in which are to be placed the fats and oils, etc., to be subjected to a pressure of 250 pounds to the square inch of superheated steam. By this means the glycerine will be removed without loss, as is not the case by the present arrangements. When this apparatus is got in running order it is estimated that a saving of some $30,000 to $40,000 per year will be effected.

The general principles of soap-making are perhaps too well understood to require any description, and the finer points of the operation too abstruse for discussion here. Suffice it to say that the fats are heated in large and deep vats by means of steam, with a solution of caustic soda, until the chemical combination of the stearic, oleic, or palmitic acid of the fat or oil with the soda has been effected, and the various impurities of the fats and the soda have separated out. The rest of the operations, perfumings, etc., though very interesting, are not well adapted for discussion in such an article. The two tubs or vats in which the above reactions are effected at the works at Berkeley have each a capacity of 250,000 pounds of finished soap. The price of the raw material which goes into each of these vats for each "boil," as the operation is called, is $5,000. This will serve to give some idea of the magnitude of the business. In most soap factories the soap is ladled out by hand. This would be a tedious operation with a charge of 250,000 pounds, and it is consequently effected by a large siphon tube, moving upon a universal joint, and so arranged that it can skim the soap completely from the layer of *nigre*, or impure residue, upon which it floats. The soap is then run into large wooden molds, so as to dry and harden. When this has taken place, it is cut by strings, stamped, packed, etc. We have of necessity omitted a description of many of the devices for mixing, stamping, etc., and confine ourselves to stating that all the labor-saving devices, many of them original, that it seems could be thought of, are in use.

The boxes used for packing are all made on the spot, from lumber which arrives from Nevada, sawed and cut ready for nailing up. The soda comes from the same place, to be made into caustic soda in the works. Both of these articles are deposited right at the works by the Central Pacific railroad, which literally passes the door, and gives great facilities both for import and export of freight.

In all the arrangements for saving of labor and time, economy and quickness seem to have been equally consulted, and the whole reflects great credit upon the Superintendent, Mr. R. P. Thomas, who designed it.

The number of different varieties of soap manufactured, and the different styles in which it is got up as to color, perfume, etc., would astonish any one who is not familiar with the business. A number of novelties have been introduced by the company, such as the "Initial Soaps," in which an initial letter of a different color is formed in the soap as deep as the center; and the "Metallic Center Soap," in which a thin plate of perforated metal is placed through the length of the cake to keep it together till it all wears out. Another useful article which this company manufacture is the "Marine Salt Water" soap, which, being especially adapted to sea-going vessels, seems to find an extensive sale. But the list of soaps is too long for our space, and we must refer our readers to the office, No. 204 Sansome street, S. F., for further particulars.

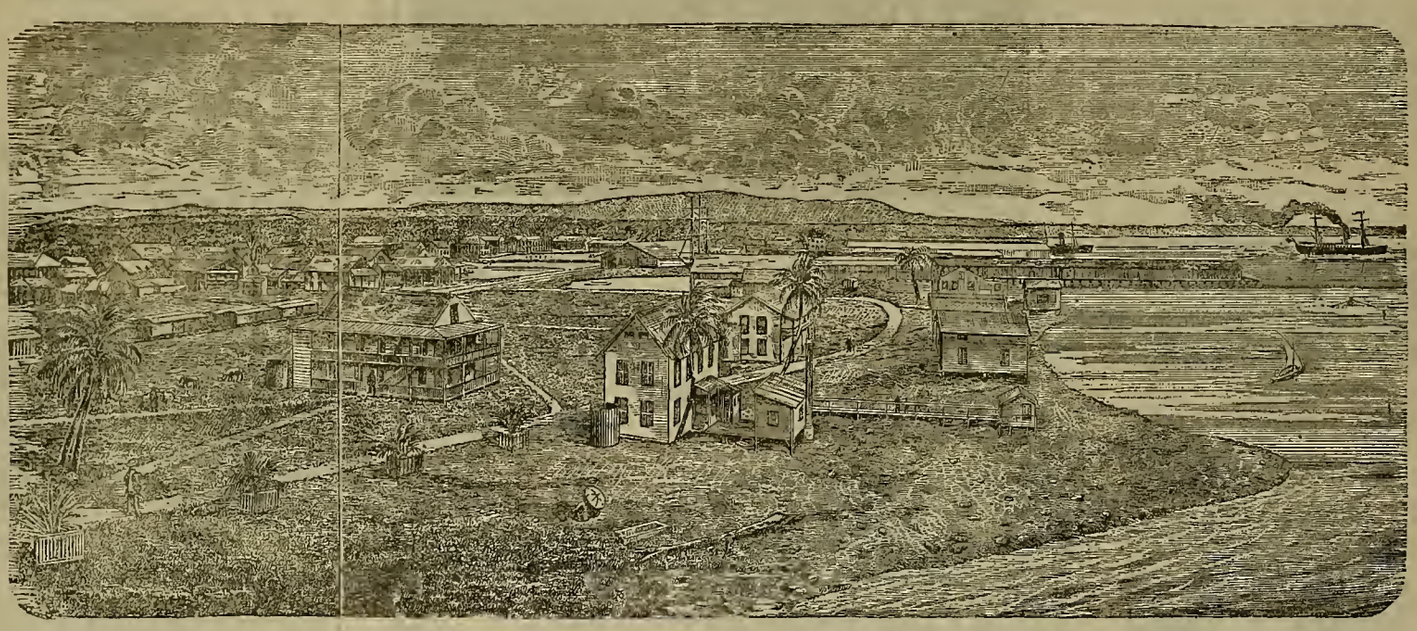
The business of the firm is already quite extensive, extending throughout the Pacific slope from Alaska as far as Panama, and the South Sea Islands. The yearly output is from $400,000 to $500,000 worth of finished goods, and the prospect seems to be that business tact and a thorough knowledge of the technical part of the work will (deservedly) prove a paying investment.

New Publications.

THE AMATEUR'S HANDBOOK OF PRACTICAL INFORMATION.—A little book, under the above title, has been published by the Industrial Publication Company, 176 Broadway, New York. It is intended for use in the workshop and the laboratory. It professes to give minute practical directions for "performing those little technical operations which are so frequently required in every day life, and in the workshop of the amateur. Its usefulness, if the recipes are trustworthy as they are said to be, may be judged of by the list of topics: Bronzing, Lacquering, Polishing Metal, Staining and Polishing Wood, Soldering, Brazing, Working Steel, Tempering Tools, Case-Hardening, Cutting and Working Glass, Varnishing, Silvering, Gilding, Preparing Skins, Waterproofing, Making Alloys, Fusible Metals, Cements, Glues, etc., etc.

THE RELATIVE PROPORTIONS OF THE STEAM-ENGINE.—This is the title given to a course of lectures on the steam-engine, delivered to the students of dynamical engineering in the University of Pennsylvania, by William D. Marks, Whitney Professor of dynamical engineering. A rational and practical method of determining the proper relative proportions of the steam-engine, seems as yet to be a desideratum in the English literature of the steam-engine. These lectures have been written under a realization of that fact. Topics already overwritten are omitted, and those are considered which have not hitherto received merited attention. The book is, of necessity, a collection of mechanical formulae accompanied by necessary general remarks and explanatory illustrations. The formula are reduced to the simplest possible form ready for immediate use. In the directness of these formulae, the value of the book lies. There are fourteen lectures. As an illustration of the matter contained, we give the subheads of one of the lectures: The weight of the rim of fly-wheel; value of the coefficient of steadiness; area of the cross-section of the rim of a fly-wheel; balancing the fly-wheel; speed of the rim of the fly-wheel.

The work is published by J. B. Lippincott & Co., Philadelphia. For sale at Roman's.



VIEW OF ASPINWALL, SHOWING RAILROAD TERMINUS AND PACIFIC MAIL STEAMSHIP WHARVES.

A MILL, that would save both gold and silver, would do well in Big Bug district.

Mining and Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the largest west of the Mississippi), are constantly increasing. These facilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

DEWEY & CO.,
Patent Solicitors,
No. 202 Sansome St., S. F.

REGISTER YOUR TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

DEWEY & CO., Patent Solicitors,
No. 202 Sansome Street, S. F.
A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

A Library for Inventors.

We have at our patent offices, No. 202 Sansome street, corner Pine, a complete set of Patent Office reports, containing engravings and claims of EVERY PATENT ever issued in the United States.

We have also a complete set of the MONTHLY VOLUMES issued by the Department, with full detailed description and large drawings of all the patents issued since the time when these volumes were first published.

A set of all the LAW BOOKS ON PATENTS is also on our shelves ready for reference. We have also the British Commissioners reports, Canadian Patent Office reports for all British North America, full files of MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, *Scientific American*, *Scientific American* supplement, *American Artisan* and other American and foreign scientific and mechanical journals, as well as mechanical dictionaries chemistries, encyclopedias, and other works of reference.

Inventors and patentees are WELCOME TO EXAMINE at their leisure any of the books in the above sets, and we shall be glad to give them any assistance in hunting up what they want.

Our library is the most complete of its kind on the Pacific Coast in every respect, and we are continually adding to it as occasion demands. DEWEY & CO.,
Patent Agents and Publishers,

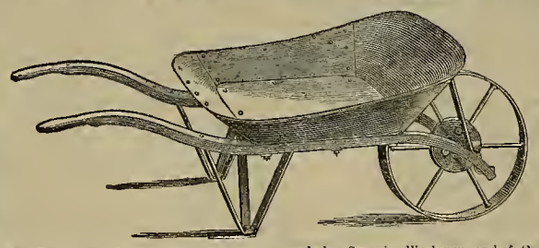
FRANCIS SMITH & CO.,

MANUFACTURERS OF

THE PATENT CHANNEL IRON WHEELBARROWS,

SHEET IRON PIPE.



SHEET IRON PIPE.

The Strongest Barrow Made. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe Also, Galvanized Iron Boilers, from Twenty-five to One Hundred Gallons.

Iron Cut, Punched, and Formed for making pipe on ground, where required. All kinds of tools supplied for making pipe. Estimates given when required. Are prepared for coating all size of pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 BEALE STREET, San Francisco, Cal.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

Office, No. 320 Sansome street, Room 10.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the lights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

Steel Castings.

From ¼ to 10,000 lbs. weight, true to pattern, sound and solid, of unequaled strength, toughness and durability. An invaluable substitute for forgings or cast-iron requiring three-fold strength. Send for circular and price list to

CHESTER STEEL CASTINGS CO.,
EVELINA STREET, - - PHILADELPHIA, PA.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates. Send stamp for our circular and samples.

Machinery.

The Ingersoll Rock Drill.

The lightest, most easily adjusted, and only Drill using rubber buffers to protect cylinder-heads, and with Automatic Feed.

Some of the mines using this Drill on the Comstock Lode, Virginia City, Nevada:

KING ENGINE.

The Only SAFE BOILER

SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the main tending bucket. The frame of the Power is bolted to oak-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,
North Bloomfield, Nevada Co., Cal., October 1st, 1878.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

L. & E. WERTHEIMER, Ag'ts, San Francisco

Continued from page 341.

rate, and the bullion shipments continue very uniform at the rats of about $1,000 per day, which is good for a 10-stamp mill. This company has a force of 50 men at work building a wagon road to Bully hill, which will be completed in about four weeks, and will be of immense value to the company, as it will give access to many thousand cords of good wood and timber, besides lessening the expense of hauling ore from Bully hill about one-half. At the Northern Light, President Whitney and Supt. Dunn are pushing the new tunnel, at a lively rate, and when they reach the ledge with this tunnel, they will have an immense amount of good ore opened above them, both drained and ventilated, which will be of great value to the property, as it will enable the company to extract many thousand tons of ore, before there will be any necessity for hoisting works. At the Potter mine on Bully hill work is going on with a good gang of men at a lively rate, and the ledge continues to have all the characteristics of an immense bonanza. About 40 tons of rock are extracted from this ledge daily, and there could be double that amount taken out if there were mills to work it. In this mine there has been a beautiful vein of copper ore cut the past week. It is three feet thick, and will average $75 per ton; and what makes this so valuable is the fact that the discovery takes place in the tunnel at a depth of about 120 feet from the surface. The Winthrop Co. are pushing their main tunnel both day and night, and are now 300 feet into the mountain, and will continue driving this tunnel until they cut the ledge, which they are sure to reach within the next 50 feet.

TEHAMA.

ITEMS.—San Francisco *Chronicle:* The Cow Creek mines are all owned and operated by Tehama county capitalists. The Donkey mine stockholders are going to erect a mill and reduction works early in the spring. The Afterthought mining company are about to consolidate with the Peck mine company, and commenced rebuilding the works that were destroyed by fire last spring. Should the winter be an open one this mill will be in full running order in 90 days.

NEVADA.

WARD DISTRICT.

Mr. L. Clement reports to the Eureka *Sentinel* that Ward is in a very flourishing condition. Heretofore the ore found there, which was very difficult to handle, has defied everyone who tried to treat it. It is now being chlorinated by roasting with salt, which converts from 93% to 97% of the silver to the chloride, and of this amount 83% is saved by amalgamation. The Martin White mill is working excellently, and crushes 40 tons of ore per day. Its capacity will be raised to 50 tons per day. The Paymaster mine is the most extensively developed of any mine in the camp, and shows a splendid body of ore. The Pleiades is also another very fine mine, and is being rapidly opened up. It is the property of M. T. J. Bell. The Governor mine, the property of the Governor Consolidated mining company, is another very promising property. The Martin White has made one bullion shipment.

BASE RANGE.

PHEASANT MINE.—Eureka *Sentinel:* This very promising property lies on a spur of a line of low-lying hills fringing the eastern side of the canyon, a slight distance south of the once famous Page and Corwin property. The ores of this region were always very rich, and we are glad to note that the ore of the Pheasant mine is no exception to this rule, if assays ranging in value from $400, $800, $2,000 to $4,000, and even $6,000 per ton, may be taken as an illustration of what the place is capable of producing. The outcrop of the lode can be traced for quite a distance above the surface configuration. The location has a linear extent of 1,500 feet, and there is considerable ore on hand at the mine, which will range well into the thousands.

ARIZONA.

AZTEC AND TYNDALL DISTRICTS.—Tucson *Star*, Nov. 7: Progress is being made very rapidly in these districts now. The Toltec and Aztec Syndicates vie with each other in pushing on their works; a large force is now rushing things on mines, and the mills work day and night. Messrs. Magee and Graham of the Toltec, and Superintendent Huntsr of the Aztec have been working the past week on the Sonoita and a large gang of men have been put on the reduction works, cutting mill timbers, ditching, making adobes, sawing lumber, building roads and bridges and taking out ores. Arrangements have been nearly perfected which will ensure two fine mills on the Sonoita, one for the Aztec and one for the Toltec mines. The mines are looking better with each foot of depth attained and this is notably the case in the Bushell and the St. Louis mines. Prof. Thos. Davis just in from Camp Toltec reports another strike in the Bushell shaft at some 70 feet, showing a finer grade of metal than any hitherto found, while the ore is coming into the St. Louis shaft in greater quantity and of a better quality than was expected at the depth reached, some 54 feet. Crosscutting will soon be commenced on the St. Louis, to open the ore bodies on either side of the shaft. Sinking will proceed, however, day and night and the mines be developed on a ratio with the rapid progress of the reduction works. A number of excellent locations have been made in these districts within the past two weeks, as several important sales of mining properties testify, to parties who are bound by the conditions of sale to develop the mines purchased. Some prospecting done on the Gibson, Ermenia, Cleveland, Rochester, Sumner, Monroe, Providencia and other mines has produced most excellent results, the size of ledges determined and first-class ores found, justifying thorough development. The mine owners and prospectors of the Santa Ritas are pushing work on their claims with much more than ordinary vigor now, as they see that reduction works in that section will create a market for their ores. Eastern capital is pushing into this section, and eastern machinery will mill the first ores of the Santa Ritas; eastern men see their opportunity and they have not been slow to avail themselves of it, not only in the Santa Ritas, but thoughout southern Arizona.

COLORADO.

CLEAR CREEK COUNTY.—The Farwell mill treats about six tons per day. The Clear Creek company's mill, F. M. Taylor manager, treats 10 tons per day. Scheyer, Dillingham & Co. will have sampling works at Silver cliff. The Freeland is shipping two carloads of ore per day. The Junction mine has been leased and bonded to Col. W. H. Moore. He has a four-foot ledge averaging over 100 ounces. Robbins & Co., a party of lessees, are operating on the Gunboat lode through a shaft 40 feet deep, and are drifting west on two inches of galena that mills 300 ounces of silver to the ton. A couple of lessees are stoping 100 feet west of the tunnel on a few inches of ore that mills from 200 to 300 ounces in silver. A party working on the Silver Ore lode, are mining successfully. They have a small but steady streak of ore the last run of which yielded 471 ounces per ton for first-class mineral. One of the last runs on Oneida ore milled 850, 500 and 145 ounces, according to the three classes. The prospects are certainly very encouraging at this point and further developments can scarcely fail to secure success.

ITEMS.—The Leadville *Reveille*, says of the Little Pittsburg mine: This mine within five months has made two poor men rich and promises to make two rich men vastly richer, and as yet it is not a twentieth part prospected or a quarter exhausted as prospected. An important agreement has just been perfected by the owners of the Winnemuck, New Discovery and Little Pittsburg, whereby these magnificent properties are consolidated and will be operated under one management. Borden, Tabor & Co. have paid $15,000 for the Eaton lode since the new strike was made. The Smuggler has a heavy body of ore which runs two and a half ounces in gold, ten ounces in silver and 70% lead. The receipts of ore at the sampling works of Eddy & James, from Nov. 1st to Nov. 12th, aggregated 530 tons or an average of 53 tons per day, counting out two Sundays. From one mine in seven days 215 tons was received. They have lately enlarged their works.

OREGON.

GRAND APPLEGATE DITCH.—*Sentinel*, Nov. 13: William Healy, the contractor on the Grand Applegate ditch, reports that a mile and a half of the ditch is complete, and the remainder will be finished by January 1st. The directors of this company are talking of enlarging the ditch so that a larger volume of water can be carried to the mines.

STILL PIPING.—At the mines of Klippel, Hanna & Co., piping is still going on, but if no rain falls within the next 10 days, their supply of water will fail and they will be compelled to suspend operations for a short time. A clean-up will be made when the water gives out. The Squaw Lake company will extend their hydraulic pipe some 600 feet before commencing their winter's work.

GIANT POWDER DECISION.—The following information we get from a dispatch to the *Chronicle*, dated Washington, November 25th

In the case of the Giant Powder Company, appellant, against the California Powder Company's Works et al., an appeal from the Circuit Court of the United States in the District of California—a suit for alleged infringement of letters patent granted in 1865 to the former company upon a new process for manufacturing nitro-glycerine, and combining it with gunpowder and other materials for the purpose of blasting, two of the patents, 4818 and 4819, being re-issues based upon the original—the Court holds that the re-issues must be and are hereby declared void, because they are not for the same invention as is set forth in the original patent of 1865. It is held, however, that the statements show nothing to affect the validity of the third patent sued on, and that the lower Court, therefore, erred in dismissing the bill of complaint as a whole. For this error the decree is reversed and the cause remanded, with directions to enter a decree dismissing the bill, so far as patents 4818 and 4819 are concerned, overruling the demurrer as to the residue and directing defendants to answer. The decision will prevent the Giant Company from collecting royalty from the California Company.

AT the annual meeting of the Challenge Con. M. Co. the old board of Trustees were elected, namely: A. K. P. Harmon, William Sharon, J. D. Fry, J. H. Robinson, and C. L. Weller. About 29,000 shares of the company's stock were represented.

THE miners of Belmont, Nevada, are organizing a union.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington. D. C

FOR THE WEEK ENDING NOVEMBER 12TH, 1878.

SAW GUIDES—James Griffin, Mendocino, Cal.
LOCKS—John Jett, S. F.
MILLS FOR GRINDING ORE—Wm. C. Salmon, John F. Salmon and Wm. H. Harris, Portland, Ogn.
WATER GATES—Philip Giovannini and Bruno Bennerscheidt, S. F.
ORE STAMPS—Stephen Kendall, Jackson, Cal.
SAFETY ATTACHMENTS FOR HOISTING CAGES—Charles W. Lane, Aurora, Nev.
COPY HOLDERS—Henry A. Peabody, Sacramento, Cal.

Notices of Recent Patents.

Among the patsnts recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WATER GATE.—P. Giovannini and Bruno Bennerscheidt, S. F.—Dated Oct. 12th, 1878. This iuvention relatss to certain improvements in that class of stop valves technically known as water gates, and it consists in ths employment of a pair of disks which slide transversely across the pipe in a suitahle ehannel and have their outer faces made to close respectively agaiust suitably formed faces or bearing in the pipes. These disks are moved forward and hackward by means of a screw, which operates through a nut having a channel or groove in its periphery to take hold of the disks. The innsr faces of the disks have each a peculiarly shaped lug, and a similarly shaped loose block between them serves to forcs the disks out of their bearings just as they reach a point opposite to these bearings and when the loose block strikes the bottom, thereby closing the passage effectually. When the gate is to be opened, the first movement of this block releases the disks from their bearings, so they will move easily. This gate is very efficient in pipes of all sizes and under any pressure, and from its psculiar double form and perfect joint formation, it is especially valuable for use in large water pipes.

RE-ROLLING OLN RAILS.—B. P. Brunner, S. F. This invention is intended to economize in the matter of re-rolling old railroad rails which have become battered, until they are worthless for their original use. These rails may, by a system of rolls designed for the purpose, be converted into merchantable bar iron; and it is for the purpose of cheapening this production that the prescnt invention has been made. It consists in the use of certain guides, by which the rail is held in the proper position and prevented from twisting, so that it can be compressed and brought into form with one or two less passes between the rolls than has heretofore been required. This process is also greatly aided by providing certain of the rolls with projecting pins, which assist in drawing the iron through, when it has so few points of bearing that it could not possibly be drawn by the friction between itself and the rolls. The invention, as a whole, is one which will have an important bearing upon a great manufacturing interest.

ICE MACHINE.—W. H. Mansfield, S. F.—Dated, Oct. 5th. This convenient little device was illustrated and described in the MINING AND SCIENTIFIC PRESS, of Sept. 21st, 1878. The ownership of the patent has been assigued by the iuventor to Thos. C. Van Ness and Robt. N. Williams, of this city. The ice machine is portable and intended for family use, where only a small quantity of ice is to be made at a time. The molds are peculiarly made so that a small piece of iee may be removed and the remainder left for future use. From five to 20 ponnds of ice may be made with it in a short time, and anyone can nse it.

BERKELEY CINNABAR.—Mr. J. S. Phillips has examined a small sample of "cinnabar" (?) from the tunnei run near Berkeley. He fonnd no mercury whatever. He says that the formation at Berkeley is all right, so that it would be no strange thing to find good cinnabar there. But the specimen examined was perfectly barren.

THE Bullion Club is the name of a new association of influential gentlemen in New York city, who hope by mutual interchange of information to promote an interest in legitimate mining, and to prevent the negotiation of unworthy schemes.

THE sale of delinquent stock of the Golden Gate Con. Hydraulic mining company is postponed to December 10th.

THE sale of delinquent stock of the Summit Gold and Silver mining company is postponed to December 9th.

THE Monte Cristo S. M. Co. has filed a certificate of increase of its capital stock from $1,400,000 to $2,000,000.

TWO bars of Peck bullion arrived at Prescott Nov. 17th.

News in Brief.

REVOLUTIONARY plots in Peru.

THE Southern Pacific railroad will probably reach Gila City.

and lowering wages.

A NEW deposit of guano is reported discovered on the island of La Ridia.

SCHOONER *Laura Pike* wrecked on Humboldt Bar. Seven persons lost.

LABORERS are being sent to the Colorado desert for the progressing railroad.

BEACONSFIELD, notwithstanding, Parliament will meet on Decomber 5th.

IN case of war with a foreign power, 90 vessels could at once be supplied.

A BARREL of Peruvian yellow potatoes has been received at Washington.

AN English forger has been arrested in San Francisco, and an American defaulter in Lisbon.

IT is rumored that a line of steamers between New York and China is to be established.

IT is estimated that 70,000 boxes of raisin have been made in California this year.

CAMP equipage has been called for by ths English army in South Africa. More war.

HAYES has congratulated the Italian King on his escape from the dagger of the assassin.

THE Russian commander in Roumania has been suddenly ordered to postpone his departure.

THE Italian governmsnt will propose to Parliament measures against secret revolutionary societiss.

AT Cartbagena, Spain, some naval officers have been arrested for being concerned in a Federalist plot.

THE South, during her affliction, received over $1,300,000 relief from sister States.

SOLDIERS from Cuba carried yellow fever to Madras.

ENGLAND has at last succeeded in perfecting her quarrel with Afghanistan, and the armiss are advancing.

THE Commissionsr of Indian affairs will want $5,209,000 next year. This is $500,000 more than the appropriation for the current year.

THE Assayer at Denver is purchasing gold bullion at the rate of $100,000 per month. He expects it will soon increase to $150,000.

SCHURZ has reversed a Land Office decision permitting D. B. Nicholls to purchase eertain lands in Los Angeles district, at $1.25 psr acre.

DURING the 11 years of the bankrupt law, it is estimated that the aggregate failures in the whole country was only 1½% of the whole number of dealers and manufacturers.

SHERMAN will again recommend a new bond of small denomination, bearing less than 4% interest, to enable persons of small means to accumulate sufficient sums to buy 4% bonds.

AN engineer will be put in the field immediately and make a definite location of the route of the Chico and Colusa railroad, and begin to get the right of way.

FREE LIBRARY. — The members of the Mechanics' Institution will meet on Monday evening next, at 8 P. M., in the Institute building, to confer with the Trustees of the S. F. Free Library, with a view to consolidating the libraries and making the Free Library all that it should be. A great benefit may result from united action on the part of all who have at heart the welfare of such important institutions in San Francisco. Books are to save our nation and citizens who have hopes for the country can do nothing better than to aid every endeavor to furnish the masses with abundance of the best reading matter.

THE *Standard* announces the discovery of lignite coal, three and a half miles south of Bodie. It adds that the country has all ths characteristics of coal-bearing regions.

THE bullion shipments from Butte, Montana, for the week ending Nov. 19th, amounted to $12,203.

SOME very rich ore is coming from the 300 level of the Belmont mine.

THE Highbridge is showing more and richer ore than at any previous time.

THE Kelly Lode, Western Nye, is producing $200 ore.

REPORTED rich strike in the Great Western quicksilver mine.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

WE USE on our steam printing press superior machinery lubricating oil from the Phœnix Oil Works of Hutchings & Co., No. 517 Front street, San Francisco.

MODEL MAKER AND MACHINIST.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the eame.

General Robert Allen Silver Mining Company.

—Location of principal place of business, San Francisco, California. Location of works, Pinal County, Arizona.

Notice is hereby given that at a meeting of the Board of Directors, held on the 29th day of October, 1878, an assessment of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the second day of December, A. D., 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the second day of January, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

M. C. SOUTHARD, Sec'y.

Office, No. 411½ California street, Room 11, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named assessment has been postponed until the seventh (7th) day of December, 1878. By order of the Board of Directors. M. C. SOUTHARD, Sec'y.

Land Purchasers' Association —Location

of principal place of business, San Francisco, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1878, an assessment of four (84) dollars per share (being a part of the 43d installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at No. 641 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Saturday, the fourth (4th) day of January, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors. C. S. WRICHT, Sec'y.

No. 641 Sacramento St., San Francisco, Cal.

Mount Jefferson Milling and Mining Company.

—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, Cal.

NOTICE.—There is delinquent upon the following described stock on account of assessment (No. 5) levied on the Seventeenth day of October, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

TUBBS & CO.,

011 and 613 Front Street, San Francisco

Patents for Mining and Farming Lands.

Having complete arrangements with competent and reliable parties in Washington City, by which we are able to secure prompt and careful attention to law business there, we are prepared to assist Mill and Mine, Canal and Ditch owners in securing patents for their lands, mines and claims, in addition to our general line of patent business.

Many who are acquainted with the manner in which this business has heretofore been conducted, (with or without assistance by local attorneys), will see at once the great advantage of patronizing an establishment that is thoroughly orgauized and has its representatives in Washington to look after and prosecute their applications before the Commissioner of the General Land Office. The business on this Coast will be attended to personally by a member of our firm, and satisfaction will be given in all respects.

Correspondence from persons desirous of securing patents for Lands, Mines, Mill Sites, Canal and Ditch property, promptly attended to.

Applicants for patents for mining and farming land, whose claims have been delayed for any reason, will find it to their advantage to consult with us and in case of necessity secure the services of our home and Washiugton branch agency.

DEWEY & CO.,

Solicitors of Patents for Lands, Mines and Inventions, MINING AND SCIENTIFIC PRESS OFFICE, No 202 Sansome St., San Francisco

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals. etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonablo prices. Samples can be seen at our office.

DEWEY & CO.

South Pacific Coast Railroad.

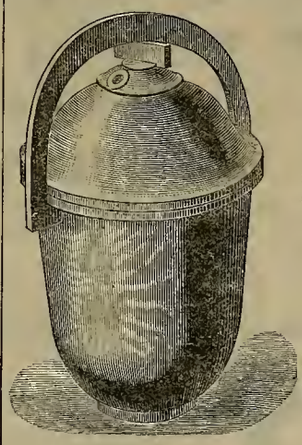
THE NEVADA OVAL TOP RETORT.



The advantage of this Retort over the OLD FLAT PATTERN is, that it can be filled full of Amalgam, thereby holding more than the old style, besides avoiding all danger of an explosion owing to the crown space in the cover which allows for the expansion. They are made extra heavy, WELL GROUND in the joints, and are furnished with a strong Norway clamp, having a wrought iron key which can be driven in or out of place by a sing stroke of a hammer.

The Annoying Thumb-Screws are Entirely Done Away With.

We Make Seven Sizes, as follows:

Number or Pints.....	1	2	3	4	5	6	10
Holds Pounds Quicksilver..	12½	25	38	50	63	75	125
Weight each.....10lbs	15	18	25	31	44	65	

Mortars and Pestles,

Artesian Wells.—No. 8.

The subject of artesian wells still continues to excite interest throughout the State. In another column will be noticed a communication from a gentleman in n county south of San Francisco. He complains of the exorbitant cost of well-boring. A private letter received a short time ago, from the San Joaquin valley, found great fault with the incompetence of men placed in charge of well-boring apparatus. Of these two points well contractors will find it to their interest to take immediate notice. There is no doubt that for cheap work there would be considerable demand. And careless work can never be cheap for any of the parties concerned.

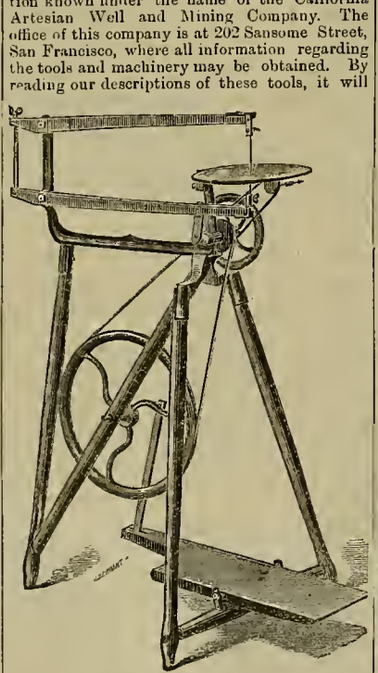
Wells About San Francisco Bay.

We have some account of quite a number of wells bored during the past 20 years or so in the neighborhood of the bay. Part of the information was obtained from an old well-borer, who furnished it from memory. Such cannot be depended upon in all points, but serves the purpose of showing where water can be obtained. At Encinal station, Alameda, is a well 250 feet deep. The water comes within 20 feet of the surface. At 250 feet, manzanita wood was struck; also river-washed gravel of granite, slate, trap rock and quartz. In a well at Fruit Vale, water was struck at 60 feet; further boring to a depth of 380 feet started, if we are rightly informed, no further supply. On the hills near Berkeley, by the mouth of the canyon that passes over to Lafayette, two artesian wells have been bored, respectively 67 and 76 feet deep, giving a good supply of water. Near Temescal is a well 165 feet deep. At San Leandro a well 180 feet deep has been bored. A 60-foot well at Union City flowed eight feet over the surface. A well at Alviso, 190 feet deep, flowed 18 feet. A curious fact may be remembered with regard to the Alviso and Santa Clara wells. The wells in Santa Clara and vicinity were bored first. They gave a magnificent flow of water; some of them do still. But afterwards Alviso men tapped the same strata, and refusing to cap their wells, drew so much from the Santa Clara supply that many wells of the latter place were very materially affected. Wells in San Jose have been affected by the rise and fall of the tide in the bay, a few miles distant. The artesian well which purports to be the first one bored in Santa Clara valley was at San Jose. It was made 90 feet deep. The water flowed 12 feet over the surface. At Menlo Park flowing wells have been obtained at a depth of about 180 feet. At Redwood City, wells 200 feet have been successful. At San Miguel a well 190 feet deep would not flow, but gave water. At the Industrial School, wells (not flowing) strike water at 80 feet and again at 120 feet. A noticeable feature here is that the lower down on the slope the well is bored, the deeper it must go to reach water. In Visitacion valley there have been many flowing wells varying in depth from 60 to over 100 feet. They were bored for Italian gardeners, who raised the water from sumps by means of chain-pumps. In the neighborhood of Bay View park and Hunter's point, flowing wells have been obtained at the depths of 80 and 180 feet.

This rough outline shows that wells may be successful all around the Bay of San Francisco, from Berkeley south to San Jose and thence north to San Francisco. The City Hall well in our city, may now be added to the list of San Francisco successes in this line, although its capacity is not yet known to us.

Well-Boring Tools and Machinery.

Perhaps some idea of the importance of artesian well boring on our coast can be gathered from the fact that quite a number of men in different parts of the State have devoted time to the invention of improved machines, and that Eastern companies are introducing their apparatus among us. Haas & Manning, of Stockton, have taken out several patents on artesian well-boring apparatus. Vaughn & Jackson, of the same city, have also made improvements in the same line. Joseph Bennerscheidt, of Anaheim, is patentee of a well boring machine, also John A. Woodhouse, of the same town. J. M. Creal, of Los Angeles, has invented apparatus for pressing the boring tool down and for revolving it. In another column will be noticed reference to a new large steam borer; the iron work of which is being prepared at the machine shop of Messrs. Thompson & Evans. The well-boring machines illustrated in the last two articles, of this series, are the the inventions of an Eastern man. They are now being introduced on this coast by a corporation known under the name of the California Artesian Well and Mining Company. The office of this company is at 202 Sansome Street, San Francisco, where all information regarding the tools and machinery may be obtained. By reading our descriptions of these tools, it will



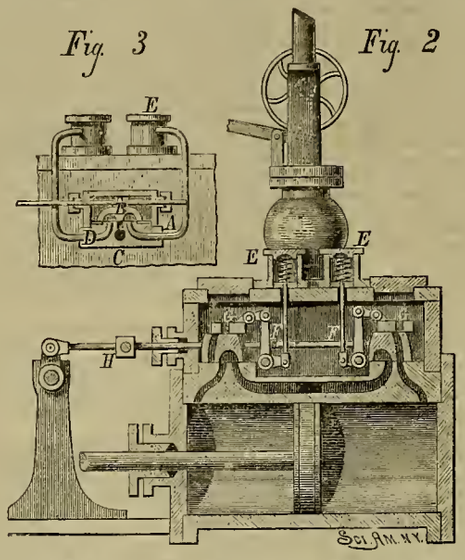
ROGERS' IMPROVED SAW.

be seen that they are certainly very ingenious and complete in appointments. We hope soon to be able to describe in this series, wells bored by these machines.

Since writing the above we have seen in the *Bulletin* an account of the testing of the City Hall well. While pumping at the rate of 2,800 gallons per hour, the water stands 20 feet below the surface in the well.

A Move in the Right Direction.

We learn from Mr. Ross Browne, that W. T. Garratt, the brass founder of San Francisco, has recently made a valuable and extremely useful donation to the University, in the way of various articles of machinery (of his manufacture). And he was kind enough to allow their selection



DINGLEY'S VARIABLE CUT-OFF. (See page 361.)

to be made with the view of making them serve as models for the students in the Department of Mechanical Drawing, thus giving the more advanced students an insight into the application of principles to the details of machine construction.

The articles donated consist of Hooker's double-action and force pump, Hooker's steam pump, an upright steam pump, a hydraulic ram, a steam injector, various steam syphons, whistles, gauges, valve cocks, etc., oil-cups, plain and double-acting valves, cocks, nozzles etc. There is besides a collection of numerous pipe fittings of all sizes. Mr. Garratt was thoughtful enough to append label with the technical name of each piece of apparatus, so that the student is enabled to learn by direct association the shop names as well as the nature of the articles themselves.

It gives us much pleasure to record this generous action, more especially as it shows the good feeling that exists among our practical technologists towards the University. There is no reason why the University should not thus come in personal contact with all the various branches of technology. This action and reaction of theory and practice, cannot fail to be beneficial to all parties concerned. We hope to record many more such donations from others as well in the future. There is no reason why

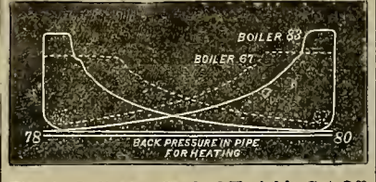


Fig. 4. Indicator Card of Variable Cut-Off

the University should not have a fine collection representing all the various devices of mining, metallurgical and other machinery, in which our coast is particularly rich. We would suggest also that models of furnaces, etc., such as have done service in applications for patents, in law-suits, etc., would be particularly useful, both as models for students, and as a means of comparative study and reference.

Machine-Shop Rambles.

A Visit to Thomson & Evans.

We were shown, this week, through the machine shop of Thomson & Evans. This firm make a specialty of steam pumps and engines, and of all machinery used in and about mines and mills. We were shown rubber tubing being prepared for use as suction hose. A stout wire coil is forced into the hose. This serves to counteract the tendency to collapse during suction. We noticed a stock of all sizes of gas and tube flanges. But the most interesting piece of work at present in the shop is a

New Well-Boring and Drilling Machine,

Being manufactured for a gentleman in this city. The machine is to be run by steam. It will bore, drill and put in pipe. The boring apparatus will be expanding, so that it can be worked under the end of the pipe. The raising and lowering of the tools will be accomplished by simple shifting of belts. The debris will be removed constantly by an endless chain arrangement passing down the bore to a point a short distance above the drill or auger. The iron work of the machine, now being constructed in the shop, will weigh about 2,000 pounds. The wooden frame will weigh about the same. It can be run by a 10-horse power engine; will bore wells of any size, from 6-inch to 16-inch, and in average material is expected to progress at the rate of *a foot a minute*.

The Thomson Patent Pump

Is manufactured at the shop. One of them is set up ready to exhibit to visitors its mode of operating. The eccentric is worked by a crank carried around by a yoke on the piston. The chief peculiarity is in the piston-rod, which is made in one piece, thus preventing all tendency to spring. The valve is a simple slide-valve. The pump is a favorite in the market. About 30 of them have been sold this year. They are used on steamboats, in mines, and for general pumping purposes. One has lately been shipped to the Gold Deposit mine, El Dorado county.

A Combined Air and Circulating Pump

Has just been made in this shop for the steamer *Mary Taylor*. This combination is not met with every day. Ordinarily, in the low pressure, steamboat engines, two separate pumps are required, one to pump the cold water into the condenser, and another to pump the condensed steam and the air out. In the present case but one machine accomplishes both. The dimensions of the pump are as follows: 8 inch steam cylinder; 8-inch air pump cylinder; 5½-inch water cylinder; 10-inch stroke. Total weight, from 2,500 to 3,000 pounds.

Other Work in Hand.

An upright stationary engine is now being made at the shop for experimental smelting works in the neighborhood of San Francisco. The repairing on some 25 steamers is done by Thomson & Evans. The *Constance* is at present being generally overhauled, new pistons, rods and valves being put in. The *Harriet*, the *Alpha* and the *Bouquet* are also on the list. Machine work for several of the Mount Diablo coal mines is also attended to by the firm.

Rogers' Saw.

Messrs. Dunham & Carrigan have furnished us with a description of the Rogers saw. This saw has a cast-iron frame, with all its running parts of iron and steel. The legs are turned wood, of dark finish. The iron table may be tilted for inlaying. A steel back is provided for the saw to run against. The drive wheel is 12 inches in diameter. The machine stands 32 inches high, and is furnished with adjustable clamps, drilling attachment, drill points and necessary wrenches. The total weight in box is 30 pounds.

The examination of applicants for State teachers' certificates has been postponed until December 11th, in consequence of the recent expose of the manner in which the documents have been heretofore obtained.

The attempt to stock the waters of Maryland with California salmon is said to have been completely successful.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Cost of Artesian Wells.

EDITORS PRESS :—Some of the most deeply interested amongst the many readers of your valuable information about artesian wells, may probably feel a laudable curiosity to know something of the probable cost of boring, etc.

I beg to convey a seemingly practical estimate I received a few days since.

If such prices are, as they profess to be, cheap, I fear flowing wells are likely to remain a luxury slightly above the reach of small or struggling farmers—a serious loss to California: "50 feet, $250; 150 feet, $900; 250 feet, $1,600; 350 feet, $2,400; 450 feet, $3,300; 550 feet, $4,300. Including galvanized 11-inch inside pipe and block iron, 13-inch outside pipe to clay bed."

N. B. Hard rock, *extra*.

DRYASDUST.

["Dryasdust" writes from a place within a few hours travel of San Francisco, by rail or water. The prices should not be much above city rates, especially if the borings are made by local well-borers. A San Francisco contractor, says that he would bore the 50-foot well, and drive pipes of the above materials and dimensions (provided he had no rock to drill through) for $4 per foot. For each increase in depth of 50 feet, he would charge at the rate of 50 cents more per foot. The wells above enumerated would cost respectively, $200, $675, $1,250, $1,925, $2,700 and $3,575. These are San Francisco prices. The contractor would charge more if he left the city. But, as hinted above, a local well-borer would not have the same excuse for doing so. The New City Hall well is 180 feet deep, the pipes are 14-inch black, and 12-inch galvanized. The well itself, will cost the city only about $700. We have the contract figures of some other wells that have been bored here. A well 140 feet deep, outer pipe 10 inches, inner, 8 inches, $3 per foot. An 8-inch well, 110 feet deep, $3 per foot. A well about 170 feet deep, 12-inch pipe outside, 10-inch inside, $7.50 per foot, Well 174 feet deep, with pipes same as preceding, $8 per foot. Another well, the depth of which we do not certainly know, but think it was in the neighborhood of 160 feet, pipes 7-inch and 6-inch respectively, was contracted for at the rate of $1.70 per foot. By referring to the PRESS of Nov. 9th, the cost of pipe may be ascertained.

There are well-borers and well-borers. And, as we have suggested on a previous occasion, the best thing for those wishing wells to do, is to club together, buy their own apparatus and material and bore for themselves.—EDS.]

Gravel Deposit.

We have before us advance sheets of the third edition of J. S. Phillips' "Explorers', Miners' and Metallurgists' Companion." From them we extract the following, relating to a subject of great interest to practical miners and to scientists. Theories advanced here will, no doubt, challenge debate :

Gold-bearing and tin-bearing gravel deposits have been accredited to the ancient water-washed bottoms of rivers, but I will endeavor to give reasons for placing many of them, at least, to the account of the more comprehensive disintegrations of debris as caused and concentrated under tidal actions and the surging waves of receding oceans.

It will be admitted by all close observers of mountain formations, that in many places of even extreme altitude water-washed pebbles and salt water shells expose every necessary evidence that the ocean has, at some remote period, overrun such portions of land, and therefore it would be absurd to suppose that the effects of its disintegration and concentrations of the harder rocks would not remain upon the slowly vacated declivities, intervening such high and dry portions and the present ocean.

The principal changes produced by such receding waters would be the breaking up and distribution of enormous quantities of the surface rocks of mountains by the dash of waves upon the shores, which the tides would naturally and continually convey to fill the creeks, basins, and plains at lower positions beneath the water, near the sinuous coast. During this extensive crushing an almost complete separation of the harder stones from the softer portions of the original bedrock would be accomplished, and the former, notwithstanding the water's crushing force, would remain at, and near the shore as gravel beds, while the latter, being softer and more impalpable, would be held in mechanical suspension, and pass far away in the water to precipitate and re-form into much more extensive deposits of secondary rocks. The gold and tin oxide, with platinum and similar metals, being heavy and permanent, would, under such agitation, soon settle to the bottom beneath the hard but much reduced boulders and pebbles of blue and white quartz.

Similar effects would be produced as the water front, with much of its gravel, receded to the transverse spurs and foothills of the mountains, and filled the submerged creeks and inlets with its debris.

Whilst this was being accomplished the various mountain streams would be also discharging gravel, sand and mud into the ocean, which would be distributed along its shore by the surf, in somewhat parallel lines to the mountain itself; but as the water still receded over the almost level plain, this gravel would not follow it any further, because so very flat, and therefore, excepting the small quantity transferred by the mountain rivers, the gravel of this outlying and more remote bed must have been produced closer to where it now lies.

It will be most interesting to notice those natural and extensive parallels to artificial methods for concentration and collection of gold and tin for assay, as seen in the heavy water-worn washings from the alluvially-formed gold and tin deposits of the world. The gold fields of California, which mostly lie upon the lower portions of the western declivities of the Sierra Nevada, may be taken as an example to show the general principle on which all others have been formed and washed into position; as every illustration can be seen here of such formations. This extensive, much distorted and corrugated frontage was once entirely submerged by the Pacific Ocean, and subsequently invaded in a somewhat irregular manner by various elevating and depressing intermittent movements of certain portions of the whole, by the powers created by nearer approach of subterranean fusion and irregularities from the earth's contraction.

Now, we will suppose that the first upward motions were intermittent, and that a few thousand feet only of general elevation of the country changed hight at once, whilst great variations of elevation would occur at some places as compared with others; and that, during this period of uplift the gold had been formed. During the long periods of comparative stability of the country, the rivers flowing from the higher grounds would, by disintegrating the various strata, wash the nuggets of gold thoroughly clean, and which, being much heavier than all the other debris, would be thereby concentrated, and remain on the front beaches or in the hollows and bends of the inlets, ravines and rivers until found and extracted by man.

Whilst this disintegration and concentration was being effected by rains, rivulets and rivers, another not insignificant action was being accomplished by the powerful wash of the ocean on the ancient, but now elevated shore, as urged by innumerable gales, the breaking waves expended their gigantic strength on the crumbling strata, and which released the still remaining gold, boulders, pebbles and sands.

Another uplift would form a second line of auriferous, pebbled shore; as would a third, fourth, etc.; and, lastly, that of the present hour.

The rivers that washed the gravel into the transverse courses towards these now terraced beaches and the ocean, would be much less liable, than such which were governed by hight, to materially change their courses or positions, unless compelled to do so by sudden intrusions of igneous overflowings, which doubtless sometimes prevailed.

If the ocean should again recede from the western slope of the Sierra Nevada, the Sacramento river would still flow through the "Golden Gate," or present river's mouth, in its prolonged course to the new embouchure into the ocean; but the Seal Rocks and serpentine beaches on either side, would be elevated to high and dry ocular demonstrations of such change of level; which, however, would not be so clearly recognized if again buried by alluvium from ocean waters under repetitions of submergence and emergency.

All of these ancient beaches, inlets, ravines and rivers must have been, at a subsequent period, again overrun by the ocean for a very long time, and then more regularly elevated; for the whole labyrinth is now covered with varying, and in some places great depths of alluvium, that could not have been formed in any other manner.

The Sierra Nevada extends for some 400 miles in length, and has an average hight of not less than 6,000 feet, opposite which these gravel deposits lie, and run in a north-northwesterly direction, through several large counties, at about 150 miles distant from and parallel with it and the sea coast. The greatest breadths and depths of this belt of gravel lie opposite the largest areas of mountain wash, and it does not extend much beyond either end, as a river would have certainly deposited it.

It may be well to notice here, that during the ages when these formations were being washed into position, "tidal" waves, caused by subaqueous volcanoes and sudden subsidence of the ocean bed, would be much more frequent and powerful than now, and may have played a very important part in forming and distributing the gravel over the extensive flat ground, between the ocean and the mountain, as these terrific waves swept forward and backward over the shallow waters.

Too much has been credited to river bottoms, and crossings of the one over the other, with intervening alluvions, and too little to the more natural water-washed and weather-beaten sinuous shore of capes, bays, gulfs and creeks, across the ancient beaches of which the modern rivers flow into the ocean.

Transverse terraces of such are found not only here but in many other parts of the world where neither ancient nor modern river beds exist.

The general average north-northwesterly parallel bearing, and close proximity to the Sierra Nevada, the great length, breadth and depth, and consequently vast quantity of the gravel deposits of California greatly favor the idea of its being rather the mighty work of the ocean than a river.

The enormous gravel deposits fronting the mountains of nearly the whole of the North Pacific country, from Lower California to Alaska, and across the continent to the Atlantic, show that they cannot have been deposited by any river or rivers.

The gradual flowing or ebbing of ocean waters will also distribute gold or tin stone over the whole surface of a country, and leave those unmistakable evidences of such works in the shape of innumerable boulders and pebbles, amidst the auriferous and stanniferous sands.

Thus far, the ancient ocean waters had been disintegrating, rounding and distributing these deposits; but at some less remote period, volcanic fire played a no less important part, and disgorged an enormous amount of molten lava over a vast region extending for hundreds of miles in all directions from the eastern part of the State of Oregon. This startling outflow of lava must have proceeded from a vast fissure, as the quantity is almost beyond credence and volcanic cones are scarcely seen.

It appears that this molten lava must have run southerly just in front of the ocean, guided on the one side by the higher shore, and restricted on the other by the cooling effect of the water, and thus directed, it extended over the top of nearly all the gravel claims of California, as it is invariably present, either as a covering cap or amongst the disturbed gravel.

At a still more subsequent period the modern streams from the mountains have cut their seaward ways transversely through these beds of gravel and lava, and in many instances eroded channels, hundreds of feet deep, into the original underlying bedrock, thoroughly exposing the various layers of lava, gravel and rock, for the miner's examination.

These fast running streams have formed, and are still forming and conveying, what may be generally termed, secondary right angled, or present rivers, auriferous bottoms, which are being profitably worked by different suitable methods.

It is probable that this ocean beach auriferous gravel alluded to was in position before many, if not all, of the quartz veins were fractured and filled, for reasons given in previous chapters, and that most of its gold never resulted from the veins.

Placer gold is found either lying on the surface or slightly covered by earth or gravel in higher positions than those deposits described, frequently on high benches, and even on the very tops of considerable hills, where it would be simply absurd to suppose that it had originated from veins.

For the above reasons, and the facts that veins are mostly absent, and do not contain the same kind, shape, or quality, or anything like a sufficient quantity of gold, for supplying that in the gravel, whilst platinum, and other infusible metals, also soluble in chlorine, are found in gravel deposits and never in veins, I think that most of this gold was either washed out from the mountains during disintegration, or has been precipitated from its chloride solution by sulphate of iron or some organic substance to aggregate upon the surface, and get rounded during the subsequent agitation of the gravel.

The alluvial "tin streams" of Cornwall, England, differ from the "gold fields" of California, in having very much less quantity and depth of gravel. The oxide of tin from this source is always pure and very different from vein-tin, which contains impurities of sulphur, arsenic, etc. It is remarkable that tin is also soluble in chloriue, and is found in the alluvial deposits of Banca, where veins are not supposed to be present in the mountains.

Hints on Superintending Well-Work.

Ernest Spon, in his "Practice of Sinking and Boring Wells," gives the following practical hints under the above heading:

The engineer who has to superinteud the construction of a well should be ever on the watch to see whether, in the course of the work, the strata become so modified as to overthrow conclusions previously arrived at, and on account of which the well has been undertaken.

A journal of everything connected with the work should be carefully made, and if this one point alone is attended to it will be found of great service both for present and future references.

Before commencing a well a wooden box should be provided, divided by a number of partitions into small boxes; these serve to keep specimens of the strata, which should be numbered consecutively and described against corresponding numbers in the journal. At each change of character in the strata, as well as every time the boring rods are drawn to surface, the soil should be carefully examined, and at each change a small quantity placed in one of the divisions of the core box, noting the depth at which it was obtained, with other necessary particulars. A note should be made of all the different water levels passed through, the hight of the well above the river near which it is situated, as well as its hight above the sea. The memoranda in the journal relating to accidents should be especially clear and distinct; it is necessary to describe the effects of each tool used in the search for, or recovery of, broken tools in a borehole, in order to suit the case with the proper appliances, for without precaution we may seek for a tool indefinitely without being sure of touching it, and may, perhaps, aggravate the evil instead of remedying it. It is by no means a bad plan to make rough notes of all immediate remarks or impressions in such a manner as to form a full and detailed account of any incidents which may occur, either in raising or lowering the tools. At the time of an accident a well-kept journal is a precious resource, and at a given moment all previous observations, trivial as they may often have seemed, will form a valuable clue to explain difficulties, without this aid, perfectly inexplicable.

When an engineer has a certain latitude allowed him in the choice of the position for a well, he should not, other things being equal, neglect the advantages which will be derived from the proximity of a road for the transport of his supplies; of a well, if not a brook, from which to obtain the water necessary for the cleansing of the tools; and of a neighboring dwelling, to facilitate his active supervision. This supervision, having often to be carried on day and night, should be the object of particular study; well carried out it may be effective, while, at the same time, allowing a great amount of liberty; badly carried out, however fatiguing it may be, it will be incomplete.

Barriers to the Coast Sands.

We have from time to time given paragraphs concerning the erection of barriers to the shifting sands of the seashore, as this is a problem which interests many of our coast readers. As has been stated before, the best results have been attained by securing a growth of shrub or tree, but even to accomplish this there has been found a need for artificial aids while the trees are getting their start. In Europe and on the Atlantic shore, good success has been attained by planting the maritime pine, but whether this or some tree indigenous to our coast should be employed, the process of planting and protecting could be similar. Official reports say that under the patronage of the French government, the planting of the maritime pine along the Atlantic coast of Gascony, has for many years been perseveringly continued, and now cover over 100,000 acres in the single district between the rivers Adour and Gironde. Not only has this wide area been reclaimed and made productive soil, but a still greater extent of fertile land has been rescued from the destruction threatened by the advancing sand hills.

In planting the dunes, a barrier along the shore was found necessary at first to protect the young trees from the rolling sands, which otherwise would bury them. A double line of paling was erected parallel to the shore, and at 100 meters from high-water mark—the second line being a 100 meters further inland. This paling is made of planks, sharpened at the lower end, and driven into the sand. Spaces enough to pass through to bank up equally on both sides, and relieve somewhat the force of the wind by allowing it to pass through these openings. As the paling is covered by the sands the planks are raised one at a time. A movable frame with a long lever, and mounted on runners, so that it can be slid along the top of the fence, and having pinchers and a chain, is easily carried and operated by one man.

The total cost of planting and protecting the pines has sometimes been as much as $40 per acre. The timber of this plantation has long been a source of profit, affording both resin and wood. France now draws an annual revenue of 130,000 francs from the resinous products of these forests. But in this case the greater profit comes from the consequent protection of the adjoining country from the encroaching sands, which had formerly sterilized fertile regions and buried thriving villages. M. Samonas says that "in all France nearly 1,000,000 acres (400,000 hectares) of desolate lands, supposed to be doomed to everlasting sterility, have been reclaimed, and these savage deserts are now stocked with maritime pines which will become for the country a fruitful source of wealth, and supply some day the wants of the whole of France."

A BLOW AT SCIENCE.—Mr. Lewis Swift, the Rochester astronomer, who is a hardware merchant in that city, was standing in his shop the other day, when several pillars with shelves attached, loaded with iron bars and other pieces of hardware, fell over. A blade of a grain cradle struck his hand, inflicting a painful though not dangerous wound. He was standing so that he could see the falling mass coming toward him or he must have been killed. Mr. Swift's friends have bought for him in Boston, a telescope with a 9-inch aperture, costing $3,000. Mr. Swift has become known by many published observations, the latest being the sight of an intra-mercurial planet during the late solar eclipse.

THE Bald Mountain gravel mine at Forest City, Sierra county, has eight miles of drifts and over 250 men employed. It has paid $664,000 in dividends during the last six years, $1,300,000 in gold having been extracted.

THE condition of the iron and coal trades in the South Staffordshire district, England, is growing worse, and the closing of the works and the reduction of wages are noticed.

MECHANICAL PROGRESS.

The Brake and the Rudder.

A speaker at a recent meeting of an English mechanical society pushed the problem of braking railway cars and the steering of ships beyond the realm of present devices. He said: Just as the question of the best brake is now found to lie beyond the mere means of applying it, so the best steering apparatus may be found to involve more than the mere means of turning the rudder. It may be that the whole power of the engines of a ship will be brought to bear in bringing her round. Indeed, this has been already done in the instance of twin screws; and certain recent inventions are said to apply this power at still greater advantage. As regards the turning power of ships, therefore, it is clear that although there doubtless is a limit, yet, owing primarily to ignorance as to what the turning powers of our screw-steamers really are, and also to the insufficient power now applied to turn the rudders, we are far from having reached the limit; and we may fairly hope that the risk at present attending the navigation of screw-steamers will, inasmuch as it depends on want of turning power, be considerably reduced. That we shall eventually develop to the utmost the powers of stopping and turning, whether on railways or on ships, and make use of all our scientific knowledge to discover those methods, may, I think, well be argued from the progress of late years.

A NEW UNICYCLE.—A Danish inventor has invented a single wheel where is arranged a seat for the traveler who is to propel it. The wheel has one central rim, and to this are fixed the arms, which are (say) six or eight in number, half of them swelled, extended, or bellied out to one side, and half of them similarly to the other side, each set of arms being fixed to a nave or boss; these arms are bent out so far and the naves are so far apart that the traveler when in the sitting posture finds room in the wheel between them. The arms are by preference not arranged opposite to one another on the two sides but intermediately. The naves carry each a crank, and these cranks are by connecting rods jointed to two bell-crank levers having one arm placed about upright in a position convenient to the traveler to take hold of for working them backward and forward alternately. Each bell-crank lever has its fulcrum in the seat for the traveler, which seat is hung from the naves or axles of the wheel. The seat is by preference made in scroll form, of light open worked steel plate or wirework, or partly so, and may have a part extending overhead to carry an awning to protect against dirt thrown up, and against rain. From each nave there may be hung a leg serving to steady the velocipede while entering the same, but which can be thrown up out of the way when traveling. The wheel, arms and the rim may be fitted with stiffeners or diagonals to distribute the weight or strain over the rim as much as possible. The velocipede may be eight feet and upwards in diameter, and is said to be very successful in its operation.

LIGHTING AND EXTINGUISHING STREET LAMPS. An English device for accomplishing this work is described as follows: Pipes were suspended so as to connect a group of 15 public lamps. These connecting pipes are really small pneumatic tubes which, if the system were extended, would be carried under the ground and so applied to the lamps as to extinguish the gas at will by means of a vacuum caused by the suction of a pumping engine kept at any center from which the apparatus might be worked. In order to save the labor of going round to relight the lamps each night, a tiny branch, protected by a perforated shield, is placed close to the usual jet, and this is intended to remain lighted all day, ready to ignite the ordinary jet upon the gas being again turned on full in the evening. Obviously this would necessitate a small additional consumption of gas by day, but the inventor states that this is far more than counterbalanced by the quantity saved through simultaneously extinguishing the lamps, and also by making it possible to dispense with the services of lamplighters. He thinks it possible, however, that even the supplementary little jet might be saved by the application of electricity in relighting the gas lamps.

NOTES ON CAR WHEELS.—From an article on the Pennsylvania railroad in the *Polytechnic* we glean the following points: The wheels are made upon the now well-established process—the invention of W. G. Hamilton—of combining cast-steel with the very best grades of charcoal iron. In this manner a metal is produced which it is almost impossible to break. Although the form of the axles is probably as perfect as any that have ever been produced, yet the greater claim to excellence lies in the quality of the metal used in their construction. They are made from soft crucible steel out of Swedish charcoal iron; are carefully turned to the proper size throughout; and, before accepting them from the maker, are subjected to the following test: From every lot of 50 axles one is taken at random, and tested under a drop, weighing 1,840 pounds. The axle is placed upon supports three feet apart and struck in the center. If the axle bears five blows, of 25 feet each, without breaking, the lot is accepted.

COMPRESSION IN CASTING STEEL.—In some recent French experiments it was noticed that when a lid of cast iron was placed upon a mold after casting, the ingot produced generally showed a zone of blow-holes near the surface and on all sides, while within it the block was entirely sound. Whenever the mold was not covered the entire mass contained blow-holes. This, it was argued, was due to the pressure of the gases, and consequently experiments were made by Bounard with more than 100 tons of steel, which proved that a pressure of 6 to 10 atmospheres acting upon the interior of the ingot would make the metal solid. The mold is covered with a lid in which there is a central casting opening. It has a pipe through which steam may be introduced. The steel is cast through the central orifice, which is closed, and then steam is admitted. A copper wire is used for packing the lid. The work must be rapidly done and the mold be previously heated. In order to make the action of the pressure affect the interior of the ingot the chilling of the surfaces must be prevented, which is done by heating, before casting, the fire-brick lining of the inner surface of the lid. The ingot thus cast shows a depression on its upper surface. It was found that in using steel for cannon the number of compressed ingots rejected was only one-third of the number of ordinary cast ingots. Experiments made to apply the same principle to steel castings showed that although the application was more difficult the result was the same.

A STREET CAR STARTER.—Appliances for street car starting have been brought forward by Pacific coast inventors and described in these columns. They are also proposed abroad. We read of an English apparatus which consists of a couple of clutch bevel pinions upon the axle of an ordinary pair of car wheels, the teeth of the pinions facing each other, and the pinions having in connection with them a horizontal bevel wheel, which is always in gear. This wheel is in a piece, with a drum on which a chain can be wound from either side, according to the direction of travel of the vehicle. The chain is attached to a rod leading from a saddle plate, which is free to slide upon two hollow bars or tubes to compress helical springs which are upon them. The clutch pinions are fitted loosely upon the axle, and these can be caused to turn by clutch boxes which are keyed upon the axle, when a lever, which is within reach of the driver, is acted upon in the proper direction by him. A lever is fitted at each end of the vehicle to suit the two clutch boxes, and these are connected by a transverse tie bar, so that the release of the clutch from either end can take place when desired. The transverse tie bar is attached by rods to foot plates—one at each end of the vehicle—so that the apparatus can be released by the conductor at the tail of the car, or by the driver at the head or front as occasion may require.

LIFE PRESERVING BULWARKS.—At a recent meeting of the Manchester (England) Mechanical Society, Mr. Gadd proposed to form the upper portion of the bulwarks of ships of loose sections composed chiefly of hollow thin metallic tubes divided into compartments by diaphragms, the sections to be about 12 feet long, each to be divided into a number of compartments of any suitable form, and provided with projections on their under sides so as to be fitted on to the place of the top rail of the bulwarks and to be a substitute therefor. These sections when immersed in the water would form so many pontoons, and would be provided with cords and loops along their sides, and in the event of the ship going down would be lifted out of their place by the action of the water. He would also construct the whole of the seats on the deck in the same manner, and underneath every seat, and along the entire length of the bulwarks and lying on the deck, other floating tubes could be provided. In the case of sea-going vessels, he would fit the bulwark tubes with holes, rings or slots, so that in case of foundering they could be jointed together either before or after taking to the water. The great advantage of this arrangement would be that it would be in perpetual readiness for any sudden emergency, and there was no doubt that vessels could be readily fitted in this manner.

A NEW SIGNAL OF WARNING FOR DANGEROUS COASTS.—A foreign journal, translated by the *Iron Age*, describes a new method of giving signals of warning at sea that has recently been perfected, and is now employed with success at one of the most dangerous points on the coast of Bretagne. The signals consist of sounds, which are repeated at short intervals, and can be heard, even against the wind, at a distance of six kilometers. The apparatus by which these sounds are produced is self-acting and very simple. It consists of a hollow cylinder, a few centimeters in diameter and three or four meters long, closed at the lower end and secured by an anchor to the bottom of the sea. In this cylinder is found a pump which sucks in the air, compresses it and sends it out through a whistle, and this pump is worked by a huge fagot, floating on the surface of the sea, and whose movements, rising and falling with the waves, furnish the sufficient force. This apparatus is said to have been invented by an American.

SCIENTIFIC PROGRESS.

The Carbon Button.

This invention of Mr. Edison, upon which depends so much of his success in telephony, is described by Prof. G. F. Barker as follows: It was the nucleus of a whole crowd of inventions of Mr. Edison. It arose out of a long series of experiments, and had been brought to perfection only within the present year. It consists simply of a certain variety of lamp-black, which is compressed by a screw press in steel dies, to form a disc about one sixteenth of an inch long and over half an inch in diameter. In experimenting all forms and varieties of carbon and all conditions of condensation were used. It was found that the smoke of a mixture of kerosene oil and petroleum naphtha, in equal proportions, burned in an ordinary petroleum lamp, the wick being turned so that the smoke formed upon the chimney, which was collected, furnished the best material for the purpose. A quantity of lamp-black, exactly as it was taken from the lamp chimney, was exhibited in a bottle by Prof. Barker. The peculiarities of this material, he went on to say, are twofold. (1) It is the finest variety of lamp-black which can be artificially produced. (2) Its great conductivity; it is quite as good a conductor as spongy copper. A certain quantity is weighed out carefully and placed in a steel die, and is subjected to a pressure of 1,200 pounds to the square inch. This constitutes the carbon button. It can be used as a portion of an electric circuit, as an electrical resistance, first, on account of the conductivity of the lamp-black, and, secondly, with the pressure which is exerted upon it. This electrical resistance varies in accord with sonorous vibrations. In practice it is placed in a small case, into which is dropped a little disc faced with platinum. Contact is made at the top and bottom with wire. It may be adjusted to any resistance within the range of its own limit which may be chosen. The limits may be varied also by the pressure employed in making the carbon button. If the pressure is increased the sensitiveness of the button is very materially increased.

DREDGING IN THE GULF OF MEXICO.—Further dredgings were carried on in the Florida channel by Mr. Agassiz and the officers of the United States Coast Survey steamer *Blake*, during March and April last. Large numbers of Pentacrinus were obtained—20 perfect specimens in all. The Marquesas islands were found to have been formed in the same manner as the great Alacran reef—*i. e.*, it is an atoll. It was found that the deep-water fauna on the western slops of the great Florida bank corresponds with that of similar depths on the eastern slope of the Bank of Yucatan, and that this deep-water fauna extends over the bottom of the Gulf of Mexico, until the line running from the 100-fatham line in the latitude of Tampa bay toward New Orleans strikes the Mississippi river slope. Here, owing to the presence of dark, rich mud, the former was very different; while the hauls in still deeper water off the Mississippi yielded no specimens of importance. Throughout the cruise below 500 fathoms forms characteristic of deep water in all the deeper basins of the ocean were obtained, while the species characterizing different local faunæ occurred at a lesser depth.

GAS TURNING THE CRANK FOR ELECTRICITY.—A report from Philadelphia of a lecture by Prof. Barker on the 13th ult. on the electric light gives some statements concerning the economy of the light as compared with gaslight, which, if true, are the most astonishing of anything we have yet seen. The *American Manufacturer* says: In the course of the lecturer's experiments, a Schleicher gas engine was used to drive the dynamo-machine. It is stated that the engine did its work well, and its operation was peculiarly interesting from the fact that the gas used in driving the engine was the ordinary illuminating gas. Of this there was consumed in driving the engine about what would be consumed by four five-foot burners—say a quantity of gas that would give light equivalent to that which would be emitted from 80 to 100 sperm candles; but this quantity of gas, after being first turned into power, the power being next turned into electricity, and the electricity being turned into light, emitted light equal to that of about a thousand candles. The gas, by these transformations, was made to yield an electric light about 10 times its own light-giving power.

AT THE NORTH.—We lately mentioned the return of the unsuccessful Howgate polar expedition, under Captain Tyson. It seems, however, that they made some interesting observations. The most extreme cold, as recorded by Mr. Sherman, the meteorologist, was experienced Jan. 21st, when the thermometer fell to minus 52 degrees. The warmest day was the 8th of June, when the temperature rose to 55½° F. The longest sustained period of cold was from March 5th to 18th, when the thermometer ranged 40 degrees below zero. Rapid changes of temperature were noticeable, amounting often to 6 or 8 degrees in an hour. Some very curious specimens of uncivilized art, in the nature of Esquimaux drawing, were brought, illustrating the various native pursuits, such as hunting the deer, seal and whale.

Electricity in Thunder Storms.

Mr. Elisha Foote lately read a paper before the Philosophical Society of Washington upon the cause of electricity in thunder storms, in which he strongly endorsed the views of Armstrong and Patterson that condensation was the real cause, instead of friction as claimed by Farraday. At the valve Farraday found no electricity, as he shows, but Patterson and Armstrong found it at a distance of five or six feet, and that, too, in sufficient abundance to prove the same conclusively. Friction could not under these circumstances have produced the sparks, but all the facts point to condensation. The tops of the mountains surrounding Pike's Peak are covered with perpetual snow. During the summer months the snow line gradually recedes up the mountains, and large quantities of water are poured out on the plains below. This produces moisture and the winds from the prairie carry this moisture up the mountain to the frozen regions above. About noon of each day large masses of heavy black cloud concentrate about the tops of the mountains and soon pour forth floods of rain. While this occurs flashes of lightning are incessant, and it is said by those who have witnessed it that the peals of thunder are so terrific that they seem to shake the very mountains themselves. Here, certainly, is no friction, but on the other hand a striking case of condensation, which is attended with effects similar to those observed in the condensation of steam from the boiler. Volcanoes in emitting clouds of flame and smoke are attended with flashes of lightning, but these flashes of electricity are found in all directions, far from the sides of the mouth of the crater where the steam meets with colder air and is condensed. Were it due to friction it would be found at the mouth of the volcano.

FOR THE POLE OVERLAND.—We read in an Eastern exchange that a party of enterprising explorers in search of the North Pole left Indianapolis on the 7th ult. They are even hopeful that in the extreme northern regions they may be able to find some traces of the long-lost explorer and navigator, Sir John Franklin and his followers. The party will proceed to the Red River of the North and descend said river as far as Pembina. From the latter place a small steamer will carry the exploring party as far north as navigation will permit. They will then proceed as best they can to Fort York, on the west side of Hudson bay, in about 58° north latitude. At this point they will put their boats together, carried in sections, *a la* Stanley, and launch them and push as far north as 80° before going into winter quarters. We understand that the Governor-General of Canada has received instructions from the home government in Great Britian to aid and assist the expedition in every possible way. A band of 50 tried Esquimaux trappers and fishermen are engaged to accompany the explorers. The Esquimaux are thoroughly equipped for the voyage and provided with trained dogs, sledges, reindeer, etc., and can travel at a rapid pace.

LIFE ON MARS.—According to the *Iron Age*, Prof. Lockyer is of the opinion that human life on the planet Mars may be very much like life on the earth, the light cannot be so bright, but the organs of sight may be so much more susceptible as to make the vision quite as good; the heat is probably less, as the polar snows certainly extend further, but by no means less in proportion to the lessened power of the solar rays. He agrees with others, that several very remarkable seas, including inland seas, some of them connected and some not connected by straits with still larger seas, are now definable in the southern hemisphere, in which, as is the case also with the earth, water seems to be much more widely spread than in the northern hemisphere. There is, for example, a southern sea exceedingly like the Baltic in shape; and there is another and still more remarkable sea, now defined by the observations of many astronomers, one near the equator, a long straggling arm, twisting, almost in the shape of an S laid on its back, from east to west, at least a thousand miles in length and a hundred in breadth.

A NEW METAL.—M. Delafontaine announces the discovery of philippium, a new metal. He has obtained from gadolinite an oxide of a really new metal, to which he gives the name of "Philippium" (Pp.), in honor of M. Philippe Plantamour, of Geneva, the friend and student of Berzelius. Supposing "philippine" to be a protoxide, its approximate equivalent is between 90 and 95. M. Delafontaine describes in the *Comptes Rendus* some properties of its formiate, sulphate, nitrate, etc. "Philippium" gives well-marked characteristic bands in the spectroscope.

THE AZTECS IN NEW YORK.—Mr. William L. Stone advances the opinion that a race not as yet classified, but probably of Aztec origin, once occupied certain portions of central and eastern New York. He founds this belief upon sundry pipes, copper and bronze spear heads and spears which have been found within the last year or two near Seneca Falls and Saratoga Springs. The terra-cotta pipe is wrought with the Egyptian or Sphinx-like cast of features, so different from any of the rough earthenwork of the American Indian, but not at all unlike the discoveries made in some of the Ohio mounds.

Mining Share Market.

The market has been extremely dull for the past week, not having recovered from the crash. Sierra Nevada seems to have fallen entirely out of sight—that is, as a leader of the market. The fluctuations along the whole line have been comparatively light during the week. This has been the case with Bodie and Eureka Con., as well as with the Comstock. Eureka Con. has shown great vitality. The stock has been as high as $37.

Report comes of a Nevada mine that has been compelled to shut down on account of the heavy discount on its bullion. Another mine in Ward district will soon, it is hoped, become a regular bullion-producer—may be a dividend-producer. On the Comstock, the Julia drift of the Sutro tunnel is encountering great heat, so great that the shifts have been shortened to six hours. This difficulty of high temperatures at great depths on the big lode looks, at present, more serious than it probably really is. The tunnel, when connection has been made with more mines, can hardly fail to accomplish one of the grentest aims of its projector.

Bullion Shipments.

Since our last issue, we have noticed the following shipments of bullion:

California.—Bodie, Nov. 25th, $8 500; Nov. 29th, $9 622 26; Extra, Nov. 14th, $1 732; Nov. 19 h, $3,818; Oriental Con., Nov. 28th, $5 000; Standard, Nov. 17th, $19,714 11; total for Oct., $87,401.62; Nov. 23d, $16 116.25; Nov. 25th, $15,725.91; Nov. 28th, $17,055.09; Dec. 1st, $17 209.

Nevada.—Belmont, Nov. 18th, $3,568; Nov. 23d, $1,892; California, Nov. 23d, $141,545 25; total to date, $319.986 29; Nov. 30th, $152,400.45; Grand Prize, Dec. 2d, $28,000; Hillside, Nov. 29th, $5,600; Dec. 1st, $5.378; Dec. 3d, $5 200; Hussey, Nov. 19th, $3,100; Independence, Nov. 29th, $15,500; Indian Queen, Nov. 18th, $3,967.11; Nov. 25th, $3,620.83; Jefferson, Nov. 18th, $1,412.65; Nov. 25th, $1 846.29; Nov. 26th, $1,850; Nov. 29th, $1,984.24; Leopard, Dec. 3d, $5,800; Manhattan, Nov. 21st, $11,758.21; Nov. 25th, $10,800; Nov. 26th, $11,500; Dec. 1st, $11,100. Navajo, Nov. 25th, $6,000; Dec. 2d, $5,600. Northern Belle, Nov. 18th, $3,893 38; Nov. 20th, $3,435.84; Nov. 23d, $4,667.77; Nov. 25th, $3,227.23; Nov. 28th, $3,015.35; Nov. 30th, $3,580.46. Raymond & Ely, Nov. 20th, $7,205.76; Nov. 26th, $6,772.61. Starr & Grove, Dec. 3d, $6,000. Manhattan, Dec. 4th, $11,300.

Idaho.—Black Jack, $11,080.90. Mouarch, $1,500.

Utah.—Christy Con., Nov. 25th, $5,392.

PACIFIC COAST POSTAL CHANGES.—Pacific Coast Postal changes for the week ending Saturday, November 30th: Offices established—Gasquet, Del Norte county, Cal., Horace Gasquet, Postmaster. Ely, White Pine county, Nev., James A. Rokohe, Postmaster. Williams' Creek, Jackson county, O., John T. Layton, Postmaster. Willoughby, Wasco county, O., Archibald Wilson, Postmaster. Name changed—Scotts, Wasco county, O., to Rockville, Thomas S. Laus, Postmaster. Postmasters appointed—A. P. Moor, Clairville, Sonoma county; J. M. Single, Ætna Mills, Siskiyou county, Cal. Jacob D. Smith, Carlton, Yamhill county, Oregon.

RESTAURANT RE-OPENED.—The Palace restauraut on Sansome street, ncar California, has been re-opened by the experienced caterers, Horst & Toedter, and lower prices than ever before are visible on the hill of fare. We are glad of the re-opening. The Palace was long our noonday resort, and we trust the now proprietors will succeed in their enterprise.

WASHOE SUMMARY.—Up to the hour of going to press our usual summary of Washoe mining matters had not arrived.

THE Committee of the Constitutional Convention on mining interests are satisfied to have things remain as they are.

A COMPANY has been incorporated to work the Crosscut claims, Humbug district, Arizona.

THE McCracken M. Co. have recently discovered a large and rich body of ore.

WORK is to be resumed on the South Wellington coal mine.

MEXICAN miners are doing pretty well in and near Antelope and Woaver creeks, Arizona.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

PLYMOUTH.—*Ledger*, Nov. 30th: The Phœnix mine, it is reported, has changed owners, a New York company being the purchaser. Report says the price is $8,000,000. Henceforth the mine will be known as the Empire, so called after the Empire State. Timbers are now floating through the ditch in large quantities. The ditch is running nearly full of water, but not enough to run 80 stamps. The rock has become very hard of late, but has suffered no diminution of value. If anything, it is richer than before. The Burleigh drill is working day and night. W. Sargent, formerly an employe of the Phœnix, has charge of the Centennial mill. He is quite an expert in the business. The sulphurets are looking rich. The stock has advanced a little. Fair prospects for a paying mine. The hoisting of ore has not commenced as yet.

VOLCANO.—*Ledger*: Downs' mine continues to look favorable. The north tunnel is in 41 feet, with a 4-foot ledge at the breast. The south tunnel extends 28 feet, with an average width of the ore body of two feet. The ore maintains its quality. It is confidently expected that all of the quartz now being extracted is fully as rich as that of the last crushing, which yielded $45 per ton. W. W. Downs, cousin of the owner, is foreman of the works. Moyle's mining works at Volcano Flat will consume in the neighborhood of 100,000 feet of lumber. Stewart's mill at Volcano will be all ready to start up again some time next week. A parcel of quartz from Jones & Robinson's claim will be the first operated upon. Wash. Porter has charge of the mill. He has been identified with the mining interests of Volcano district for 25 years. The machinery for the Moore mill is being placed in position. In the mine everything looks healthy.

SUTTER CREEK.—At the Amador Con. mine Sunday work has been suspended for the present. The increased size of the ore body enables the miners in six days to get out enough rock to keep the mill going the whole week.

CALAVERAS.

COPPEROPOLIS.—*Chronicle*, Nov. 30: Copperopolis is beginning to show some signs of new life. A Mr. Hicks, of Boston, has lately arrived and assumed full charge of the Union mines. From all appearances he seems to mean business. He is having everything about the mines overhauled and put in shape for work. He has also on the ground a new engine intended for the Moonlight shaft. By spring no doubt things will be "booming" here once more. Hendsch Bros. have been doing considerable prospecting lately for both gold and copper. Their gold mine is five miles southeast from Copperopolis; ore averages about $23 per ton; width of vein, 14 inches; depth of shaft, 35 feet; tunnel from bottom, 18 feet; walls, slate. This location is called "Lucky Bill." A short distance south they have an excellent copper location, which they call "Idlewild." Width of vein, 4 feet; depth of shaft, 25 feet; slate walls. Three miles southeast from Copperopolis, where they are at present taking some nice copper ore, there is a gigantic mine. It crops out on the surface over 45 feet in width. Can be traced some distance. This location is called the "Opulent." This mine is advantageously situated near the main road to Sonora and Milton, and has an abundance of both wood and water.

PINE LOG MINE.—*Citizen*, Nov. 30: This mine is situated about three miles below Copperopolis, and is known as the Boucher mine. A five-stamp mill has been erected and is kept constantly at work on ore from this mine. They have two shafts sunk on the lead, one to the depth of 160 feet, and the other 60. The lead will average two feet and a half in width, and prospects well. We learn that five more stamps are soon to be added to the mill, which will necessitate the employment of hands.

GARIBALDA.—This mine, owned by L. J. Lewis & Co., has been opened by a tunnel 150 feet in length, crosscutting the vein at 100 feet deep. Vein over 10 feet wide, of ore valued from $10 to $12 per ton. Ore highly sulphureted. Sulphrets assay over $200 per ton. Drift on the vein 90 feet, exposing over 5,000 tons ore to view. The property has a water power sufficient to carry 80 stamps. The vein is opened in several places, and shows ore in great abundance, and all the property now needs to make it very remunerative, is a good and substantial mill.

CONTRA COSTA.

BLACK DIAMOND COAL. A correspondent of the *Gazette*, writes thus: Last winter and spring the company sank the Mount Hope counter slope some 300 feet deeper, so that the present depth from the surface is nearly 1,000 feet. Since the new slope has been in operation the company are shipping the best coal ever shipped from this county, or any other part of the Pacific coast, for steam purposes. The experienced steamboat men of the Sacramento and the San Joaquin rivers say that there is nothing equal to it on the coast, if any superior in the world, for generating steam. It is quick, and as durable as almost any in the market. Last week we had a conversation with the owner of several boats about the merits of different kind of coals for steam purposes. "We have tried different kinds of coal on our boats, but we prefer the Mount Hope coal as better and cheaper for us than any other in the market."

MONO

MONTEZUMA.—*Standard*, Nov. 27: Arrangements have been made to continue the working in the new shaft during the winter. Busy sinking, and the ledge looks finely as progress is made. The ore is said to assay well.

AMEER—Sinking the shaft in favorable-looking ledge matter. Prospects very flattering. The mine is situated in the immediate vicinity of first-class mines. Owners propose soon to incorporate.

QUEEN BEE.—Houses and buildings completed and machinery at work. Everything running well. Shaft will be completed on Wednesday next, when sinking will be resumed until the 250 level is reached. The vein will then be opened up, ore extracted and hoisted to the surface.

ALICE G.—Ledge is three feet in width in the bottom of the shaft. Down 55 feet. Character of ore improving as progress is made. The mine will be placed on the market in a short time. It adjoins the Ida and just east of the Blackhawk.

MONO & CROSS.—The shaft has now been timbered to a depth of 150 feet. The timbering is now below the water line, so that no difficulty is experienced from that source. Since last report the ground has become much harder, the material in the bottom being a mixture of quartz, porphyry and clay.

WEST PACIFIC.—Messrs. Vernou & Goodshaw are still engaged in sinking on the ledge, which increases in width as depth is attained. Work will be continued during the winter months, as all the necessary preparations have been made to carry on successful operations. This mine promises something rich, and is one of the most encouraging prospects in this district.

BODIE CHIEF.—This fine property is owned by a New York city company. Gen. Vernon, the Superintendent, informs us that the mine will be worked all winter. The prospects are exceedingly encouraging for a first-class mine. The shaft (which is 8x5½) is being sunk rapidly, as the rock is not as hard as heretofore. Assays excellent.

CONCORDIA.—New shaft down 49 feet, following the ledge, which is 2½ feet in thickness, pitching east.

THE OTHER MINES.—Water is being baled from the California, preparatory to active work. Preparations for hoisting ore, in the Bulwer. W. A. Skidmore reports a 2½-foot vein in the Rustler, with distinct walls—prospects most encouraging. Rock taken from the bottom of Sitting Bull will work $200 per ton. W. A. Skidmore has been appointed superintendent of the Summit. The ledge in this mine is 3 feet wide, of fair ore. Vigorous work in the Bechtel.

Everything about the South Bodie looks well and promising. Both ledge faces in the Spaulding look well. Shaft and crosscuts of the Blackhawk are advancing. Favorable indications in the South Bulwer. The Dudley shaft is down 228 feet, still sinking. Blue prophyry mixed with quartz in the bottom of the Relief Con. shaft. Republic Con. has indications of near presence of a large ore body. Scarcity of lumber has closed the Orient for a short time. The ore shaft is being enlarged. Syndicate advancing. Mill still busy on Bodie ore. No particular change in the White Cloud. Sinking recommenced on the South Standard. Signs of a rich development in Maybelle. The main shaft of the South Belvidere has reached the depth of 50 feet. The face of Bodie tunnel is in good working ground. Three shafts at work on the Silver Hill tunnel. The Noonday ledge is two feet wide; the dump ore will mill high. In the east drift of the Goodshaw there are strong, well-defined veins of clay, mixed with pebbly quartz which is said to assay well in gold. The Con. Pacific bonanza widens with progress. The Maryland Con. has lately been incorporated by Col. J. C. Dunn. The stopes in the Standard continue to have their usual good appearance. The Bruce and Gildea ledge in the Bodie have run together. The ledge in the face is looking well, and is about four feet wide. The character of the rock in the face of the west crosscut from the north drift of the Red Cloud ledge, in the 250 level, indicate the approach of the Packard & Morton vein. A contract has been let to run 100 feet on the Bullion vein. Arrangements are to be made for developing Weir district at once.

COAL.—The *Standard* speaks thus of the coal "find" 3½ miles south of Bodie: Situated in close proximity to extensive reefs of sandstone were high croppings in the shape of boulders of black conglomerate rock, which on inspection were found to contain lignite of sufficient quantity to warrant further exploration. The substance is capable of producing flame and selected pieces will make gas when pounded up and put into an amateur gas factory, consisting of a clay pipe, the bowl of which is filled and the top covered over with clay to prevent air escaping, then subjected to the heat of a fire when the jet, made from the stem, can be lighted. The appearance of the ground and the croppings found would go to indicate a valuable deposit some where under the surface. We have talked with men who profess to have been raised in the coal regions of Pennsylvania and have made the subject a study, all of whom concur in the opinion that coal must exist where such indications are found. The locators of the property have taken up 320 acres of land under the United States law, governing such cases, and intend to at once commence the sinking of a shaft, following the vein to sufficient depth to demonstrate the presence or absence of a coal body.

PLACER.

OLIVER'S CRUSHER.—*Herald*, Nov. 30: Since he discovered several years ago his fissure of quartz, talc and porphyry below Volcano canyon, on the Middle Fork of the American river, Mr. Allen Oliver has not been idle. The character of the rock being soft, and where it was to be milled being then almost inaccessible to heavy machinery, the process of stamp crushing was deemed too slow and expensive. Under these unfavorable conditions the discoverer set himself to work to devise a new process of crushing, which would be cheap, simple of construction, and expeditious in performing its allotted work. After three years of close study and hard work he has succeeded in inventing and perfecting a new mode of crushing, which is admirably adapted for the purpose intended. It is now at the station awaiting shipment to its destination, and can be seen and inspected by those who wish. The crushing force is horizontal and works on the principle of a rocker. Ordinary crushing capacity, 100 tons in 24 hours, with adjustable weights and levers to increase or decrease reduction, according to power; when we see it at work, may have more to say about it. [This crusher consists of a mortar shaped like the segment of a circle in which a pestle, pivoted above at the center, works backward and forward around the circumference. —EDS.]

SAN BERNARDINO.

COLTON MARBLE.—*Index*, Nov. 29: There is no longer any room for doubt that our neighboring town of Colton has in her immediate vicinity a mine of wealth piled up in the rugged form of Slover mountain. This mountain is a huge mass of stone, which, upon thorough examination by men well versed in the business, proves to be fine marble, of a quality not inferior, if not superior, to the best Italian marble. Recently, however, a new interest has been awakened in this valuable enterprise, and steps have been taken which promise an early development of this industry which has so long been suffered to lie unimproved. A company has recently been organized for the purpose of working this quarry, and arrangements are being made for commencing operations with a full force and improved machinery early in the spring. The Slover mountain marble can be laid down in San Francisco at a cost not exceeding that of the Italian marble, outside of the question of a 20% duty on the latter.

SIERRA.

PLIOCENE.—Downieville *Messenger*, Nov. 30: The Pliocene shaft is down 215 feet, and probably within about six feet of pipe clay. The rock for the last eight or ten feet has been harder, necessitating blasting. The water has decreased to 28 inches. About one foot per day is being made.

EXTENSION.—The B. M. E. Co.'s tunnel is now fairly begun. Most of the outside work is completed and by the time summer comes again the contract of 1,000 feet will probably be about finished. The company has just finished housing in the B. M. Co.'s flume so that it will not be injured by dirt from the tunnel.

ARIZONA.

GLOBE DISTRICT.—*Silver Belt*, Nov. 21: Next week will see 18 stamps pounding away on ore in this district. The Tidwell 3-stamp mill at McMillen will commence operations next Monday, under the management of Fred Medler. The Metamora shaft is nearly 120 feet deep. The vein matter is changing for the better. At this depth the ledge is well-defined and 7 feet wide. The richest ore from the Hannibal mine, is taken from the 100 level. The Lee M. Co. intend to go to work at once to sink a 1000-foot shaft on the mine of that name. Hoisting machinery of the most approved pattern has been ordered. The Miami mill may again be set in motion. The Telfair shaft is 35 feet deep. Another "stringer" of promising quartz has made its appearance near the bottom, its inclination being to the northwest. It is expected that the Haskin mill will soon begin running steadily on Isabella ore. Four teams are now engaged in hauling ore from the mines. The Silver Queen drift has been run into the hill northwesterly of the shaft for 40 feet. Several veins of ore-bearing rock have been cut, one of them three feet thick, assaying satisfactorily. When the drift has been extended some distance further sinking in the shaft will be resumed. The Silver Era mine, the property of Milner & Watson, looks well in both the shaft and the tunnel. The shaft is down 50 feet and the tunnel in 100 feet. The tunnel will be run 60 feet farther, so as to connect with the shaft at a depth of 75 feet. The tunnel is running along the lode, showing good metal the entire distance. The ledge is about three feet between walls, with vein matter the entire width. There are about 125 tons of ore on the dump, which is being assorted so that it will average between $600 and $700 per ton. Recent developments on the Stonewall Jackson lode add largely to the value of that immense property. The main shaft reached the footwall at the depth of 172 feet after having passed through six feet of fine ore. A drift carried 13 feet along the vein at this depth was the whole distance in ore that

Mines and Works of Almaden.—No. 12.

[Translated for the PRESS from "ANNALES DES MINES."]

Mechanical Preparation.

In the actual state of things, all the ore which comes from the mine is charged upon carts drawn hy oxen, and thus conducted to the works of distillatiou, where it is subjected to a rough classification, only in the neighborhood of the furnace for which it is designed. It is divided according to its appearauce into three classes: Superior ore, medium ore, aud poor ore.

The superior ore, called ordinarily metal, takes the name of ciunabar, when it is very rich, aud when of a grain fine enough to be worked; it is then employed for the manufac- of small objects of oruament, as inkstands, paper weights, etc.; from a metallurgical poiut of view it is convenient to make a distiuction for this variety, otherwise quite rare. The *metal* contains, ordinarily, on an average 25% of mercury; it forms nearly 16.14% of the entire mass of the ore which comes in lumps.

The medium ore, called *china* when it is in pieces of 100 to 200 cubic centimeters, aud *requiebro* when it forms larger masses. The conteuts of the china is also very variable. Thcy made of it iu 1869, at the time of the assays of M. Monasterio, of which we shall speak by and by, seven distinct classes, according to its decreasing richuess. The division was made by simple observation, according to the appearance of the ore and its color, varying from red to grayish violet. The final assays have, neverthcless, showu the perfect reliability of this classification; there is ouly a certain experience necessary, which the workmen promptly acquire.

The following are the proportions of the ores of this class wbich are obtaiued:

	Proportion in 100 parts of the Ore of all classes.	Contents in Mercury.
China, 1st c'ass	2.35	25.00
" 2d "	8.03	17.06
" 3d "	7.32	14.66
" 4th "	2.77	8.88
" 5th "	3.93	4.99
" 6th "	4.74	2.46
" 7th "	29.41	1.05

The first class of *china* has then the same contents as the superior ore. If we uuite them we have 18.49% of the eutire ore, which contains 25% of mercury. The division of the *china* in 7 classes, necessary for taking of assays, according to the experience of M. Monasterio, is no longer done to-day. All the classes of *china*, from the second to the seventh, are then reunited and foim about 57.30% of the lump ore, which is designated hy the name *medium ore;* and of wbich the conteuts in mercury is 6.08%.

The poor orc, designated under the name of *solera pobre*, or *solera negra*, is formed of great blocks of black quartzite, presenting only spots of cinnabar; also of tolerably large pieces of schiste, slightly impregnated. It constitutes about 24.21% of the lump ore; its average contents is 0.80% of mercury.

When all the ore which comes from the mine has heen sorted, according to size, into *metal*, *china* or *solera pobre*, there remains the dust and fragments, mixed with a great quantity of stcrile schiste, and debris of differeut natures, such as fragments of brick and of wood. To this residue is given the name of *bacisco;* a screen retains the pieces whose volume passes 40 cubic centimeters; the remaining matter is moistened, and roughly agglomerated in such a way as to form bricks shaped like a truncated pyramid, to which have been improperly given the name of balls of *bacisco*.

The *bacisco*, that is to say, the short, the debris, forms about one-fourth of the coarse ore. As to its coutents, one may say that it has something like an average richness, as it is formed from the debris of pieces of all grades of richness. There is obtaiued from the fragments screened from the fine stuff a little less than a fourth of the latter. In recapitulating, the different classes of ore divide themselves in somewbat the following manner:

Ore.	Contents.	Proportion of the total of Ore.
Metal	25.00%	14.792%
China	6.08%	45.840%
Solera pobre	0.80%	19.368%
Bacisco	"	20.000%

This gives for the whole of the orc a mean contents of 8.30%.

This figure is far from being at all absolute—we do not pretend to give it as an average; they have never made assaya during a period of any length. Also, another assay has given for the contents and proportions of the different classes the followiug figures:

Ore.	Contents.	Proportion.
Metal	21.50%	16.60%
China	7.40%	56.66%
Solera	0.32%	21.50%
Bacisco	7.00%	6.24%

Average contents, 8.15%.

As also they treat iu the works all the ore wbich is taken from the mines, one can easily understand without more explanations that the average contents of the ore should necessarily vary; one may reckon that it contains between 7.50% and 9%.

Important improvements will soon he applied to the classification of the ore at Almaden, which is to-day much too primitive. They have already conuected the mine with the works by an inclined road upon which wagons should descend from above hy weight only; only they have given to the road au insufficient inclination. It is the inteution to supplement this hy establishing upon the inclined plane a system of mechaniral traction hy means of a steam engine placed at its lower extremity. Two small wagons will then he placed upon a track, and will in a few moments traverse the 500 meters. which is accomplished at present hy the heavy and expensive ox teams.

At the foot of the road, the cars will arrive at the upper part of the establishmeut for classification; they will he emptied upon a system of fire grates or screens, placed the one above the other, of which the first two are fixed and the three lower ones are movable, in such a manner as to receive oscillations which will facilitate the fall of the ore.

The largest pieces which remain upon tbe first two grates will he passed to an American crusher, aud then he returned to the screens. All the apparatus will be put in motion by a 15-horse power Corliss engine.

There will he obtained in this manner five classes of ore, according to size. Each of these classes will fall upon a revolving table, or be classed by hand according to its richness. This classification, according to color, can give, with experienced and careful workmen, excellent results; also by reducing to powder ore of a richness of from 10% to 1%, a scale of colors may he obtained, running from bright red to gray or violet, and from this scale may he determined, nearly to a half of a per cent., the contents of a heap of ore, provided, of course, that one can conveniently determiue their assay value.

Excellent results are justly expected from tbis establishment for classification, which will hegin operation when the incliue road is completed. But we must be contented for the present with a sorting somewhat coarser, or with that which we have previously described. Or, in other words, in four description of the treatment of the ore in the works for distillation, we shall consider the ore as separated into metal, china, solera and bacisco.

THIRD PART.

Metallurgy of Mercury at Almaden.

The metallurgical processes actually in use at Almaden were introduced there, tbe one in 1648, the other in 1806. They have been in use until the last few years, without any knowledge of their exact value; it is admitted in Spain and out of Spain, that they are extremcly defective. The loss of mercury was generally estimated at 50% of the whole; a memoir printed iu 1860, by royal authority, estimated it even at 53.40% and 49.82% for the two methods of treatment.

The researches made at Idria with improved apparatus indicated a loss there varying from 27% to 40%. It is not then astonishing that they believed in a still greater loss at Almadcn, with a very simple apparatus for distillation aud an ancient mcthod of treatment, in which they did not eveu take account of the contents of the ore; neglecting, besides, the difference between the nature of the ores of Almadeu and those of Idria, they had concluded to accept, with a sort of passive resignation, the idea of a loss of half or at least a third of the mercury contained in the ore.

They were happily far from the truth. Upon the proposal of a French engineer, M. Pellet, for the introduction of a new furnace, it was decided to make serious and exact assays during the year 1869; these assays were repeated in 1872, and proved, with entire certainty, that the losses attributed to the old processes were absolutely imaginery. It was ascertained that the real loss of mercury, till then estimated by guess, because they had not until then dcter-mined the average contents of the ore, was not greater than six per cent. of the mercury which it contained; in short, that the metallurgy of mercury at Almaden had arrived solely as a result of long practice, and on account of the nature of the ore, at such a condition as could be rightly regarded as very satisfactory.

The publication of these assays, which have led to this remarkable result, would add some interest to the present; it is, however, far from heing complete. The experiments of 1869 are, in effect, the only ones whose details and results have heen made public in a report addressed to the Minister of Finance by M. Jose de Monasterio, aud printed in 1870.

The assays of 1872, under the direction of MM. Luis de la Escosura and Federico Botilla, the former, inspector-general, the second, engineer-in-chief of the mines, have not yet heen made public, and I have not heen able to have access except to their essential results. All the documents which relate to it are in the hands of D. Luis de la Escosura, and they should form an important part of the work which this engineer proposes to publish, upon the metallurgy of mercury, a subject proposed hy the Council of the School of Mines for a competitiou open to all engineers, Spanish or foreign, and to which ia attached a considerable prize.*

Regretting strongly this circumstance, which has deprived us of heiug able to present a series of documents which would be of great interest, we will contcnt ourselves now with the announcement of the most characteristic results.

These results, in any case, deservedly call the attention to the works of Almaden and the methods there employed. We divide this third part into three chapters:

I. Description of the works of Almaden. Of what tbey consist.

II. Treatment of ore in the Bustamente furnace and in the Idria furnace.

III. Losses of mercury; attempts to reduce them.

*At the last moment we learn that the prize has been awarded to M. Luis de la Escosura, July 14th, 1877. We believe that the work has not yet been published.

Relative Cost of Phosphorus and Manganese in Alloys of Copper.

[By Dr. C. ROESSLER, Darmstadt. Translated for the PRESS from BERG-UND HUELLENMAENNISCHE ZEITUNG.

The heneficial effect with regard to the density, consistency, toughness, etc., of copper alloys in general, produced by the addition to them of phosphorous, depends, as is known, chiefly upon the removal of the oxide absorhed during the meeting. This oxide, consisting principally of Cu^2O (red oxide of copper), combines with the phosphorous in such a manner that the metallic copper and phosphate of copper result, appearing upon the surface of the molten metal in the form of an easily fusible slag.

The phosphate of copper contains one atom of Cu^2O (red oxide of copper), and one atom of phosphoric acid. By a simple calculation, it is seen, then, that 0.686 parts of phosphorous are necessary to effect the separation of one part of oxygen.

Phosphorous is introduced into the melted metal in the form of phosphor-copper, a brand of which, containing from 15% to 16% of phosphorus is produced in large quantities by the firm of W. G. Otto, in Darmstadt, and placed upon the market at seven marks per kilogramme, (about 75 cents per pound). This phosphor-copper is of a bright steel gray color, shows upon fracture, a coarse crystalline structure, and is so brittle that it cau he easily rnhbed in the mortar to the finest powder.

Another material, serving a like purpose, is an alloy of maugancse and copper, known by the name of cupromangan. According to E. W. L. Biermaun, in Hanover, this alloy occurs now in the market with 25% of manganese, and at a price of from six to five marks per kilogramme, (from 60 to 50 cents a pound).

The effect of the manganese is similar to that of the phosphorous, though according to Biermann it is more complete and energetic on account of the fact that at the melting point of copper manganese is unaffected, while phosphorous is, on the contrary, in great part, volatilized. Although it must he acknowledged that, on the introductiou of free phosphorous into the melted metal, a not inconsiderahle part of the former volatilizes or hurns way, and so escapes its destination, yet, on the other hand, it is not easy to uuderstand how this can influence the intensity of its effect. But it can be determined by experiment, that in the application of phosphor-copper, or of phosphor-tin, which may he used for the same purpose, a similar loss proves scarcely worthy of notice. It may perhaps he accepted with certainty that the oxide which separates from aud rises to the top of the melted metal after the iutroduction of mangan-copper, is the red oxide of manganese-hausmannite (Mn^3O^4). In this case 2.585 parts of manganese will be required for the separatiou of one part of oxygen. It will be remembered that the same amount of oxygen demands only 0.646 parts of phosphorous, so it is clear that the reduciug power of phosphorous is four times that of manganese. So the expenditure necessary for obtaining a given effect, is—upon the hasis of the above-mentioned prices—nearly twice as great when mangan-copper is used as it is when phosphor-copper is employed.

FRENCH IMITATION BRONZE.—Foreign journals contain accounts of a French inventiou for manufacturing articles in hollow hardened india-ruhher, coppered hy electro metallurgy, so as to imitate bronze, and capable of being gilded, nickeled, silvered, bronzed, or otherwise decorated. They commence hy molding the article of supple india-rubber to the desired form by ordinary means, and after that they harden it completely hy any of the processes usually employed for the purpose. The article so molded and hardened is tben fettled, polished, and even chiseled, if ita natnre allows it; it is then scraped, if needed, so as to give it an even surface, and then coated with black lead or other process, as is ordinarily done in electro-metallurgy, so as to render it a conductor, and consequently able to receive the galvanic deposit. The article is placed in the bath where it is galvanized, and a deposit, of copper or hrass more or less thick is obtained on its whole surface, or even in proceeding by fractions of its surface some parts may be obtained with a red deposit and some with a yellow deposit, according to the nature of the article. It can then be hronzed by the usual processes, and a perfect imitation of the articles in bronze will be thus obtained. It is also ornamented or decorated by any of the ordinary processes of nickling, silvering, gilding, hronzing, and the like. The articles so made have quite the appearance of hronze nickeled, gilded, or ailvered, and they have also the advantage of heing very light and of a very low price. They are strong, and sufficiently elastic to support repeated shocks without being bruised or deuted.

SUIT has been brought in the Fifteenth District Court by the Bank of California against the El Dorado Deep Water Gravel M. Co. to recover $165,046.93 on two promissory notes for $50,000 each, with interest, and a previous iudebteduess of $64,209.36.

R. M. WEEKS iuforms the *Idaho World* that the Black Jack is the richest mine in Owyhee.

ON NOV. 21st an explosiou of gas took place in a Sullivan, Pa., coal mine, killing 13 men.

THE ENGINEER.

The Shape of Tramway Rails.

We read that quite a large hook has been published in England on "tramways; their construction and working," hy D. Kinnear Clark, an English engineer. As of special interest to many of our readers we quote a paragraph concerning the shape of the tramway rail: Iu many of the examples of rails, it may be noted that the sides of the groove are formed with a greater degree of splay inwards than outward, from the wheel than under the wheel. The motive for the greater splay has been, in some instances, to economize metal; but the economy thus affected is simply insignificant. By other designers a low slope has heen adopted, with a view to the more facile extrusion of dried mud and other detritus from the groove by the wedging action of the passing wheel flanges, than is likely to take place when the sides are vertical. There is incurred a much greater resistance to traction, when the groove is occupied by hard deposit than when it is clear; since it is inevitable that the mud and small stones or gravel, which find a lodgment in the groove, mnst be either expelled or trodden upon by the flanges of the wheels. It is a matter of common observation that the resistance is much increased uuder such conditions, and the principal reason is not far to seek: the wheels run at the same time upon two circumferencea of different radii—those of the tread and the flange. Now, a square groove, by its form, resists the expulsion of detritus; and it may happen, and does frequently happen, that the resistance of the car over choked-up grooves is so much increased, that it amounts to as much as that of wheels running on common roads. In the section of the American grooved rails, and particularly Mr. Light's section, it is obvious that the advantage of a widely sloping berme was appreciated by the designera of those sections. The motive of the extremely contracted grooves which have been practiced—some of them not exceeding an inch in width—and which, when clear, provided little more than clearance for wheel flanges, was the fear of the entanglement of the narrow-tyred wheels of cabs and carriages in the grooves. But it is known that the derangement of common road vehicles is almost wholly cansed by the girding of their wheels against the outer sides of the rails, when the surface of the pavement is permitted to sink below the proper level—a oause of disorder with which the groove is not concerned. It is further to be uoted that, by the occasional grounding of the wheel flanges over the bottom of the groove, by the intervention of mud, dust or stones, the metal at that, the weakest point, is heavily stressed. The flanges may also grouud directly on the bottom, where the table of the rail is reduced by wear, when a similar effect may he produced. It is found, in fact, that old thin rails subject to such action are spread laterally, and are occasionally split through the hottom of the groove. The form of the groove, then, is a point of importance, and the best form is that in which the side next the rolling surface is vertical, and the whole of the slope is given to the inner side.

RAISING AN IRON BRIDGE.—A Pennsylvania paper gives an account of raising an iron bridge of the Pennsylvania railroad which spans the Conemaugh at Johnstown. Hydraulic jacks of immense lifting power were used, and slowly but surely the superstructure was raised, span hy span, just 13 inches. The spans were not disconnected at the piers, and the trains which crossed during the forenoon passed along in safety, although the western half of the bridge was so much lower than the eastern section, which had heen taken up to its proper hight. The task was a delicate as well as a difficult one, hut everything moved along like clockwork, and the ponderous weight was at last adjusted to the proper level. The object in making this change of elevation is for the purpose of removing the stringers upon which the raila now rest, and replacing the track on the crossties. It is conteuded hy civil engineers of the road that the bridge is less liable to get out of repair iu the latter case, as there is less danger of lateral motion and of awagging. When the string timbers are taken out, new crose-aleepers of oak will be laid, and on these the rails will he securely spiked. To overcome the difference of the thickness of the stringers, it was necessary to either change the grade approaching the bridge at the east and west ends, or raise the bridge to correspond with the present grade. It was thought best to pursue the latter course, and the work has been satisfactorily carried out. All the bridgea on the division will be changed hy the removal of string timhers from under the rails, the snme as has boen done with the Johnstown hridge.

AN ENGINEERING PLUM.—A Washington diapatch states that Colonel W. Milnor Roberts, late engineer of the Northern Pacific railroad, has heen appointed hy Dom Pedro, Emperor of Brazil, the superintending engineer of efforts about to be made for the improvement of the water-ways of that empire, and that he is to receive a salary of $20,000 per annum for three years, or a compensation at the rate of $25 000 per annum if his services should be required for a less term than three yeara.

Note on Narrow-Gauge Construction.

At the recent Narrow-Gauge Convention, which we mentioned in a late issue, a report of a committee on construction was adopted, from which we quote as follows: The same requirements necessary in the location are necessary in the construction of narrow or broad gauge roads, that is, adaptation to the future traffic and work of the road. If heavy trains are to be run over the road, rail, ties and ballast must be in proportion. If trains are to run at a fast rate, and more stability is required, cross ties must be longer and ballast wider and deeper. If for passenger travel it requires a better finished and wider road bed than for a purely freight traffic, because passengers form their estimate of the safety of a road from the general appearance of it. It is not surprising to your committee that there should be so many of the traveling public averse to riding on narrow-gauge roads when they call to mind these characteristics of some of the roads: No ballast, ties laid down in the mud, joints in all shapes, embankments so narrow that the ties project; cuts not ditched, and almost rubbing the cars; tracks not aligned, etc., the consequence being that the train runs at about eight to ten miles per hour, swinging and swaying like a ship at sea. This is not calculated to soothe the timid passenger, and the worst of it is that, instead of the engineer or contractor getting the blame, the "system" obtains it all.

The location of a narrow-gauge road should be a matter of as much care and require the same engineering ability as the location of a broad-gauge road. Indeed, the location of the narrow-gauge, if anything, requires the most care and attention, as with the change in gauge new problems are introduced, resistance due to curvatures are changed, proportions of paying to dead weight are altered, requiring or admitting of different grades and curves from those in use on broad-gauge roads suited to the same traffic.

THE ST. GOTHARD TUNNEL.—Two years from this time, says the *Iron Age*, the great St Gothard tunnel through the Alps, uniting Switzerland and Italy, must either be completed or the contractor, Mr. Favre, will have a heavy penalty to pay. Under the terms he must pay $1,000 for every day later than October 1st, 1880, on which it remains unfinished. If six months afterward it is still uncompleted he loses $2,000 per day, and if 12 months go past without it being turned over, he forfeits everything, including his bond of $1,600,000. The undertaking is a gigantic one, and some engineers doubt if Favre is not badly beaten at last. The main tunnel is over 29,000 feet long, and the work on it is only prosecuted under tremendous difficulties. All the power used in drilling is furnished by compressed air, which is prepared outside by powerful pumps and stored up in vast tanks. The locomotives which draw from the tunnel the blasted rocks are also run by compressed air, as the use of steam in such a hole would be impossible. As it is, the men at work often suffer excessively from the foul vapors, partly natural and partly produced by the explosions of dynamite, which are so constant that an observer compares them to cannon firing in a battle. These gases would collect and be fatal, except that the exhaust air from the drills is employed to drive them toward the mouth of the excavation. Favre is laboring with splendid energy, and the working force is as large as can be put on. It is vastly to his interest to hurry, for he will receive a bonus of $1,000 for each day previous to October 1st, 1880, on which he has his task finished. The tunnel will cost about $55,000,000, although when it was first undertaken the estimates were some twenty millions less than the above figures.

A GULF PROJECT.—Major Charles Mahon, of the United States Engineers, has been interested with the active management of the survey of the long projected inland water-way along the Gulf coast, from New Orleans to Florida. It is believed that a ship canal across Florida, in connection with such a route, would permit the delivery of western grain on the Atlantic coast without breaking bulk.

NORTHERN PACIFIC.—The heavy traffic on the 140 miles of the Northern Pacific railroad, between Brainerd and Fargo, is already beginning to tell on the iron rails laid down in 1872, and the directors have decided to commence replacing them with steel. An instalment of 500 tons is now being manufactured at Chicago. The pattern adopted weighs 56 pounds per yard, is four and a half inches high, and four inches base.

ECONOMY IN WEALTH.—The French work people are saving, as everyone knows. Guizot gives the following as the cause of the prosperity of the nation: "Habits of prudence have penetrated all classes. There are very few families, even among the lower classes, that spend all their income. A single manufacturer in my town of Sisieux puts by, and has long been doing so, 600,000 francs a year. The wealth of France has at least doubled during 50 years; and, as the population has augmented during that time by only one-teuth, it is obvious that the comfort of the people has increased enormously.

CAPT. WILLIAM IRELAN, of the Ruby Gravel mine, has commenced a tunnel which he expects to run in 1,000 feet by next May.

USEFUL INFORMATION.

Cement by Continuous Burning.

Our cement makers may be interested in an account which we read of a combined arrangement of kilns for burning cement which has lately been devised by an Englishman. His claim is that by keeping the kiln continuously working and utilizing its waste heat he is enabled to economize fuel and labor. For this purpose he arranges two or more flue chambers symmetrically in relation to the kiln in close proximity to it, and forming passages for the hot gases and products of combustion from the kiln to a common chimney, or it may be to separate chimneys. The lower part of each of these chimneys is floored over with removable plates, which are preferable of iron, but which may be tile or other like slabs, the floor forming in each case the cover of the flue through which the hot gases pass. He also roofs over the chamber, and the hot gases after passing through the lower flue may be made to return along the chamber between the floor and the roof, this being a convenient arrangement when it is desired to employ a central chimney or shaft for all the flues. Each of the said flues and flue chambers is provided with suitable valves or dampers, so that the hot gases may be partially or wholly shut off from one and directed into another of them. The kiln being in action its hot gaseous products are directed into one of the flues, the floor over which has been by pumping or otherwise charged with slurry, which thus becomes dried. When this charge is dried the hot products of the kiln are shut off from this flue chamber, and directed into another ready charged with slurry, and while the latter is being dried the dried slurry of the chamber formerly mentioned is stripped and taken to the upper part of the kiln to be burnt; thus in succession the several chambers are charged with slurry, and have their contents dried by the waste heat, then discharged into the kilu which is kept continuously working, the cement burned in it being removed from time to time in quantities taken from the bottom.

PREVENTING RADIATION OF HEAT.—A French journal says that a firm of manufacturers at Boulogne, adopt the following plan to prevent the loss of heat in the steam-pipes, generator domes, machine cylinders, etc., of their workshops. They simply cover the surfaces with sawdust mixed with flour paste. If the paste is very liquid, if the mixture is taken in the form of a stiff dough, and if the surfaces have been well cleaned from grease, the adhesion is perfect and free from cracks. They cover their apparatus with five successive layers of five millimeters each, or a total thickness of 25 millimeters (9·84 inches), which gives them a much better result than 50 millimeters of any of the other materials which are usually employed. The cost is almost nothing; with 50 kilogrammes (110·23 lbs.) of farina at an expense of about 20 fr. ($3 00), they obtain the same result as with 1,000 fr. ($200.00), expended for other materials. The paste is composed of farina, without the addition of starch. The mixture can be applied by a trowel with the greatest facility, either internally or externally. If there is much exposure, two or three coatings of coal-tar render it impermeable to water. If the tubes are of copper, two or three light coats of a hot liquid solution of clay should be first applied, in order to increase the adhesion of the sawdust.

CORROSION IN SOIL PIPES.—The *Canadian Mechanics Magazine* says: Cases of corrosion in lead soil pipes are common in the experience of every plumber. Sections of a drain will be found fairly honeycombed with holes, varying from the size of a pin-head to a quarter of a dollar. They are almost invariably located on the upper side of the pipe, and hence are difficult to detect, as there is no fluid leakage from them. Their origin has been laid to the overuse of disinfectants, particularly carbolic acid, but chemical analysis shows that sewer gas alone is sufficient to cause such corrosion in unventilated lead pipe. Proper ventilation will undoubtedly guard against the evil by carrying off the gas before it can do harm.

TRAIN STOPPAGES IN TEXAS.—The *Railway Age* says: A Texas law requires the conductor of every passenger train "to stop his train at each and every wayside station not less than five minutes," and the court of appeals has just affirmed the constitutionality of the law. Texas legislators evidently are not in favor of fast express trains. It is difficult to see, however, how the State will be benefited by compelling all trains to stand steaming for five minutes at every lonely wood pile and water tank designated as a station, and it certainly will not promote good temper in the impatient traveler.

PAPER FROM WOOD.—The *Iron Age* notes that Mr. Albert Ungerer, of Pforzheim, Germany, has a new method for making paper stock from wood by chemical means. His method consists of putting the ground wood into a vessel in which it is exposed to a gradually increasing steam pressure and correspondingly increasing temperature, and the action of a solution of heated caustic soda, which, though weak only, completely pulps the wood and bleaches it. For pine he uses a 5% to 6% solution and a pressure of six atmospheres as a maximum.

LOSS OF IRON BY RUSTING.—Interesting observations have been made recently on the Cologne Minden road, Prussia, on the rusting of iron rails. A pile of rails of odd lengths were laid on sleepers over a bed of gravel early in 1870, and remained undisturbed until the fall of 1877, there being no use for them. It was then found that they were covered with a layer of rust 12 100 inch thick, which had to be removed by striking the rail with a hammer. The cleaned rail weighed only 398 2-10 pounds, while its original weight was 419 1-10 pounds, showing that five per cent. of the rail had been destroyed by rust, which covered the rail quite uniformly. This confirms the observation often made, that rails stacked away are much more liable to rust than those laid down in a track.

LINING FOR BOILERS.—Mr. Franz Buettgenback gives the following recipe for the preparation of a coating for the inner surface of boilers to prevent the formation of scale. We quote from the *Manufacturer and Builder:* Gradually dissolve 5 pounds of a mixture of 25 parts of colophonium, 2½ parts of graphite, and 2½ parts of lampblack, in 40 pounds of boiling gas tar, adding about one pound of tallow. The solution is diluted with about 50% of the petroleum and applied in a warm state. It has a pungent smell and should be put on rapidly, the precaution of using closed lanterns being necessary. Its effect is to cause the scale to come off in large flakes when picked.

GOOD HEALTH.

Treatment for Intermittent Fever.

Perhaps some of our readers in malarial districts may profit by the following treatment described in the *Sanitarian* by Dr. J. R. Black. He says an orthodox doctor is very apt to treat a chronic intermittent thus: A mercurial cathartic to clean out the abdominal viscera, then quinine in large doses, and if this does not succeed, then in larger and yet larger, to destroy or neutralize the hypothetical malaria in the system. Cases have I seen by the score who had received such treatment for weeks and months unavailingly, who had taken quinine and iron until they were, as they expressed it, almost blind and deaf, and yet the disease persisted, with very brief cessations. As a hygienic therapentist, and as one who has had a large experience with chronic intermittents, I unhesitatingly affirm of this latitude that scarcely a case of intermittent fever need ever become chronic, and that even when so, proper management will hold the symptoms under control until the tendency is wholly overcome. The outline of the method is as follows: Inquire carefully into the history of the case, and whether acclimated or not, directing special attention to each of the abdominal organs, and, if much deranged, administer the best active corrective at once. Then anticipate the next paroxysm with 12 grains of quinine, divided into three doses, beginning its administration 18 hours before the time of the expected chill. Repeat this amount of quinine every seventh day for four consecutive weeks, but at no other time, except when the patient's indiscretion brings on an irregular paroxysm. During the intervals administer daily gentle remedies appropriate to correct the functions that show the most derangement. These remedies should be such as will keep the organs mainly at fault up as near as possible to the standard of healthy action, and no more, never allowing the secretions or excretions of any organ to sink far below the healthy standard, nor causing them to rise much above it. The diet should be strictly hygienic, and so also of the exercise, not permitting the vital energy to be spent in toil that should be devoted to recuperation. To guard against external variations of temperature, especially in the unacclimated, flannel should be worn next the skin. The grand condition of success lies in the method and means for keeping all the abdominal organs during every day, and for several weeks, up to the standard of healthy action, and thus triumphantly raise the health above the ague point. Quinine is invaluable for the arrest of periodicity, but nothing more. By these means my success in treatment has been immediate and invariable, even in those cases in whom improper management had led to serious derangement of the liver.

The Prime of Life.

Between the ages of 45 to 60 a man who has properly regulated himself may be considered in the prime of life. His matured strength of constitution renders him almost impervious to an attack of disease, and experience has given soundness to his judgment. His mind is resolute, firm and equal; all his functions are in the highest order; he assumes mastery over his business; builds up a competence on the foundation he has laid in early manhood, and passes through a period of life attended by many gratifications. Having gone over a year or two over 60 he arrives at a standstill. But athwart this is the viaduct called the turn of life, which, if crossed in safety, leads to the valley of "old age," round which the river winds, and then beyond, without boat or causeway, to effect his passage. The bridge is, however, constructed of fragile material, and it depends how it is trodden whether it bend or break. Gout and apoplexy are also in the vicinity to waylay the traveler, and thrust him from the pass; but let him gird up his loins and provide himself with a fitter staff, and he may trudge on in safety and with perfect composure. To quit metaphor, "the turn of life" is a turn either into a prolonged walk, or into the grave. The system and powers having reached the utmost expansion, now begin either to close like a flower at sunset or break down at once. One injudicious stimulant, a single fatal excitement, may force it beyond its strength, whilst a careful supply of props and the withdrawal of all that tends to force a plant will sustain it in beauty and vigor until night has entirely set in.

DANGER OF FLIES IN THE EAR.—Dr. A. J. Pedlor, of Truckee, Cal., writes to the *Pacific Medical and Surgical Reporter* a description of a case which fortunately is of rare occurrence. He says: On the 11th of June, I was consulted by John R., a stock drover, who complained of excessive pain and violent noise in his left ear. He said, "A fly entered my ear five days ago, but I got it out in *two minutes.*" Ten hours after removing the insect, pain set in and rapidly increased. The old-time remedies of filling the ear with warm water, oil, etc., failed to remove anything, and gave no relief. Inserting a speculum, and illuminating the ear with a Troeltsch mirror, the cause of his suffering was plainly visible. A number of moving worms, or maggots, were seen imbedded in the canel, close to the drum. Careful use of the syringe for ons hour resulted in removing one maggot, about three lines in length. The ear was then filled with carbolized almond oil, containing morphia sulph. A cotten plug being inserted, the patient went to bed. During the night, four more maggots were dislodged, and the following morning I removed the sixth and last one by aid of the syringe. This last one was fully six lines in length. Three came away dead—the effect of the carbolized oil. These wriggling usurpers were evidently hatched from eggs deposited by the "fly," during its brief sojourn in the ear. The drum was intact, though intensely hyperemic. Daily use of astringent drops, and protection from the air, speedily restored the parts to health.

HYGIENIC BISCUITS.—An exchange gives a recipe for making a biscuit which shall accord with advanced hygienic ideas concerning the composition of flour, etc. On a baking board put two pounds of oat meal and two pounds whole wheaten flour, ten ounces of good salt butter, one-half ounce carbonate of soda, one-fourth ounce tartaric acid, and four ounces of sugar. All should be weighed carefully; the butter should be the best that can be procured, and the soda should never be used without the acid. Mix all together. When the butter has been well rubbed into the flour, add buttermilk, mixing with the hand till of a pasty consistency. Knead just as little as possible, to keep the dough light. Roll out; cut with biscuit-stamp to the required size, prick with marker, and fire in a moderately quick oven. In the absence of a stamp cut with a lid; and if no marker is at hand use a common fork. In rolling out the biscuits little or no fresh flour should be used; otherwise the brownish color of the biscuit will be lost. When firing in the oven, biscuit trays should be used. Any wireworker will make one. If these directions are followed, a most palatable, agreeable, and nutritious bread will be produced. If cooled in an open basket, and afterward stored away in tins, these biscuits keep sweet and short for a considerable period.

TREATMENT FOR A SPRAINED ANKLE.—Dr. Erasmus Wilson says: "We all know that there is nothing more painful than a sprain of an ankle; it will lay a man up longer than the fracture of a bone, and he may recover with a very weakened joint. Accompanying a country medical man in his rounds, he told me he had made a great discovery in the treat of sprains. 'The way I cure a sprain,' he said, 'is this: I take some lard; I warm it, and rub it into the sprain half or three quarters of an hour. I then take some cotton wool and wrap around the joint and put on a light bandage. The sprain, which would have taken many months to get well, gets well in a few days—certainly in a few weeks—without any ill effects or after consequences.'" Wilson adds: "I tried this treatment and found that it succeeded admirably."

DAILY BATHS.—As a rule people doing hard physical labor do not bathe as much as they should. The daily bath is to them quite as important as to any class. It requires but a few moments to take it, and when followed by friction it fortifies the skin against colds and rheumatism more than almost anything else can do. A rubber mat which turns up at the edges to catch the water, a couple of quarts of pure water, a common sheet large enough to envelop the whole body, and plenty of friction are all that is necessary. One room in every farm-house should be kept for a bath-room and supplied with heat and these simple conveniences. Proper bathing keeps the muscles supple and lastic.

OZONE IN DISEASE.—Dr. Reiter, in his essay on diphtheria, referring to the rapid rusting of iron in the open air as an indication of the presence of ozone, says: "When I have a patient recovering from a severe illness, on whom organic mischief seems to have been spared, but the recuperative force appears held down by humidity and a clouded sky, my first sight of the rails of our railways reddened with oxide fills me with a hopeful expectation of recovery where life has been trembling in the balance, that has rarely been disappointed."

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Artesian Wells.—No. 8; A Move in the Right Direction; Machine-Shop Rambles; Rogers' Saw, 353. The Week; The Electric Light—Comfort for the Gas Companies; California Academy of Sciences, 360. Improved Variable Automatic Cut-Off; Foundry Notes; Rotary Hydraulic Engine, 361. Patents and Inventions, 364.
ILLUSTRATIONS.—Dingley's Variable Cut-off; 353-61. Rogers' Improved Saw, 353.
MINING SUMMARY from Arizona, California, Colorado, 357-64
MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 356-7.
NEWS IN BRIEF on page 364 and other pages.
CORRESPONDENCE.—Cost of Artesian Wells, 354
MECHANICAL PROGRESS.—The Brake and the Rudder; A New Unicycle; Lighting and Extinguishing Street Lamps; Notes on Car Wheels; Compression in Casting Steel; A Street Car Starter; Life Preserving Bulwarks; A New Signal of Warning for Dangerous Coasts, 355.
SCIENTIFIC PROGRESS.—The Carbou Button; Dredging in the Gulf of Mexico; Gas Turning the Crank for Electricity; At the North; Electricity in Thunder Storms; For the Pole Overland; Life on Mars; A New Metal; The Aztecs in New York, 355.
THE ENGINEER.—The Shape of Tramway Rails; Raising an Iron Bridge; An Engineering Plum, 358
Note on Narrow-Gauge Construction; The St. Gothard Tunnel; A Gulf Project; Northern Pacific, 359.
USEFUL INFORMATION.—Cement by Continuous Burning; Preventing Radiation of Heat; Corrosion in Soil Pipes; Train Stoppages in Texas; Paper from Wood; Loss of Iron by Rusting; Lining for Boilers, 359
GOOD HEALTH.—Treatment for Intermittent Fever; The Prime of Life; Danger of Flies in the Ear; Hygienic Biscuits; Treatment for a Sprained Ankle; Daily Baths; Ozone in Disease, 359.
MISCELLANEOUS.—Gravel Deposit; Hints on Superintending Well-Work; Barriers to the Coast Sands; A Blow at Science, 354. Mines and Works of Almaden.—No. 12; Relative Cost of Phosphorus and Manganese in Alloys of Copper; French Imitation Bronze, 358

NEW ADVERTISEMENTS.

The Week.

Congress has met, and the President's message has been telegraphed throughout the country. The points in it that bear special interest to mining communities relate to the currency. The President advises Congress to leave unchanged the currency laws, and not even meddle with the coinage of silver; in short, "to try a year of rest in financial legislation." The policy of Sherman with regard to silver bullion has excited considerable opposition among sellers. But it seems to us that he has the good of the nation at heart, and that his method will be best. It is, to be sure, a fact that mines have been threatened with stoppage on account of the low price of their product—some have indeed been shut down. But at the present moment it is unfair to condemn a policy, simply because it creates a momentary pressure upon one class of the population. Congress may well turn attention to the defects of the mining law, and can do no harm by discussing again a subject which has been brought before it on a former occasion, viz.: the establishment of a fund for the encouragement of invention, in the direction of the better working of those refractory ores which all over the mining part of the country still continue to defy the metallurgist. We suggest the debate of such questions, as tending to good results, even though the plan of royalties may be unwise in principle.

We call special attention to the account of the Garibaldi Gold mine, of Calaveras county, found in the Mining Summary of this issue.

We return thanks for an invitation just received from Roman & Co., to their Christmas reception, from December 4th to January 1st.

The Electric Light—Comfort for the Gas Companies.

"Who is Mr. Edison?" asks the London *Mining World*, and the question is no doubt echoed by numberless gas-stock holders in both Europe and America. There is a temptation to answer the Europeans, that Mr. Edison is the product of a country whose political institutions are such that her statesmen will not put their hands to the shaft of any triumphal car, and who refuse to ride in any triumphal car drawn by fellow citizens. But however pleased Americans may be over the achievements of their country, there is found on either side the Atlantic not a gas-stockholder who may be consoled, no, not one. And some stronger passion than patriotism, must be called forth to comfort the disconsolate.

There is little satisfaction to be derived by any one from the croak, that the substitution of the electric light for gas, is as yet far from being an accomplished fact. The whole genius of the age in which we live, points to the overthrow of every obstacle to the accomplishment of the plans of Edison and his numerous co-inventors. The electric light is to succeed the gas light. That is a certainty. If the gas companies want comfort, they must find other uses for their product, or discard it altogether, and cast about for the least sacrifice in the way of disposing of their works and immense systems of pipes.

A contemporary has suggested that gas be used now for the purpose of cooking and heating, being delivered as at present from central sources through main and branch pipes. But we think there is a much cheaper and altogether better plan for achieving this very same end. Water is cheaper than coal, and water gas is cheaper than coal gas. Steam will heat and cook as well as gas. Why not use it; and with the same systems of pipes now owned by the gas companies?

This will involve the erection of boilers over the gas retorts, and the covering of these boilers and all the pipes with the most perfect non-conductors of heat. If such non-conductors can be obtained at a sufficiently low rate, the operation of applying them will cost comparatively little. Such cheap and perfect non-conductors being given, the plan to be carried out is as follows. But first, let it be said that the plan is by no means new and untried. It has been successfully tried in Lockport, New York, and is now to be introduced in Springfield Massachusetts.

This is the plan. Large central heaters are established at well-selected points. From them main-pipes lead out all over the city. From the main pipes, smaller, branch and supply pipes are led to wherever the heating or expansive power of the steam is to be used. In short, a complete gas-supply system—only boilers, pipes, everything, must be carefully covered with the non-conductor, to prevent condensation. If a man has a printing press, or a furnace blower, or a pump that he wants to run by steam, he need have no boiler and need build no fires. All that he is required to do is to connect his engine cylinder with the main steam-pipe in the street. The cylinder, too, must be covered with the non-conductor. When the engine is to be started, the steam is turned on. When the engine is to be stopped, the steam is turned off. Not a bit of heat has been wasted, and a meter on the supply-pipe tells the man just how much steam he has used and is to pay for. So in heating buildings. So in cooking. So wherever heat or steam-power is to be used. This is a very convenient arrangement, certainly. And gas companies, that, in the course of a few years, will be no longer great lights, may perhaps find it to their advantage to consider this plan for utilizing their pipes.

The chief object of interest in this connection is, of course, the non-conducting substance. And here is where San Francisco is perhaps to have her share of this gas-question pie. Two gentlemen of this city, Messrs. Hopper & Evans, claim to have invented a compound that combines the requisite cheapness, convenience and non-conducting property. The constituents we will not publish. But that the compound is certainly a non-conductor of the first rank, is proved by a test made in a boiler-making establishment in this city. In the center of a ball three and one-half inches in diameter, composed of this compound, was deposited a piece of ordinary paper. The ball was then placed immediately opposite the blast in a forge. Against the ball and at the side of the blast was rested a bar of wrought iron, four and one-half inches broad by one inch thick. About 100 pounds of best English coal was used in the forge, and a heat was obtained sufficient to melt the bar of iron. The ball was heated for 15 minutes after the iron was melted, and then allowed to cool. Although the surface of the ball had been red-hot, the paper on the inside was found *unscorched.*

Besides possessing this non-conducting property, the compound is said to be easily molded and may be made to take the appearance and polish of marble. Pipes can easily be coated with it. For cooking purposes it is proposed to make stoves of the same material.

However, this question does not hinge upon the success of any one compound. The system of distributing heat and steam power to great distances is already demonstrated to be entirely practicable. It is very cheap and very convenient. Should it not receive more attention than it has?

California Academy of Sciences.

An Exceptionally Interesting Meeting.

On the evening of December 2d the Academy held a regular meeting. Donations to the cabinet were received as follows: Gold quartz in greenstone, assaying $20 per ton, from 300 level of the Bunker Hill mine; slate from the same mine; gold quartz, $20 per ton, from 600 level; iron sulphurets, $50 per ton, from hanging wall in 700 level; black clay slate, in which the above specimens were found; three crystals of iron pyrites, washed out of decomposed slate and worked for gold—from the Hite mine, Fiddletown. All eight of these specimens are from Amador county. Six specimens of gold quartz, $50 per ton, from a true vein in greenstone, in the Niswander mine, near Murphy's, Calaveras county; nine specimens of ozocerite, fossil wax, from the Ozocerite mine, near the railroad, just east of the Nevada line, in Utah. All of these 23 specimens were donated to the Academy by R. H. Stretch.

Mr. J. G. Lemmon presented specimens of a new species of plants, collected by him in Cholame valley, Monterey county, in 1878. The species has been named *Hollisteria lanata*, in honor of Col. Hollister, of Santa Barbara. Other five species were presented.

Mr. John M. Stillman, of the University of California, then read an interesting and instructive paper on

The Relation of Organic to Inorganic Chemistry.

"Just 50 years ago this year marks one of the most important events in the whole history of chemistry, and one which has given the impetus to the most interesting and wonderful discoveries which the science of chemistry has to exhibit.

"As the general subject of organic chemistry is one which is, unfortunately, but little attended to in this country, and its achievements but little known even among the majority of chemists of this country, I have thought that it would be of interest to notice on this 50th anniversary of the first organic synthesis in the true sense of the term, a few of the more important of the *organic syntheses*, and show what immense progress has been made in this direction in the last 50 years.

"Allow me first however to glance briefly at the development of the ideas of organic chemistry. Among the ancient chemists the facts and phenomena of chemistry were so little known, and so utterly uncomprehended, that no attempt to draw a dividing line was made, and indeed none could be drawn, from the existing state of knowledge at the time, between inorganic and organic compounds. During the middle ages the representative chemists of the time were diverted from any pursuit of a systematic science of chemistry, by searching for the philosophers's stone, and the transmutation of the baser metals into gold.

"At a later period, the development of chemistry was entirely directed toward medicinal preparations, and all classification was made on this basis, without regard as to whether the drugs or simples were organic or inorganic.

"Gradually the study of chemistry assumed more and more a scientific aspect, and in 1675 a French chemist, Lomery, first made the division into animal, vegetable and mineral compounds; and this division remained in force until the beginning of the present century, and in 1827 Berzelius first made what seemed to be a thoroughly philosophical and scientific division into organic and inorganic. According to his definition, organic compounds were such as were produced only under the action of *vital force* in plants and animal organisms, or such products as could be obtained from these by chemical processes. This apparently classical definition was accepted universally as a true and scientific distinction between organic and inorganic compounds. In the very next year, however, in 1828, the year which I take this opportunity to commemorate, Prof. Wœhler, of Germany, one of the most celebrated of Germany's chemists, and who is yet living and active at an age of nearly 80 years, overthrew by a simple experiment the beautiful distinction drawn by Berzelius. The compound *Urea*, is essentially a product of organic life or vital-force. It is found only in the animal organism, and chiefly among mammalia, and occurs as an essential constituent of the urine of these animals. It is then, according to Berzelius' distinction, an organic compound.

"Prof. Wœhler found that by heating the cyanite of ammonium it could be changed into urea. Now the cyanite of ammonium was known to be obtained from inorganic constituents, and hence was itself inorganic according to Berzelius.

The wall between the organic and inorganic was thus breached by a bomb-shell in the shape of a solid fact, and from that day to this a rattling fire has been kept up which has reduced the wall to a mass of ruins."

The lecturer proposed to mention some of the more striking examples of the discoveries of organic chemistry, in which the products of nature have been produced by the hands of the chemist. He waived all reference to the immense number of compounds which organic chemistry has prepared which have not been discovered in animal or vegetable organisms, many of which, as the aniline dyes, have given rise to industries valued at millions of dollars. As preliminary he acknowledged that the artificial production of products of vital force is sometimes more expensive than the natural. But this is not always so; besides, in this connection it is to be remembered that there is always a prospect of new methods and new information, giving a cheaper product than nature can produce.

Commencing with the simpler compounds, the lecturer first took up formic acid. This was first obtained by distilling the bodies of ants in water. In the laboratory it can be obtained by the action of carbonic oxide and potassic hydrate, which give formic acid in combination with potassium, which compound, treated with dilute sulphuric acid, gives free formic acid, identical in all properties, physical and chemical, with the formic acid derived from the ants themselves—is in fact the same compound.

The lecturer went on to show how alcohol, acetic acid, glycerine, oil of mustard, alizarine (the coloring material of the madder root), oil of bitter almonds, oil of cinnamon, winter-green oil, camphor (according to Oppenheim), and finally, indigo blue—all of them *organic* compounds according to the definition of Berzelius, may be obtained in the laboratory by the manipulation of purely *inorganic* materials.

"The history of the syntheses in organic chemistry is by no means completed by these few selected examples, they have been selected as representing some of the most familiar and best known of such substances which are *commonly* found only formed by the vital functions of animal and vegetable organisms."

"It will be seen, however, what an immense stride has been made in the progress of chemical synthesis, since the time when Wœhler 50 years ago first broke ground for this new road for chemical activity."

"From this beginning, for as such it can only be considered, it may also be seen what an immense field of activity is open for the future to develop, and what an interesting field is left open for discovery and study in the domain of organic chemistry. It is to be regretted that more opportunities are not furnished in our own country for the study of this branch of chemistry, which in the not distant future will be one of the most practical and profitable as well as the most interesting of all branches of chemical industry."

The Zoological Section.

W. N. Lockington, the President of the Zoological Section of the Academy, delivered an inaugural address in which he advocated the claims of zoology to an honored place among the sciences, and pointed out the necessity of its more exhaustive and systematic study, in order to the prosperity of many of our most important industries on this coast. The destroyers of our wharves and shipping, the despoilers of our fisheries, the deadly enemies to our vines and trees, demand and *must have* more attention.

At the conclusion of Mr. Lockington's remarks, the Hon. Alex. Del Mar delivered an address on the subject of

Insanity and Crime in Mining Countries.

The question treated is a novel one, and the paper furnishes an important addition to the works of social science, though it may in some points challenge debate. It being impossible, in the short space of a report, to give the paper merited notice, we will present it in full in the next issue of the Press. The paper aroused some little discussion, in which several gentlemen who can remember experiences of the early days of California, took part. Among them was B. B. Redding, who was in the placer mines from '50 to '53. He objected to the unhappy picture which had been presented of the condition of the miners. In his experience he had seen no insanity among the miners, and no suffering from destitution. Prices were high, to be sure. An onion was sometimes sold for a dollar. But as a general thing labor was in demand, the wages averaging $7.50 a day. If a miner was not satisfied with his wages, he could go and pan out for himself. If his independent venture did not succeed, he could return and get good wages. There was a good deal of sickness, but the sick ones were carefully taken care of. There was no stealing. There was no insanity. Food was plenty and work was plenty.

Here Mr. Del Mar pulled the *argumentum ad hominem* upon Mr. Redding by reminding him that he himself had stated that an onion cost a dollar; but retired on Mr. Redding's intimating that the miners did not attempt to live on onions. The meeting adjourned.

Judson Powder.—On last Friday a blast of 25,200 pounds of Judson powder was exploded in the Dardanellee Consolidated mining claim, at Forest Hill, Placer county. The Nevada *Transcript* describes the blast and its effect: "It was in three different drifts and 12 chambers, the powder line being 85 feet back of the face of the bank. The bank was about 200 feet high. The force of the explosion moved the entire mass, and so pulverized and threw it that a person can now walk directly over the face of it in any direction. A careful survey shows that 13 cubic yards of dirt was broken to each pound of powder used." On Saturday another blast of the same powder was fired in the Big Bonanza gravel mine, at Gold Run. According to the same authority, 17,500 pounds was used, and 166,000 cubic yards of dirt put in readiness for washing.

The steamer *Cocopah* brought into Yuma from Ehrenberg on the 28th, ult., 45 bars of base bullion and 25 tons of galena ore.

Improved Variable Automatic Cut-Off.

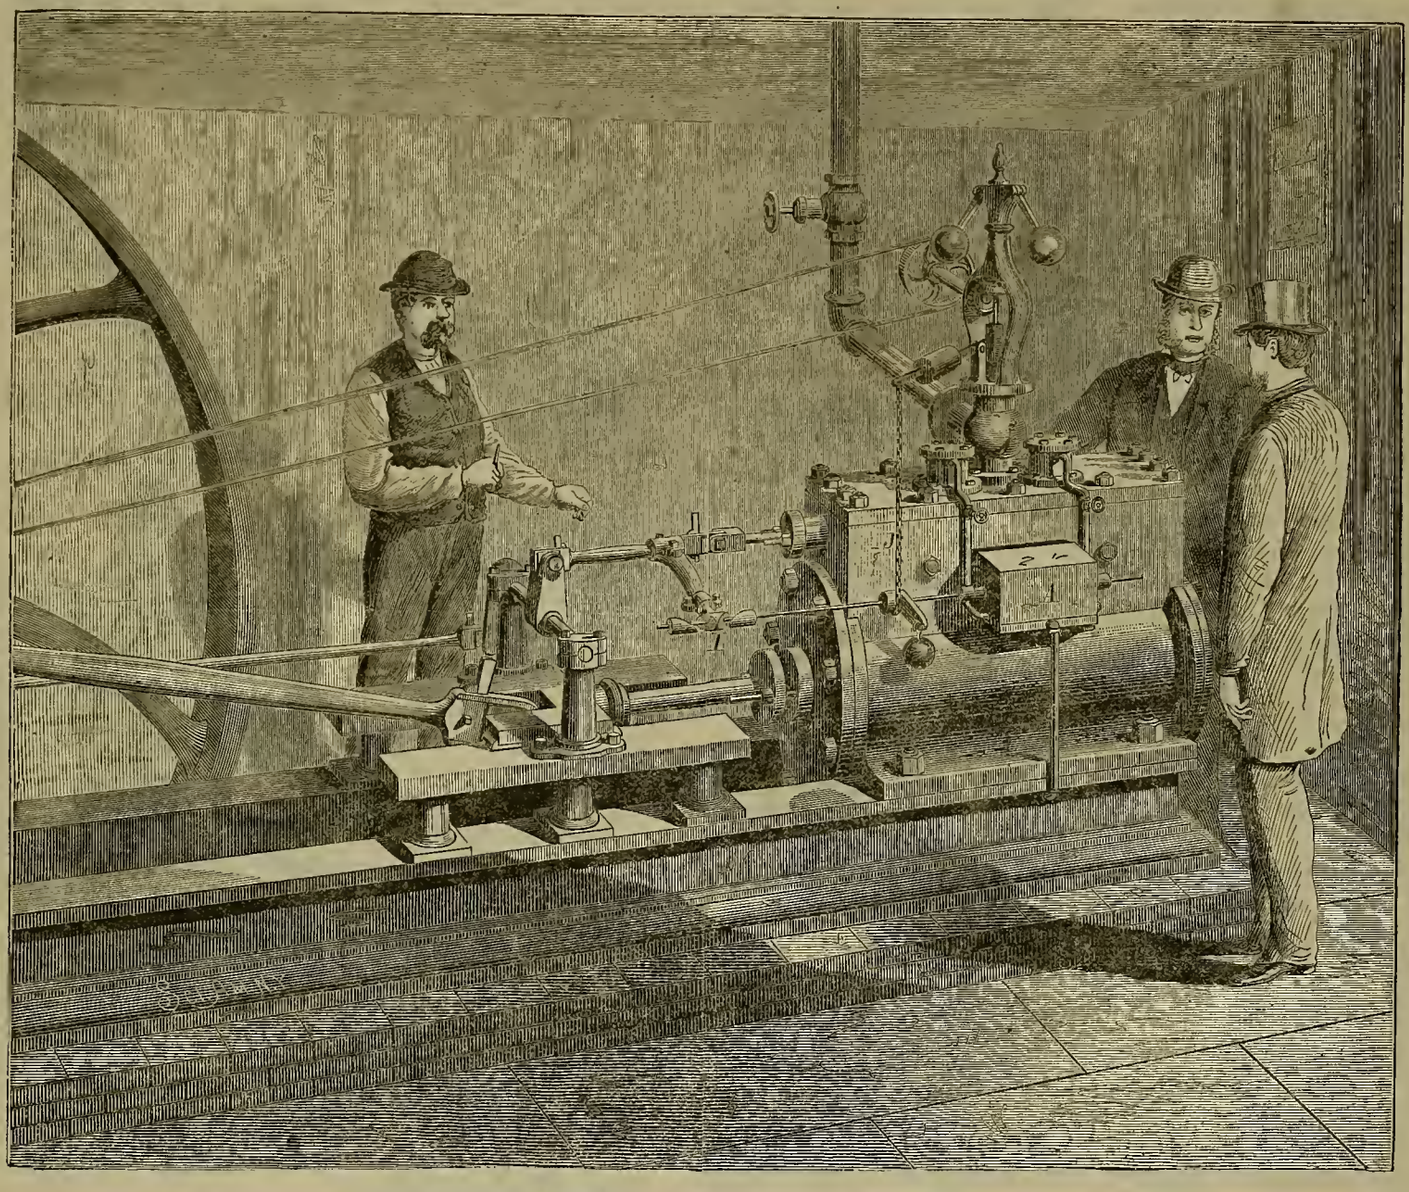
In the device herewith illustrated the inventor has aimed to provide a variable automatic cut-off gear which may be applied to plain slide valve engines, and render the working of the same fully as economical as if they had been specially constructed in connection with an improved apparatus of the kind.

A general view of the apparatus is given in Fig. 1, and the details will be understood from Figs. 2 and 3, (see first page). It is so constructed that should the motion of the engine become too rapid, it will cut off the steam automatically at each stroke of the piston until the engine has been slowed down to the proper speed. Beside the valve chest is a secondary chest, *A*, Fig. 3, in which is the valve, *B*. This chest has an exhaust port, *C*, and ports, *D*, leading to the cylinders, *E*, attached to the top of the main valve chest. The chest, *A*, is connected to the main chest by a passage, so that the pressure may always be the same in both chests. In the cylinders, *E*, are spiral springs which rest upon steam-tight pistons, to which are attached rods which pass down into the main valve chest and are attached to elbow levers, *F*. The holes in the chest through which the rods pass are made larger than the rods, so that the steam may have free passage. The elbow levers communicate, as shown, with plates, *G*, placed on top of the slide valves. These plates have ports through which the steam passes in its traverse through the ports of the slide valve to the main cylinder ports. When the engine is running at ordinary speed the plates, *G*, are in such a position that their ports may be directly over the main ports. To the valve stem, *H*, is attached an arm which carries a wedge-shaped head, *I* (see Fig. 1), and through this passes the valve steam from the secondary chest. On the last mentioned stem are adjustable collars, and also connected to the stem is a chain, *J*, which carries a weight, and which, after making one or two turns around the stem, communicates with a lever which is connected with the governor.

With this construction, as the speed of the engine increases, the outward movement of the governor balls causes the lever to be depressed and the valve stem to be turned, so that the head on the arm will strike the collars on the stem and thus move the valve, *B*, on its seat. As this valve moves it connects one of the ports, *D*, with the exhaust, *C*, so that steam may escape from the upper part of the cylinder, *E*, with which said port is connected. This allows the steam pressure of the main valve chest to raise the piston in said cylinder, *E*, and hence to move the plate, *G*, with a positive motion to shut off steam. This happens at each stroke of the main piston until the speed of the engine has been reduced to its ordinary amount.

The cost of attaching is small, comparatively, as all of the old parts of the engine are utilized, except the old slide valves and governor valve, which are laid aside.

We give indicator diagrams from an engine fitted with this cut-off, in Fig. 4, (see first page). The valve has been for nearly a year in successful operation in New York. The inventor, Mr. E. R. Dingley, may be addressed at 112 Wooster street, New York, for further particulars.



DINGLEY'S PATENT VARIABLE AUTOMATIC CUT-OFF.

The Bodie Fire Engine.—The Bodieites have made a formal trial of the Babcock engine, of which we had occasion to speak a few weeks ago. The engine was run about 1,000 feet, the hose run out and the fire extinguished, all in the space of five minutes. Only one cylinder of the engine was used. The fire was in a pile of dry-goods boxes, prepared for the occasion by saturation with kerosene. The citizens are suited with the Babcock. The engine was purchased from Messrs. Parke & Lacy, 417 Market street, S. F.

The Acting Commissioner of the General Land Office has rendered a decision in the case of the San Andreas M. Co. vs Adam Lanig, ordering that the agricultural entry and undelivered patent of Lanig be held for cancellation.

Breathitt county, Ky., is in a complete state of anarchy, the county seat being in possession of desperadoes, and several persons having been killed and wounded.

Foundry Notes.

Work at the foundries is not particularly brisk at present, this being usually one of the dullest months of the year in this line of business. All the shops, of course, have a certain amount of work on hand, but most of the smaller ones are rather slack.

The Fulton Iron Works

Yet continue busy, having still as much work as at any time during the summer, and are employing about 160 men. They are building a ten-stamp mill for the Tombstone Mining Co., Tombstone district, Arizona, and with it go four 5-foot combination pans, two 9-foot settlers, retorts, clean-up pans, etc. This machinery is to be run by a 25-inch American turbine wheel. They are also building a mill for the McMillan mine, Arizona, with two 5-ft. combination pans, a 9-ft. settler, clean-up pans, retorts and complete outfit. A 12x24 engine, and 48-inch by 16 ft. boiler accompanies this order. Quite a number of boilers are being built in the boiler shops belonging to the works. The largest among them is for a new freight steamer for the South Pacific Coast R. R. Co.—the narrow-gauge Dumbarton route. This boiler is similar to that in the steamer *Newark*, belonging to the same company. The boat is to run between this city and the slips in Oakland creek. The boiler is 11 feet in diameter, 25 feet long, and weighs about 50 tons. They are making a lot of heavy shafting, water-wheels, etc., for the Merrifield mine, Nevada county, and doing considerable mining and general work.

At the Pacific Iron Works

The largest work on hand is the outfit for a mill of 20 stamps capacity for the Gunsight mine, Resting Springs district, California. This outfit consists of engine, boilers, pans, settlers, etc., complete. The crushing machinery will consist of the newly invented Davis pulverizers, a rotary pulverizer consisting of a central disk on which are the shoes, revolving in a case containing peculiarly-shaped dies. They are also building a five-stamp mill for the Hanover mine, Calaveras county, and a large boiler and lot of sugar machinery for a Honolulu firm. They have recently completed several Howell-White furnaces, one of them for the Highbridge mine, Belmont, Nev. They are at work on two more, one of them for the Mary Bean mine, Arizona, and the other for the Montezuma mine, Nevada. They recently shipped a 60-ton melting furnace to the Richmond Consolidated mine, Eureka, Nevada; and a lot of machinery to the Park mine, Park district, Utah, the latter being mostly repair work on the mill. The works are also engaged on considerable repair and small general work.

Rotary Hydraulic Engine.—We were shown this week by the inventor, Mr. R. J. Cartmel, of Santa Rosa, a model of a rotary hydraulic engine. The cylinder is arranged in the segment of a circle and is made square interually. On the periphery of a wheel are arranged the wedge-shaped wickets or pistons which travel through the cylinder. Water is admitted to one end of the cylinder under pressure, and as the pistons enter the cylinder, each one opens the double valves which close with a spring behind them. The valves are made double and independent, so as to ensure against leakage as the pistons enter the cylinder. As the pistons emerge from the end of the cylinder the waste water is led off in a sluice. On the shaft of the central wheel in which the pistons are secured, is a spur, which is geared down so as to furnish the requisite speed to a driving wheel. The inventor claims that this wheel will work up to 95%. It is intended for running any kind of machinery, large or small, and is compact and neat in appearance.

We call attention to the differential pumping engines, for mining, town water supply, irrigation, etc., advertised in this issue by the Risdon Iron and Locomotive Works.

It is reported that the controlling interest in the Niagara mine has been sold to a New York company, and that the papers were sent East last Thursday.

The Sherman mine, Globe district, Arizona is developing unusually rich ore.

Spenceville and her copper mine are developing.

FOREIGN PATENTS

FOR PACIFIC STATES INVENTORS

ARE SECURED IN MUCH LESS TIME,

—BY—

DEWEY & CO.,

AT THE OFFICE OF THE

Mining and Scientific Press,

THAN THROUGH ANY OTHER AGENCY.

Established in 1860.

THIS FIRM CAN BE RELIED UPON

—AS—

Honest, Competent, Permanent,

ALL OF WHICH POINTS ARE IMPERATIVELY REQUISITE IN ATTORNEYS, FOR THE INTERESTS OF THEIR APPLICANTS FOR PATENTS IN DISTANT LANDS.

Our Associates and Correspondents are the Best Practitioners in every country where Patents are granted.

For Foreign Patents no model is required, as a rule, except in Canada. The Specifications and Drawings of the American Patent, if complete and perfect, will suffice for us to prepare the case. In Great Britain and other countries we apply for patents in the inventors' own names, thus avoiding their being published to the world in the name of a foreign agent, as is usual through other and less painstaking agencies.

Frequently several inventions, covered by different patents in the United States, on the same subject, can be skillfully combined in one patent in foreign countries, when well understood by intelligent attorneys.

As the privileges of our inventors are cut off in *some* countries, and curtailed in others, if not applied for soon after the issue of the U. S. patent, we advise inventors whose patents will be valuable in various populous civilized countries, to lose no time in applying for patents whenever they intend to obtain them for themselves or the benefit of others—with their own means or through the resources of those who are permitted to share the benefits. It must be remembered that the English (and some other important nations) invite the early introduction of inventions into their realms, by offering patents to the first *introducer* (which means the first *applicant*), without regard to the rights of the *actual* inventor, who has no after recourse.

For important inventions it is best to apply for foreign patents at the time of application for or before the issue of the U. S. patent.

Term of Patents in Foreign Countries

COUNTRIES.	PERIOD OF YEARS GRANTED, ETC.
Australian Colonies:	
Victoria	14 years in successive periods, 3, 4 & 7 yrs
Tasmania	14 years in successive periods, 3, 4 & 7 yrs.
New South Wales	7 to 14 years.
Queensland	7 to 14 years.
New Zealand	Full term, 14 years.
Austria	15 years, by annuities
Argentine Republic	25 years or more, determined by govt
Belgium	20 years by annuities.
Brazil	5 to 20 years.
Canada, (including British Columbia)	14 years.
Chile	25 years or more, determined by govt.
Cuba	5, 10 and 15 years.
Denmark	5 to 20 years, at the option of governm't.
England	14 years, in successive periods, 3, 4 & 7 yrs.
France	15 years, by annuities.
German Empire	15 years.
Italy	12 years, by annuities.
India	14 years, 5 copies, specification required.
Mexico	Full term, 10 years.
Norway	6 to 10 years at the option of gov'm't.
Portugal	Importation 5, Invention 15 years
Peru	25 years or more, determined by govt.
Russia	Importation 1 to 6 yrs, Invention, 3, 5, 10 yrs.
Spain	Importation, 5 yrs, Invention 5, 10, 15 yrs.
Sweden	3 to 5 yrs, at the option of government

We have the Foreign Patent Laws, Foreign Patent Reports, and other valuable and assisting documents, for ready reference in our MINING AND SCIENTIFIC PRESS Patent Agency Library—the most complete Patent Library on this side of the Continent.

The cost of patents in any one or more of the above countries will be furnished on application to us.

Any further information regarding the time within which patents must be worked in any foreign country, time of payment and amount of annuities for patents in any of the above countries, will be cheerfully given on application.

Full particulars regarding any countries not named above, will also be given when desired.

DEWEY & CO., Patent Agents,

Publishers of the MINING AND SCIENTIFIC PRESS and the PACIFIC RURAL PRESS, San Francisco.

ABOUT SECURING U. S. COPYRIGHTS, TRADEMARKS, LABELS, Etc.

[Under the Revised Act of Congress, which took effect August 1st, 1874.]

No copyright is valid unless notice is given by inserting in every copy published, on the title page or the page following, if it be a book; or, if a map, chart, musical composition, print, cut, engraving, photograph, painting, drawing, chromo, statue, statuary, or model or design intended to be perfected as a work of the fine arts, by inscribing upon some portion thereof, or on the substance on which the same is mounted, the following words, viz.: "*Entered according to the act of Congress, in the year ——, by ——, in the office of the Librarian of Congress, at Washington;*" or, at the option of the person entering the copyright, the words: "*Copyright, 18—— by ——.*"

The law imposes a penalty of $100 upon any person who has not obtained copyright who shall insert the notice "*Entered according to act of Congress,*" or "*Copyright,*" etc., or words of the same import, in or upon any book or other article.

Each copyright secures the exclusive right of publishing the book or article copyrighted for the term of 28 years. Six months before the end of that time, the author of designer, or his widow or children, may secure a renewal for the further term of 14 years, making 42 years in all. Applications for renewal must be accompanied by explicit statement of ownership, in the case of the author, or of relationship, in the case of his heirs, and must state definitely the date and place of entry of the original copyright.

[Our terms for securing a copyright certificate is $5, including the Government fee.]

[Our terms for securing certificate of registration for a label is $16, including Government fee.]

Copyrights cannot be granted upon trademarks, nor upon labels intended to be used with any article of manufacture. If protection for such prints or labels is desired, application must be made to the Patent Office, where they are registered at a fee of $6 for labels and $25 for trademarks.

Applicants for the registration of trademarks must file the following papers in the Patent office, to wit:

1. A specification fully describing the trademark.
2. A petition by the party or firm
3. An oath by some member of the firm, if it be a firm; otherwise by the owner.

[Our terms for securing the registration of a trademark (issued in the form of a patent) is $40, including Government fees.]

If you have a label which you desire to protect against imitation, you can have this done by complying with the following rules, viz.:

1. Send us six copies of the label, and full name of proprietor.
2. State the class of goods to be protected, and give a brief description of your business.

For further information concerning the above, U. S. and Foreign Patents, caveats and general patent soliciting business, address

DEWEY & CO., S. F.

Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

Instructions of the U. S. Land Commissioners—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emptions; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissions; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

Abstract from the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Amendatory Act Concerning Timber; Miscellaneous Provisions Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 50 cts.

Published and sold by DEWEY & CO., S.F

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the hights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, $7.50. Postage, 50 cents extra

Barlow J. Smith, M.D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervo-vital derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHEAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural length of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

FRED. M. PATRICK, Manager.

Important to Contractors

— AND —

SUBMARINE BUILDERS.

WILLIAM STACK, of Oakland, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an apparatus for driving nails or spikes under water, an engraving of which is here shown. It is well-known that it is extremely difficult to drive nails or spikes under water, even if it is only submerged a few inches. These difficulties are completely obviated by Mr. Stack's device, which has been put in thorough practical operation in the construction of harves and ps in the Oakland side of the ty.

Fig. 1 shows he application t the device, nd Fig. 2 shows he construction. A is a metal tube of suitable length, the foot of which may be serrated as shown, so that the points will engage with the wood when the tube is pushed or driven against it. The rod or driver, C, has a recess or cavity, D, at the lower end so as to rest on top of the nail or spike shown in Fig. 2. Where the tube, A, is pushed against the timber in the desired position, the spike or nail is dropped in at the upper end and slides down against the timber. The rod, C, is then slid down on top of the nail, and by alternately drawing out and forcing the rod into the tube, the rod serves as a driver; or by hammering on the upper end of the rod the nail is driven into the wood. The tube answers both as a guide for the nail and driving rod. The tube can also answer as a guide for a screw-driving device on the end of the rod, by which lag screws may be put in place under water as well as nails. Of course the tube may be set in any position desired, so that nails may be driven at an angle if necessary. The appliance, as simple as it is, will be found very useful in many cases for bridge building or similar purposes. Address,

WM. STACK,

N. E Cor. Fifth and Harrison Sts., OAKLAND, Alameda County, California.

HEMORRHOIDS OR PILES,

A treatise on their scientific treatment and radical cure, by E. J. FRAZER, M. D., San Francisco. Price, 25 cents; for sale at the bookstores and by the author at 221 Powell street. Sent by mail to any address on receipt of the price in coin, currency or postage stamps.

Machinery.

The Ingersoll Rock Drill.

The lightest, most easily adjusted, and only Drill using rubber buffers to protect cylinder-heads, and with Automatic Feed.

Some of the mines using this Drill on the Comstock Lode, Virginia City, Nevada:

Best & Belcher M. Co., Crown Point M. Co., Belcher M. Co., Yellow Jacket M. Co., Sierra Nevada M. Co., Silver Hill M. Co., Sutro Tunnel Co. Gould & Curry M. Co., Con. Virginia M. Co., California M. Co., C. & C. Shaft, Utah M. Co., Ophir M. Co., Mexican M. Co., Overman M. Co.,

REYNOLDS, RIX & CO., Agents.
18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

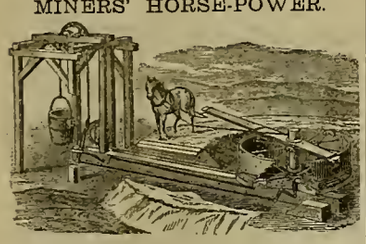
The Only SAFE BOILER. SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or hulling material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,
North Bloomfield, Nevada Co., Cal., October 1st, 1878.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

DEWEY & CO.,
Publishers, No. 202 Sansome street, San Francisco.

BELTING AND LACING.

MANUFACTURED BY

H. ROYER,

Continued from page 357.

averaged $1,040 per ton. The bottom, sides and top of this drift shows ore of the same grade. Both walls of the great lode have been found. They are 114 feet apart, are smooth, solid and coated with clay. At one point the ore and vein matter on the footwall was 30 feet thick and on the hanging-wall 9 feet. A "horse" 75 feet in thickness appeared here, but in drifting 150 feet along it, it narrowed down to a point, and in the opposite direction this is also found to be the case. A 5-stamp mill, with engine power for 10 stamps, has been ordered for the company from San Francisco.

ITEMS.—The *Miner* hears that the Hon. C. C. Bean has succeeded in obtaining in San Francisco, a roaster for the Aztlan mill, which will enable him to work the rebellious ores of the Hassayampa district, of which there are tens of thousands of tons ready to be extracted from the mines, and are only waiting appliances to enable the mill to work the ore successfully. The Perry alone is ready and eager to supply all the stamps in the district with high-grade ore, the only difficulty being the want of a roaster to enable amalgamators to separate the silver from the base. The Tiger mine, says the *Enterprise*, is in a very healthy condition. It is now opened, by shaft and winze, to a depth of 300 feet from the bottom of a deep gulch. The Oro Bonito people are pushing the erection of their mill and the development of their mine.

NEW MINES.—Grant County (New Mexico) *Herald*, Nov. 23: John Swisshelm, who returned lately from the Whitewater basin, in the Swisshelm mountains, Arizona, gives a most favorable account of the new mines in that vicinity. He says that four of the mines are now being worked with splendid results. The first of these is the Mountain Queen, which is being opened by a tunnel running across the vein. It has been run in about 40 feet, and the west wall rock of the vein was struck about 20 feet from the mouth. The balance of the work has been carried on through metal, of which some 80 tons have been extracted. The eastern wall rock has not yet been reached, although the character of the ore has changed from gray and black carbonates of silver to a red oxide. The average assay of the ore is 112 ounces. This mine is owned by Henry Henson, John Swisshelm and J. W. Fleming. The second mine in importance is the Whale, situated about half a mile northeast of the Mountain Queen. A shaft four by eight feet and 12 feet deep has been sunk entirely on the vein, the wall rock not being touched upon either side. Thirty-five tons of ore, assaying from 174 to 430 ounces to the ton, have been taken out. It is a red carbonate, and steadily improves in quality with increase of depth. The Mammoth, an extension of the Whale, belongs to Martin Smith, of San Francisco, and George W. Myers. The vein is opened up along about 400 feet of its length and some 40 tons of ore have been taken out. It shows both horn and metallic silver, and although no assay has yet been made, experts who have examined the rock are unanimous in pronouncing it very rich—some estimates even running into the thousands. The fourth mine, the Mountain Chief, is being worked by James Bullard and Adam Clark. The vein, which is four feet wide, runs parallel with the Mountain Queen, about 500 feet to the east, and shows the same class of ore as the latter. The shaft had reached a depth of 10 feet, when Mr. Swisshelm left, and some 30 tons of fine-looking ore had been taken out. No assay has yet been made. There are numerous other locations in the immediate vicinity, and a regular district will soon be organized. Wood, water and grass are abundant for miles around. The mines are situated about 12 miles west of Camp Supply, and some 30 miles south of Bowie.

COLORADO.

LEADVILLE.—*Reveille*, Nov. 16: The Agassiz mine is yielding 12 to 14 tons of ore per 24 hours, with two men on each shift breaking mineral. As in other mines where the deposit is thick, but very little development is shown for the amount of production. The workings consist of an incline 45 feet long from the bottom of No. 1 shaft, on ore 7 feet high. At the lower end of this incline a room 12 feet wide has been sloped out, and an 80-foot shaft from the surface connects with it. From this point another incline has been run 30 feet, and stoped out 12 to 15 feet in width. This is all the mining that has been done to prove this a first-class property.

FRENCHMAN.—This mine, adjoining the Adelaide on the west, at a depth of 230, discloses a body of 6 feet of soft carbonates, from which select specimens returned an assay of 100 ounces in silver.

KENOSHA AND OCEAN WAVE.—The developments by shafts and tunnels on these claims of A. T. Hathaway's, aggregate 300 feet upon ore 2, 3 and 4 feet in thickness, running 154 ounces per ton.

CLIMAX.—A rich body of mineral two feet thick has just been disclosed in the Climax mine on Fryer Hill. Mr. Witherell, of Berdell & Witherell, has taken the first load to their smelting works for treatment. The ore will probably run 200 ounces of silver to the ton.

DUNKIN.—The Dunkin is yielding heavy masses of low grade ore, and small quantities of exceedingly high grade. An assay lately returned 600 ounces, and selected specimens can be found on the dump which will assay 3,000 ounces.

A New Milling Machine.

We have had an opportunity to examine a new invention in mining machinery, devised by Mr. Ezra Colemsn of this city.

Combined Amalgamator and Settler.

This consists of a pan similar to the ordinary amalgamating pan, but much deeper, so as to allow of the working of a large charge, and to facilitate settling. The cone, muller and the screws for raising and lowering the upper plate and shoes present no new features. The novelty is in the upper plate and shoes. The upper plate of the smalgamators generally in use, is perforated by rectaugular holes which extend neither to the center nor to the circumference of the plate. Through these holes the pulp passes to be grouud between the upper plate and the bottom of the pan. But owing to the position of the holes, the pulp is not distributed over the whole bottom, but only in a ring midway between the center and circumference. The result is that the shoes attached to the under side of the upper plate wear unevenly and soon have to be replaced. In Mr. Coleman's machine the holes or slots are cut from the circumference in half way to the center, and alternate with other slots cut from the center out half way to the circumference. By this means the pulp is distributed evenly over the bottom of the pan and it is claimed that the shoes will wear so evenly that they need not be replaced until they are all together worn down very thin. Another advantage, arising from the fact that the whole bottom is available for grinding, instead of only a part of it, is that more pulp may be operated upon at once. Moreover, so much metal is cut from the upper plate that it is comparatively light—a great advantage where saving in freight and labor is an object.

This pan is to be used also as a settler. During settling the velocity of the plate should not be so great as when amalgamating. By an ingenious arrangement of gear below the pan, Mr. Coleman is able to increase or decrease the velocity of the plates without altering the velicity of the pulley over which passes the belt that runs the whole machine. And this is accomplished by simply a short, easy movement of a lever which extends from under the pan.

The Martin White Case.

[Continued from last week.]

Corner Posts not Absolutely Necessary.

So far we agree entirely with the views of counsel for appellant; but, although we are satisfied that a location must be of a surface claim, and that the boundaries and extent of the claim must be plainly defined by stakes or marks on the ground, it does not appear to be a necessary consequence that the least admissible marking is by posts or monuments at all the corners of the claim.

We are aware that the Commissioner of the Land Office has recommended the planting of posts at the corners and the erection of a sign-board with the name of the claim, the names of the locators, etc., at the location point, and undoubtedly a compliance with these recommendations would be sufficient to satisfy the law in this particular. But at the same time we think it may be satisfied by something less. There is, after all, something in the fact that it is a mining claim and not an agricultural claim that is being located, and some account should be taken of the customs, habits and circumstances of a mining community in determining what is a sufficient marking of a mining claim.

The Vein the Principal Object.

The vein is always the principal object that the locator has in view; it is generally, after location and work at the location point, a conspicuous feature of the locality: it is the first thing that attracts the attention of mining men; the surface claim by which it is to be located ought to conform to its course; the end lines must be parallel, and, as they ought to conform to the dip of the ledge as nearly as practicable, they ought to be at right angles to the side lines, so that if the center line of the claim is once established the boundaries are thereby fixed and may be readily traced.

The Object of the Law

In requiring the location to be marked on the ground is to fix the claim—to prevent floating or swinging—so that those who in good faith are looking for unoccupied ground in the vicinity of previous locations may be enabled to ascertain exactly what has been appropriated in order to make their locations upon the residue. We concede that the provisions of the law designed for the attainment of this object are most important and beneficent, and that they ought not to be frittered away by construction. But it must be remembered that the law does not in express terms require the boundaries to be marked. It requires the location to be so marked that its boundaries can be easily traced. Stakes at the corners do not mark the boundaries; they are only a means by which the boundaries may be traced. Why not, then, allow the same efficacy to

THREE medals were awarded to California wine manufacturers at the recent American Institute fair in New York.

ONE of the *Pomerania's* boats has been secured, with a bag containing $25,000.

A NEW 10-stamp mill, built in Cincinnati, is now on the way to the Tombstone district.

THE Andrews brothers, who crossed the Atlantic in a dory, intend to perform the same feat on the Pacific.

SECRETARY SCHURZ has written a severe and caustic reply to the recent letters of Generals Sherman and Sheridan.

TRADE dollars are now being imported from China to New York at a profit of six cents on each to the importers.

What Women Can Do.

Our attention has been called to a new article for the use of ladies, the invention of which has conferred an everlasting blessing upon every lady. We refer to the Queen City Skirt Suspenders, for supporting ladies' skirts, the most desirable and beneficial article ever invented for the relief of women, many of whom have suffered years of miserable health caused solely by carrying the weight of a number of heavy skirts, completely dragging them down. Something to support ladies' clothing is absolutely necessary. These Suspenders are recommended by our leading physicians to all ladies and young girls. Every lady should have them. Thousands will testify to their excellence and the advantages to be derived from wearing them. They are sold only through lady agents. Many ladies in other localities are making from a hundred to two hundred dollars per month, selling these and other new articles made by the same Company, and it can be done here. We have been asked by the manufacturers for the name of a reliable lady to act as their agent for this county. We advise such to write at once to the Queen City Suspender Company, Elm and Longworth Streets, Cincinnati, Ohio.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

ARTESIAN WELLS WANTED.—Parties who are prepared to contract for boring artesian wells are invited to send terms to Edward Frisbie, proprietor of the Reading Ranch, Anderson, Shasta County, Cal.

WE USE on our steam printing press superior machinery lubricating oil from the Phœnix Oil Works of Hutchings & Co., No. 517 Front street, San Francisco.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Land Purchasers' Association.—Location of principal place of business, San Francisco, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1878, an assessment of four ($4) dollars per share (being a part of the 43d installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at No. 641 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Saturday, the fourth (4th) day of January, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors. O. S. WRIGHT, Sec'y.

No. 641 Sacramento St., San Francisco, Cal.

Mount Jefferson Milling and Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, Cal.

NOTICE.—There is delinquent upon the following described stock on account of assessment (No. 5) levied on the Seventeenth day of October, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the seventeenth day of October, 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Tuesday, the seventeenth day of December, 1878, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. W. CLARK, Secretary.

Office, 318 Pine street, Room 6, San Francisco, Cal.

Summit Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Pinnias County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of November, A. D., 1878, an assessment, (No. 6,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the sixth (6th) day of January, A. D., 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the fourth day of February, A. D., 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

The California Fruit Growing Association.—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 1) of three ($3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the California Fruit Growing Association, held September 2d, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till Saturday, the 26th day of October, 1878, and the day of sale of delinquent stock is hereby postponed to Friday, the 22d day of November, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco.

POSTPONEMENT.—At a meeting of the Board of Directors held on the Nineteenth day of October, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till November 30th, 1878, and the day of sale of delinquent stock is hereby postponed to December 21st, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento Street, San Francisco, Cal.

Vigorit Powder Company.—Location of principal place of business, City and County of San Francisco, California. Location of works, California City, Marin County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No 1) levied on the first day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. Shares	Amount
Louis McLane, Trustee	30	437½	$218 75
Louis McLane, Trustee	32	½ of 875	218 75
G W Grayson, Trustee	92	1312½	656 25

H H Shinn, Trustee	93	400	200 00
H H Shinn, Trustee	94	112½	56 25

And in accordance with law, and an order of the Board of Directors, made on the First day of August, 1878, so many shares of each parcel of stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 1, 109 California street, on Wednesday, the second day of October, 1878, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. JAS. W. BAKER, Sec'y.

Office, No. 109 California street, Room 1, San Francisco, California.

POSTPONEMENT.—By an order of the Board of Directors made on the First day of October, 1878, the above sale is postponed until Monday, October 21st, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

POSTPONEMENT.—By an order of the Board of Directors made on the Eighteenth day of October, 1878, the above sale is postponed until Friday, November 1st, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

POSTPONEMENT.—By an order of the Board of Directors made on the first day of November, 1878, the above sale is postponed until Monday, November 18th, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

POSTPONEMENT.—By an order of the Board of Directors made on the eighteenth day of November, 1878, the above sale is postponed until Monday, December 2d, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

PAUL'S PULVERIZING BARREL.

A. B. PAUL.—*Sir:*—Having used two of your five-foot diameter Barrels, I can say that they are complete in every detail, add a thoroughly practical pulverizer. I donot if any better machine for pulverizing quartz, and to stand the same amount of wear and tear, can be devised. Yours, S. O. FREDERICK.

These pulverizers feed and discharge automatically, and reduce with expedition to a uniform size, as desired. Barrels made of from five to twenty tons a day capacity.

For particulars apply to

ALMARIN B. PAUL,

California Artesian Well

— AND —

MINING COMPANY,

202 Sansome Street, San Francisco

Having located, under the title, and at the place above indicated, for the purpose of conducting the ARTESIAN WELL, LAND IRRIGATING, PROSPECTING and MINING business, in all its various branches, on the Pacific Coast, we call your attention to the following facts:

1. That we have the best Machinery in the world, and so pronounced by the best judges in the world.
2. That we are practical Miners and Engineers, and understand what we are about.
3. That we sink Wells to any required depth, through all formations, including quicksand, boulders, and the hardest rock.
4. That we perform the above named service for about one-half the prices now charged for the same.
5. That as we do not expect to bore the whole Pacific Coast ourselves, we will sell our Machinery to parties who desire to purchase, and instruct them how to use it, free of charge.
6. That we want active and responsible Agents, and will guarantee a fortune to men of the right stamp.
7. That by calling at our office, or addressing us for circulars and catalogue, we will verify the above statements to the satisfaction of all reasonable and sane inquirers.
8. That if you or any of your friends are interested in the above facts and statements, we shall esteem it a favor if you or they will call upon or address us, and we will talk business and tell you the truth every time.

California Artesian Well and Mining Co.,

202 Sansome St., San Francisco, Cal.

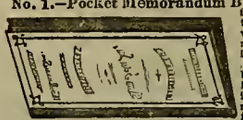
PROMPT AND SUCCESSFUL.—*Messrs. Dewey & Co:*—Gentlemen: Your Circular letter, 12th inst., informing me of successful termination of my application for patent received. Please accept thanks for the prompt and successful manner in which you have managed this business. Yours respectfully, J. H. CAVANAUGH.

Walla Walla, Dec. 24th.

HOLIDAY CABINET.

6 New and Useful articles for 25 cts. An unheard of offer. Examine the list.

No. 1.—Pocket Memorandum Book.—Made of finest Silicate, a material that never wears out. For memoranda, figuring, or writing of any description. Use an ordinary lead pencil. Writing can be instantly rubbed out with the fingers, leaving the pages clean for new entries. Complete Calendar for 1879 with each Book. Useful alike to school-boy, girl, or business man. Is alone worth the price of whole Cabinet.



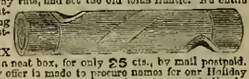
No. 2.—Youth's Box of Paints, with assorted paints and brushes. A pleasant and instructive pastime enabling those who have a taste for it to learn the beautiful art of water color painting.

No. 3.—Mystic Oracle, or Combination Cards.—A great mystery. Will enable you to learn (without their suspecting it) the age of any "old bach," "old maid," or other person; also to discover any number or numbers thought of. Never makes a mistake. Just the thing for social parties.

No. 4.—Eureka Pocket Book.—Suitable for young folks of either sex, but may be used by any one. Has compartments for bills, postage stamps, and currency. Neat, handy, and useful.

No. 5.—Jet Sleeve Buttons.—New and elegantly colored designs. They contain no metal, cannot tarnish, and are always bright and ornamental. Adapted alike to ladies and gentlemen, young or old.

No. 6.—French Merleton.—A rousing, rattling musical instrument, sure to please every wide-awake lad. Will scare the cats, drive away rats, and set the old folks frantic. An entire brass band in a nutshell. Jolliest thing ever made for Christmas.



We send all SIX articles, packed in a neat box, for only **25** cts., by mail postpaid. This extraordinary offer is made to procure names for our Holiday Catalogue, as we hope to make permanent customers of all who purchase the Cabinet. Persons not desiring ALL the articles can sell those not wanted for more than the cost of the whole. Clean, unused Postage Stamps taken same as cash. Address,

Eureka Trick and Novelty Co.,

P. O. Box 4514. **39 Ann St., New York.**

This advertisement will not appear again.

South Pacific Coast Railroad.

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstains, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

IRON PIPE

In Store for Sale at Lowest Market Ratee

500,000

FEET

BLACK AND GALVANIZED IRON PIPE

—FOR—

GAS AND WATER.

Sizes From ⅛ Inch to 6 Inches.

Braes, Wrought, Cast and Malleable Pipe fittinge for Gas, Steam and Water.

THE WESTERN SHORE ICE COMPANY.

Office, No. 330 Pine Street, San Francisco, Cal.

This Company having acquired from H. J. WEST, of London, the sole and exclusive right to manufacture and sell on the Pacific Coast his world renowned ICE-MAKING AND REFRIGERATING MACHINES, are prepared to supply the same to Hotels, Restaurants, Clubs, Breweries, Count y Towns and all manufacturers and consumers of Ice on this Coast.

A one-ton Machine will manufacture clear Ice in blocks of any desired thickn ss, from th ee inches to four, et and upwards, at a cost of *one quarter of a cent per pound.* A twenty-t on Machine will manufacture th same description of Ice at a cost of *one-twentieth of a cent per pound.* I cases where power is already on the p emis s, the cost of manufacture wi b less than one-half of the above figures. These Machines have obtained the First Class Prize Medal at the Great Exhibition in London of 1862; the Prize Medal at the Vienna Exhibition of 1873; and are now supplying Ice at the Paris Exposition. Many valuable improvements have been recently made, and they are now acknowledged to be the most complete and economical Ice-Making Machine in the world. Apparatus has already been constructed under these patents, which is now in successful operation in Great Britain, India, and New York, equivalent to the manufacture of a *million pounds of Ice daily.*

The accompanying drawing illustrates one of the patent transparent block-ice making machines manufactured by the WESTERN SHORE ICE COMPANY. To this apparatus a very plain and simple Steam Engine is attached for wo king the Air-pump. This is made direct acting, which means the use of all belts or gear-whe ls is avoided. Where, however, a separate motor exists, the Machine may be had without the Steam Engine, in which case there is of course a consequent proportionate reduction in the cost.

PATENT REFRIGERATING APPARATUS.

BREWERIES.—The eminent success which has attended the i troduction of this patent apparatus is ample proof of its great superiority over every other known invention of the kind. The most eminent br wers in the world, including Allsop & Sons, Truman, Hanbury, Buxton & Co., and Guinness & Co., have adopted this system, and have eleven of these Machines of the largest kind in use, while 38 of them are employed in various other Breweries in Great Britain.

Among the various other purposes for which this new patent machinery is valuable, are the cooling of air or liquids, preserving meat, fish, vegetables, fruits, etc., cooling Hospital Wards, Theaters, Dairies and for all purposes where a low t mperature is desired.

The WESTERN SHORE ICE COMPANY are prepared to supply Refrigerating Machines of a capacity for co ling from 50,000 to 500,000 cubic fe t of air per hour to 30° Fahr.

For Circulars and particulars as to prices and any other information desired, apply to the Secretary of the

Western Shore Ice Company,
330 Pine St., Rooms 61 & 62, San Francisco

All Machines Sold will be Accompanied by a Guarantee.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, DECEMBER 14, 1878. VOLUME XXXVII Number 24.

Deep-Mine Pumping Without Pump-Rods.

It is a well-known fact that the pumping machinery and the drainage of a mine make up the most costly items of expense, and hence every new idea bearing upon the problem is of some interest to the miner. We notice in a late number of *Dingler's Polytechnische's Journal* an improvement in pumping machinery, which, while not altogether new as to its main idea, still differs somewhat in its method of application from anything which we have seen. The inventor is a mining engineer, by the name of A. Angeley.

The purpose of the machine is to do away with the long system of pump-rods, etc., which is such a cumbrous instrument in deep mining. The principle by which this is effected is by means of pressure transmitted by the column of water itself. This is easily effected, according to the well-known property which fluids have of transmitting pressure equally in all directions, and also in virtue of the well-known incompressibility of water.

The simplest arrangement of this pump consists of two parts, the suction part and the compressor. The first consists of two vertical cylinders placed the one above the other, *A* and *B*, Fig. 1. In each of these cylinders moves a piston on opposite ends of the same piston rod; these pistons are without valves, and fit watertight. The piston rod passes through a stuffing box, both above and below the upper piston. The upper pistou, *a*, bears against a spiral spring, *r*, which is coiled about the piston rod, and rests against the top of the cylinder. The upper cylinder, *A*, is connected at its lower end by means of a side tube, *D*, with the ascending pipe, *T*, while the larger cylinder, *B*, is connected by means of the side tube, *D*, with the valve chamber, *E*; the latter is provided with valves, whose operation is evident from the cut.

The apparatus for compression consists of a pump cylinder, *F*, placed at the top of the pipe. It contains a piston, moved up and down by the handle, *P*. The discharge opening, o, is left free when the piston, *p*, has reached its highest point. Now, when the downward stroke is made, the pressure upon the piston, *p*, is transmitted almost without loss to the piston, *a*, and lifts this and with it *b*, while it at the same time compresses the spring, *r*. At the same time the space *x*, beneath *b*, fills with water. When *a* and *b* have completed their stroke, and the pressure on *x* is removed the spring *r* reacts on *a*, and the piston, *a*, and with it *b* are driven down. This, of course, has the effect of closing the lower valve chamber, *E*, and of forcing the water in *x* and *x'* up the pipe column, and out of the discharge opening at *O*.

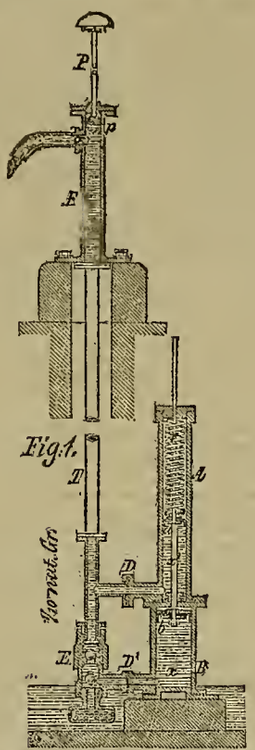
It would seem at first sight as if the amount of water flowing from o, would be exactly equal to that sucked in under the lower piston, *b*. This, however, is not the case; it is in fact found to be somewhat greater. This is due to the fact that the column of water in the pipe, *T*, continues in motion for a short time after the pistou, *b*, has finished its downward stroke in virtue of the momentum which it has acquired, hence a small additional amount over and above what has entered the cylinder, *x*, will enter the pipe, *T*, through the valve chamber, *E*. In order to obtain the maximum of useful effect, the pressure of the spring upon the small pistou, *a*, at its lowest position, must be a little greater than the sum of the pressures upon *a* and *b*.

The above arrangement is stated to be economically adapted to all wells deeper than 8 meters (26¼ feet).

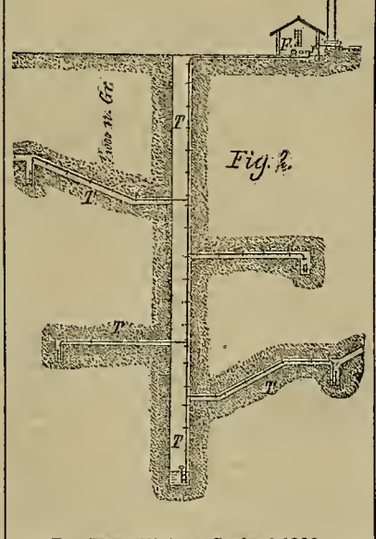
The advantage of this arrangement is especially apparent in deep-mine pumping. The entire system of pump-rods, pump-bobs and connections of all sorts is entirely done away with, and besides the advantages which result from this fact, is to be added another, viz.: the simple manner in which the hitherto difficult operation of connecting pumps at the foot of inclines, drifts, etc., with the main pump column is effected. The column of water in the pipes transmits pressure equally in all directions, and therefore it is plain that a complicated system of pumps, as is shown in Fig. 2, is not only perfectly practicable, but at the same time as easily applied as the arrangement at the bottom of the shaft.

Fig. 3 shows the arrangement which it is proposed to apply to deep-mine pumping. *F*, is the compressor which is here arranged horizontally, *T*, the pump column, *E*, the valve chamber, *A* and *B*, the two cylinders, and *a* and *b*, the two pistons, as in Fig. 1. Instead of the spring which gives the reaction in the small pump, we have here a system of weights, shown at *R*, which can be adjusted according to the length of the superincumbent pump column, for the station at which the pump is placed.

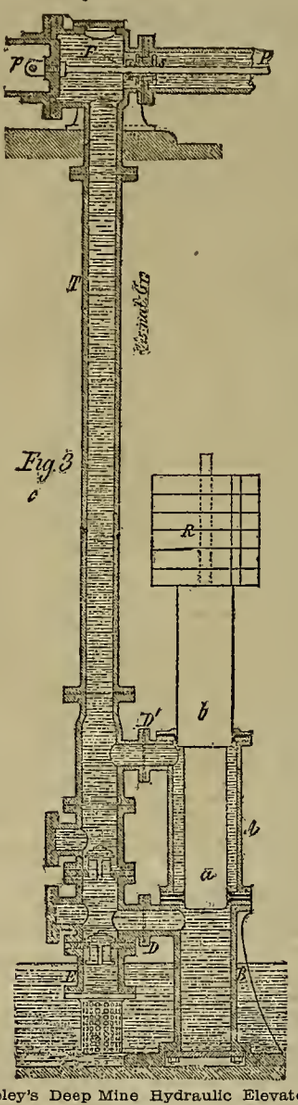
Of course in every such departure from the methods which experience has shown to be practicable, it is well to be conservative, and we are far from lending our unqualified endorsement to each an arrangement, in view of the fact well-known to all practical men that details are frequently of as vital importance to the success of any technical enterprise, as the principles themselves. But we feel certain that it is well to call the attention of our mechanical engineers to what may be when properly developed, a very important addition to the apparatus for deep-mine drainage on the Pacific coast.



Angeley's Hydraulic Elevator. Scale, 1-10.



For Deep Mining. Scale, 1-1000.



Angeley's Deep Mine Hydraulic Elevator. Scale, 1-25.

THE first mining corporation in Arizona was incorporated at Florence, Dec. 9th, as the "Arizona and Louisiana M. Co.," with a capital of $5,000,000, divided into 100,000 shares of stock. President, Jos. Collingwood; Secretary, John J. Devine; Treasurer, J. Collingwood & Co.; Attorney, Hon. G. H. Oury, Florence; Superintendent, M. A. Baldwin, San Francisco. Trustees—Jos. Collingwood, Hon. G. H. Oury, Hon. J. D. Walker (Florence), M. A. Baldwin (San Francisco), A. B. Seelye (New Orleans). The company will commence operations at once in developing the group of rich mines known as the "American Flag" series in the Santa Catalina mountains, about 40 miles southeast of Florence.

LIGHT rains quite general throughout the State, Dec. 9th.

Safety Attachment for Mine Cages.

Chas. W. Lane, of Aurora, Nevada, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, a novel device for disconnecting a mining cage or giraffe from the cable. As miners know very well, serious accidents often occur by a mining cage being drawn up too far, and going into the sheaves in the gallowe frame over the shaft, and very frequently lives are lost in this way. Many devices have been tried for the prevention of this kind of accidents, but they are, most of them, much too complicated, or necessitate material changes in the mechanism already constructed. Mr. Lane's device is intended to act automatically when the cage is raised to any given point above the mouth of the shaft; its object being to disconnect the cable from the cage when it is raised too high, and is in danger of being drawn into the sheavee. The usual safety apparatus for holding the cage in the guides catches the cage after the cable is disengaged from it. With this device no alterations whatever are made in the existing conditions of hoisting machinery, the device being applied to the cable just above the cage. It consists of a device which is placed between the end of the cable and the cage, connecting them together, formed of a box or casing in which is enclosed a latch bearing a hook formed on its upper end, and a trigger projecting through the side of said case. This hook engages with a link on the end of the cable, and in case the cage is raised too high, the trigger engages with a projecting bar or lug placed in the proper position, so that the hook is disengaged from the cable, being held by the guides in the usual way. The hook and trigger are formed in one piece, made in a peculiar shape, and a spring holds the catch so that it can easily be disengaged by meane of the trigger.

The form of construction is such that it possesses great strength and comparative lightness. The edges and sides of the case are solidly bolted together, and even should the pin on which the latch swings break, the cage would not be separated from the cable, as the latch could not get out of the casing and release the link. The peculiar shape of the latch is such that the link cannot be disengaged from it by any other means than the trigger striking the projection as described. Holes are formed in the lower part of the sides of the case, so that any water which may run down the cable will run out. This device may be applied to cages in shafts, giraffes in inclines, or any place where it is desired to disengage a cage or car from a cable or rope before it reaches any given point.

"MORRISON'S MINING DIGEST."—A. L. Bancroft & Co., of this city, have just issued the above-named book, compiled by R. S. Morrison, of Georgetown, Colorado. It is a digest of the law of mines and minerals, and of all controversies incident to the subject matter of mining, comprising the cases in the English and American reports from the year books to the present time. In the arrangement of the book, each syllabus has a separate heading, and as the general plan is based upon the idea that a digest as a work of refereuce should contain every possible aid to the speedy finding of the proposition sought, the index is so arranged as to contain under each title a reference to those syllabi which might have been collated under that title, but which, owing to their relation to other headings, have necessarily been distributed under such headings. The work contains decisions pertaining to mining from all the States, and from England, and combines in one convenient reference hook everything pertaining to the subject. It shows a vast amount of energy and work on the part of the compiler, and bears traces of diligent and faithful research. We know of no hook so useful to the legal profession on this coast, where so many mining cases occur. The references are all carefully given in each decision. The arrangement of the hook is admirable, and it is worthy of a place in the library of every one interested in mining matters, as there is no question in connection with the legal phases of the subject which will not be found answered in its pages.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

An Extensive Establishment.

The Manufacture of Bone Fertilizers.

EDITORS PRESS:—A short time ago your correspondent took a stroll out to the bone-charcoal and agricultural fertilizer manufactory of his old friends, Ohlandt & Buck, at the beginning of the second Long bridge in South San Francisco. These gentlemen commenced the business of making bone-charcoal and neats-foot oil in this city in 1865. By persevering industry and strict honesty in all their transactions, they have built up a business that overshadows all others of its kind on this coast, and, in extensiveness, is equaled by few in the United States. At their factory they give constant employment to more than 20 men.

Up to about 1870, Messrs. Ohlandt & Buck confined their operations exclusively to the manufacture of bone-charcoal and neat-foot oil. Since the latter date they have given a part of their attention to the manufacture of bone fertilizers.

Their long and extensive experience in the preparation of bones has enabled them to perfect a process—the invention of the proprietors themselves—by which they can turn out a better and cheaper article of bone-coal than has heretofore appeared in the market.

The energy and perseverance of Ohlandt & Buck have enabled them successfully to compete, during all these years, with the products of Eastern manufacturers, till they have succeeded in driving them almost completely from our markets. Their bone charcoal is used exclusively in all the sugar refineries on the Pacific coast, and they have now commenced shipping it to Mexico, where several sugar refineries have been lately started.

For the preparation of the bones for charcoal they have four large kilns, in which the bones are charred or carbonized, and every trace of animal matter is destroyed. The bones are next ground, when they go through a careful process of screening, and the article is then fit for use for general filtering purposes. The refuse or dust left after this operation is put through a chemical process, and thus is made the superphosphate.

The ground bone, bone-meal, or bone-flour, as it is variously called, according to the degree of fineness to which it is ground, we will describe by quoting from Prof. Hilgard. In his report to the President of the University for 1877, describing a visit to this same manufactory, he says: "This establishment was visited for the purpose of ascertaining what progress had been made in the manufacture of phosphate manures on the Pacific coast; and specimens of the article were courteously furnished by the proprietors. * * * * They manufacture both bone-meal and superphosphate, but for want of a market, chiefly the former. This is prepared in the most approved manner, by steaming the bones, which process not only renders the bones so friable as to be much more easily pulverizable, but is also well-known to increase materially the efficacy of the meal as a manure. The Professor then describes the superphosphate made by this firm, and draws a comparison between it and the Eastern article found in our market, by no means flattering to the latter.

For the manufacture of this bone-meal, the firm has lately introduced improved and expensive machinery. It is their policy to spare no expense in availing themselves of all the latest improvements in machinery that bear on their business. In some instances their best improvements have been the products of their own observation and experience.

But the chief interest which this extensive establishment has for us, is the manufacture of agricultural fertilizers. For this business they have advantages which no other firm on the Pacific coast can have. Their large bone-charcoal business with the sugar refineries, gives them very superior advantages. Schooners and lighters can take their products right from their own wharf, and carry them to any part of the bay, or to any ship in the harbor.

Strange to say, with all these advantages so near at home, the California farmers have not yet been persuaded to make any noticable use of these wonderful fertilizers. The firm stated to your correspondent, as they did to Prof. Hilgard, about a year ago, that the home consumption of their articles is very small, although for the past two years it has been on the increase, especially for use in vineyards and on lawns. They find markets for most of it in Germany, the Eastern States, Australia and New Zealand. The New Zealand market for these products was first opened up by this firm, and they can now dispose of all they send there; and as they showed us by quotations from New Zealand papers, their products bring a higher price than any other brands in that market. When we consider, too, the high freight from here to New Zealand, we cannot help feeling surprised, when we compare the appreciation of these fertilizers shown by the farmers away off in New Zealand with the wonderful lack of it shown by our California farmers. If there were no other fact than this, it would be a proof that there is a most urgent need of diffusing agricultural information of a very fundamental kind among our farmers. Of course the most obvious means of doing this is through our College of Agriculture at the University; but it does seem that the Grangers and other agricultural societies might, by some concerted movement, make themselves the means of diffusing such information through the agricultural press, pamphlets and lectures, by making and giving the results of experiments.

But still the extraordinary qualities of bone fertilizers are so notorious to all who possess the most elementary ideas on scientific agriculture, that the indifference to their use, by our California farmers, seems almost ludicrous. Our farmers take crop after crop, year after year, from their farms, never giving themselves a thought about the exhaustion of the soil, or that they are robbing themselves and their children of their future substance, till their land at last will refuse to pay the expense of cultivation. They lose sight of the simple fact that for the development of their crops not only must the soil be prepared for the seed, but the soil itself must contain certain mineral or earthy matter which enters into the structure of their fruits and cereals. When the soil contains sufficient quantities of this the farmer will be rewarded for his labor—otherwise, not. It is this substance that comes out of the soil that constitues his profit. Every crop removed from the soil removes a certain percentage of its fertility, and if the process were continued without renewing the fertility, nothing is clearer than that the soil would soon be exhausted. When the farmer sells a bushel of grain, or a ton of hay, he sells so much of the mineral wealth of his land. These mineral constituents are generally distributed on the surface in limited quantities. The carbonic acid, nitrogen and ammonia compounds are constantly being returned to the soil through the atmosphere, by nature herself, according to the immutable laws of circulation. But the phosphates and potash of the soil are rapidly exhausted, and these must be returned to the soil by the agriculturist himself.

The phosphoric acid from our farms is carried away in grain bags, fruit boxes and animal frames on our railroads to our large cities, where it is lost; or is taken in ships to England. Says Prof. Waring: "Phosphoric acid forms about one-half of the ashes of wheat, rye, corn, buckwheat and oats; nearly the same proportion of those of barley, peas, beans and linseed; an important part of the ashes of potatoes and turnips; the cultivation of our whole country has been such as to take away phosphoric acid from the soil without returning it. Every hundred bushels of wheat sold contains about 60 pounds of phosphoric acid. For every cow kept on a pasture in the summer, there is carried off in veal, butter and cheese, not less than 50 pounds of phosphate of lime (bone earth) on an average. This removal of one of the most valuable constituents of the soil has been the cause of more exhaustion of farms and more emigration in search of fertile districts than any other acts of injudicious farmers."

No inference can be plainer from these facts than that the present methods of farming in use in California will prove ruinous in the end. Since this loss to the land which we have spoken of must be returned to the soil by the farmer himself, it follows that the next thing to look at is the best means of effecting this end. All know that bones are the most available source of phosphoric acid—ordinary bone-meal containing from 24% to 25% of phosphoric acid, besides other desirable fertilizing qualities. Prof. J. T. W. Johnson (in Agricultural Chemistry) says: "Few substances have of late years done so much to increase the agricultural produce of various parts of England, as the use of ground bones for manuring the land."

England imports thousands of tons of fertilizers every year, in addition to which every particle of material valuable as manure—all the excrements of the large cities, even—is saved. The fertility of our soils goes not only to feed English mouths, but to increase her harvests, too.

In the same part of the "report" above alluded to, Prof. Hilgard says: "It can hardly be questioned that the hauling of common stable manures, from the city stables to the truck gardens outside of the city, very frequently renders that manure more expensive than would be an amount of high-grade superphosphate, producing a corresponding commercial result. It cannot be long before this will be understood, and the shipping of our phosphates to Australia replaced by sales in the home market. I cannot help thinking that if a first-class fertilizer of this kind, sold by assay of actual value as are other products, were to be had in the San Francisco market it would soon come into use, and that a most profitable industry would thus speedily be created. Wherever crops producing a high value per acre (such as the fruits of California) are prominent in culture, the introduction of the use of concentrated commercial fertilizers, to increase and improve the products, cannot be long delayed."

Undoubtedly, as suggested by Prof. Hilgard, fruit culture will be the first field for the introduction of these fertilizers, and they have already begun to be used for this purpose; but they can be used with almost as much profit in the cultivation of cereals. It is not uncommon for the number of bushels to the acre to be doubled by the proper use of bone fertilizers.

The effect of these bone fertilizers on the soil is not exhausted with the present crop, but its effects will run through several years.

Messrs. Ohlandt & Buck are now preparing to give more attention than formerly to the sale of their fertilizers in the home market, and all will have a chance to give them a fair trial. They have also commenced the importation of guano; but as yet the greater part of this is also intended for export. From the personal knowledge your correspondent has of these gentlemen, we are sure that all who deal with them will be profited and satisfied. M.

Advancement in Mining Stock Gambling and Results.

[By ALMARIN B. PAUL.]

When an old California miner casts his mind back a quarter of a century, and recalls the mechanical devices for working the precious metals of our quartz lodes, and then over the active field of these improved times, he sees a stride so wonderful as to almost make him question the fact that so much has been done in so limited a period. That we are building up a pursuit, soon to be so productive of wealth, and so perfect and extensive in operation, and so profitable in results, as to enlist the attention of the mining world, is as sure as that we have already done so much. Activity, quantity and perfection, are the prevailing ideas when the mind once rests on mining, mining machinery and production.

Not only in the mechanical department of mining is there such rapid progress, but in the science of mining.

The practical hard-fisted miner—the prince of experts, by his years of toil and observation, in delving for the precious metals, has studied the science of the rocks and the lodes, till he is as thorough, practical and enlarged in his ideas, as the advances of the mechanical devices which may surround him.

Such is the fact, and we as a mining community have much to be proud of for our advancement, and to-day should be the wealthiest population on the globe.

The great mass of people should be prosperous and happy, through the vast mineral product of the Pacific States; but is it so, and why is it not? Everything in nature has its parasites, and so has legitimate mining in these villianous "put up" jobs to rob the credulous outsider with his little capital for a venture in mining. I don't know but what I can say, too, that this branch of mining (?) enterprise has advanced to such enlarged conditions that the prisons of years past are only good for the smaller rogues.

To be polite, we must accept the term of "stock gambling," this idle, non-productive, blood-sucking parasite of mining, a pursuit which has infamy as its companion, immorality, ruin and degradation as its climax.

In the face of such grand achievements in mining, science, mechanical and development of vast mineral belts, why is it that intelligent men and women, too, love so much to "sport" in stock rather than legitimate delving into the bosom of nature to bring forth her wealth, and to receive therefrom, her undefiled treasures, for peace, comfort and elevation.

To destroy this wild stock gambling spirit should be the aim of every honest newspaper on the coast, as its destruction is prosperity and comfort of the masses, the re-enstallment of condition as it was in former years. The making of life and thrift in every mining locality, instead of this centralizing capital among the few, and in special localities where gambling deals are the easiest bred. Was capital more plentiful for good legitimate properties, no matter where located, a cheer would go up from every county of every Pacific State and Territory, as then there would be a reward for meritorious mines, which each adventurer would be willing to expend muscle and money to make so by developments.

As it is, what is the use of the miner wearing himself out to develop when a hole in the ground or a "hatful of ore" has millions in it for the few when handled by unscrupulous operators. Drop this stock gambling and embark in enterprises where your capital has a show of legitimate reward. With your capital build up gold and silver-producing manufactures; develop your mines and look for your reward by honest industry and attention to legitimate mining. Gather your wealth from mother earth and save your brains from the whirlwinds and typhoons of stock speculation. To become a producer of wealth instead of a consumer, should be the endeaver of every intelligent man and woman. Legitimate mining produces—stock gambling consumes, and too often not only wealth but character.

As I before remarked, the strides are such that mining, through its expeditious working and cheapened machinery, is becoming more profitable every year, and he who now seeks the mountains with capital or muscle, will, in a few years, reap a rich reward. And now is the time the whole United States are having an eye to legitimate mining. It is becoming an acknowledged fact that with economy, skill and experience it can stand on a par with other manufacturing ventures. So let us all lend a hand and voice in building up our mining localities, and thus more universally distribute wealth, comfort, peace and intelligent efforts.

San Francisco, Dec. 1st, 1878.

THE suit of the United States against Claflin & Co., of New York, for the recovery of nearly $250,000, has been decided by the United States Supreme Court in favor of defendants.

Pedagogic Plunder.

The sound of bribery and corruption has fallen to the minor notes. Long enough has the din of purchased congressional eloquence, of purchased judicial decision, of purchased action in all departments of trust, grated on the ear. The people must be tired of the "heavy villain" in the drama of public affairs, and the disclosures of the last few days furnish the lighter shades of human depravity for popular contemplation. And yet we are not sure that it is indeed so light as at first it appears. There are some petty transgressions which strike directly at the foundation of all virtue, truth and integrity. Let us see if such be the outcroppings of evil to which we allude.

On the day before the regular examination for teachers' certificates in this city, the *Evening Bulletin* printed in full the questions which had been prepared in the office of the State Superintendent of Public Instruction, and sent thence to the several counties of the State under seal, to be opened only on the day of the examination. This publication demonstrated that the questions which the State Superintendent sends out are not guarded as they should be, but that persons, other than the boards of examination, get possession of these State secrets and use them to extort money from candidates for teachers' certificates; because, by having opportunity to study the questions beforehand and memorize answers thereto, any one can gain the coveted certificate even though wholy devoid of proper general qualification. This publication of the questions threw the examinations overboard, and has been followed by protracted examination by the city Board of Education to discover, if possible, by whose agency this abomination has been enabled to flourish. These examinations are still in progress and it is impossible as yet to determine who is the guilty party, who has betrayed the trust of the State department of public instruction.

It is probable that farther investigation will disclose this fact, and we shall have opportunity to expose for public execration the base trafficker in public trusts. Enough has already been discovered to determine that the evil is not a recent one, but that for about ten years it has been possible, by the villainy of some one, to secure, in advance, copies of questions which the public supposes are held from all eyes until the time of the examinations. It has been shown that in this city, if not elsewhere, candidates for examination have been crammed with answers, and made to pay high a price for the same by unprincipled parties connected with our public school system. The result is, that certificates have been secured by persons who could not have obtained them by fair examination, and the public money has been paid for instruction to those who corruptly purchased their title to teach, and the public service has thus been outraged.

We have called these minor notes of depravity in view of the heavy dirges of corruption which have been heard from Congress, from our public works, and from our public institutions of trust and savings. And yet it is hard to conceive of depravity which is more densely evil in its tendencies and influences than that which invades our public schools, and which forces us to entrust our children to the care of corrupt and ignorant persons whom we fondly believe are of good moral character, and wise in the themes on which we seek instruction. Our little ones are taught by us with all diligence to respect their teachers, to look to them for moral and educational guidance during the hours that they are away from us. Our youth are enjoined to obey and respect these exponents of the State's desire to train them up in principles of good behavior and of general culture. Now we are forced to see that, in some cases, we have taught respect for persons who have gained their trusted places by the basest means—who have entered upon their work with fraud, corruption and deception. We send for truth to those who have acted lies; for honesty to those who have, by the aid of coin, stolen their certificates of qualification; for wisdom to those who are confessedly ignorant and incompetent. Could there be a more startling disclosure?

This matter has not yet been probed to the bottom, but we trust it may be. It is the more serious from the fact that the evil has been of long continuance. Let something be done now which shall check the evil for a generation at least. Let the brand of infamy be placed so plainly upon all who have been concerned in this evil work, that it shall serve as a wholesome warning to all who would profit by the unholy traffic. Let the investigation go on. Let us all know who are the people's foes, and who, for petty plunder, would turn our public school system into a hotbed for crime, corruption and incompetence.

TRADE DOLLARS AS BULLION.—Secretary Sherman says there is a strong speculative feeling springing up to give silver bullion in the form of the trade dollar a value greater than other bullion, thus discriminating in favor of bullion held in China against bullion in the hands of our miners. The Secretary says trade dollars will be bought as bullion upon bids each Wednesday, and that preference will be given to trade dollars over other bullion. This is the Secretary's answer to the San Francisco offer of 1,000,000 trade dollars deliverable there from China within sixty days.—*Bulletin.*

MECHANICAL PROGRESS.

A German Arrangement for Deep Mine Pumping.

We read in foreign exchanges an account of a pumping engine of great power, recently constructed for the Hartz silver mine. *Iron* says that after the Hartz famous silver-lead mine had reached a depth of more than 2,800 feet it was found that the pumping system of raising water in numerous shafts with primitive machinery, would not, in the future, be able to cope with the growing bodies of water. A deep vertical shaft was therefore sunk beyond the hanging wall of the main lode, the Burgstadter Zug, which was to serve for the centralization of the pumping machinery, and a large gallery was driven at a depth of 670 feet below the lowest drainage adit, the Ernst August, to serve as a general reservoir. The problem to be solved was to construct machinery which would utilize the supply of water coming from the main ditch and pond system of the district to raise the mine water for the reservoir level to the Ernst August drainage adit, a hight of 738 feet. The depth of the reservoir below the point where the supply tunnel enters the Maric shaft (95 feet) was 1,959 feet. It was decided to use two water-pressure engines placed in the reservoir level, and as the water for driving the engines had to be conducted to the drainage level also, the effective head of water was 1,209 feet. By this arrangement the necessity of using a long pump rod, requiring frequent repair, was avoided, a difficulty which placing the engine in the adit level would have entailed. The disposition chosen more than counterbalanced the drawbacks of an increased length of pipe, and its greater thickness in the lower portions to resist the pressure of 59 atmospheres. The difficulty in constructing a water-pressure machine under such conditions was that as water is incompressible, and that as it transmits shocks in all directions, any sudden changes of the diameter of the vessels through which it flows are apt to prove disastrous to the machinery. The twin engines are direct-acting, and are provided with a fly-wheel, upon the shaft of which are the eccentrics which move the piston-valve gear. The gearing had to be so arranged that the time of the stroke of the main piston coincided exactly with that of the valve pistons, but as it is manifestly impossible to preserve so accurate mounting for any length of time, the openings of the valve were not entirely closed at the end of the stroke, by which means sudden shocks are avoided. This, it is true, entails a loss of power, but it was chosen as being the least of two evils. The greatest amount of water to be pumped per machine was 600 gallons per minute. The theoretical power of the water at disposal was 220-horse power, but careful experiments showed that only 76% or 35% were utilized when the number of strokes was 12. It was found that as soon as the number of strokes per minute rose beyond 16, the valves of the pumps were subjected to shocks which endangered the machine.

SHIPPING A STEAMBOAT TO SOUTH AMERICA.—A complete steamboat was shipped from Pittsburg, Pennsylvania, on the 19th of October last, by way of New York, to be delivered to the United States of Colombia, South America. It was shipped in sections, and will be put together when it reaches its destination by men who will be sent from Pittsburg for that purpose. The hull is 150 feet long, 29 feet 9 inches beam, 4 feet depth, 28 inches shear, and made of homogeneous and tensile strength of 70,000. The machinery consists of 15-inch cylinders, five-feet stroke, two patent cut-off boilers, 45 inches in diameter, 16 feet long, with 41 3½-inch tubes each, which were tested before leaving to 245 pounds. The boilers are also of homogeneous steel. The cabin was made something after the style of our Western river boats. The hull is all steel except the bulkheads and angle-irons; the cylinder "timbers" also being steel. The wheel is of iron. The cabin-stanchions are fastened to the hull and stern-bulkhead. The name of the steamboat is the *Francisco Montaya*, and she is designed to run on the Magdalena river.

THE SIZES OF BALES.—The following practical notes may be found useful by those whose business is in the way of raw produce. Cotton bales vary from 4 to 5 feet long, and from 1 foot to 2 feet 6 inches in width and depth. Their weight varies from 300 to 550 lbs. The dimensions are different at different shipping ports: thus, Indian bales weigh from 350 to 400 lbs.; American bales 400 lbs. to 500 lbs.; Egyptian bales about the same; Calcutta bales of hemp measure 4 feet 8 by 2 feet by 2 feet; Calcutta bales of jute measure 3 feet 6 by 2 feet by 1 foot; Bombay bales of hides measure 7 feet by 3 feet by 2 feet, and weigh 17 cwts. Bales of cocoa-nut fiber measure 3 feet by 2 feet by 2 feet, and weigh 400 lbs.

CAR PLANNING.—A very sensible improvement has been introduced in a car on the College Hill railroad, a suburban narrow-gauge road at Cincinnati, where the seats, which run lengthwise in order to give more room, are placed back to back, so that the passenger faces outward. The windows also are made nearly continuous, instead of being separated by wide panels to interrupt the view.

IRON GALVANIZING FURNACE.—In galvanizing iron the main point to ensure a uniform coating of zinc is the maintenance of a thin bath of metal. Unfortunately the zinc absorbs iron, thickens, and as the temperature must be rapidly raised, when it does so this absorption goes on increasing until the metal is unfit for further use. This is aggravated by the fact that the metal is melted in cast or wrought iron vessels heated from below. *Iron* says that in order to avoid the disadvantages of iron vessels, and yet retain ample working space above the surface of the metal, F. A. Thum, of Lauback, Germany, has constructed a furnace resembling somewhat a reverberatory furnace. It has a fireplace and a chimney at each end, the part of the hearth connecting the two being arched over. The rest of the rectangular hearth is perfectly open above, so that the heat-conducting power of the metal is relied upon to keep it at the proper temperature in that part of the hearth. The slabs of fresh zinc are introduced through doors communicating with the hot ends. The staying of the furnace has to be very strong, in order to prevent any accidents to the archiug over the ends of the hearth.

WASHING OUT BOILERS WITH HOT WATER.—A letter from John E. Martin to the *Railroad Gazette* contains the following: I notice in the discussion on boilers at the last convention of master mechanics, that Mr. Hudson recommends washing out locomotive boilers with hot water. I have used the injector for that purpose lately and with great success. We connect the boilers to be washed out with the injector of another locomotive by means of wrought-iron piping and a flexible hose pipe that will stand a good pressure. A nozzle of five-sixteenths of an inch is used on the hose. With such a nozzle and with a boiler pressure of about 130 pounds we throw a stream of hot water of 140° Fahr. temperature into the boiler to be washed out. A gauge on the hose pipe showed a pressure of 110 pounds, equal to a vertical weight of nearly 250 feet. The hot water loosens the scale more effectually than cold water, and the force of the stream is all that can be desired. A stream of water can be thrown a distance of 60 feet and could be used as a fire extinguisher.

MECHANICAL EDUCATION.—Mechanical education in Russia has been carried to a point of success not yet reached in this country. Col. Forney, of the Philadelphia *Press*, writing from the Paris exhibition, remarks that American progress has astonished Europe, yet "Germany, Switzerland and France, have methods and systems that deserve to be studied. Even Russia may be a model for all of us. Yesterday I saw some machinery at the exhibition, and my admiration increased as I was told that much of this exquisite work was made by the youth, many of them sons of the best families, sent into the machine shops to learn trades as a part of their education. There was no alternative; they were compelled to pass this ordeal. The Government is the master, and young Russia must obey; and now obedience becomes a delight; and it is as much the fashion to finish a practical education in this way, as formerly it was the fashion to pass through a school or an academy, or college, for the easy acquisition of superficial accomplishments."

MANUFACTURING STATES.—The *North American Review* says: "The relative manufacturing rank of the several States is being made a subject of discussion in the Southern and Western States, which find Pennsylvania ahead by 994 establishments and $39,827,525 capital—dividing place with New York in other respects, and followed by Massachusetts, Ohio, Illinois and Missouri. These statistics were approximately correct when they were collected. They have since changed somewhat, but not so that they can be revised at once. When the figures of 1880 are given, the West will undoubtedly show large gains, and the South as well; and if the existing conditions are preserved, some of those who are anxious now will be greatly gratified, for manufacturing has increased since 1870.

PRIZE CATTLE CARS.—The Royal Society for the Prevention of Cruelty to Animals (England), having offered £400 in prizes for improved cattle trucks, the judges, in June last, inspected 55 competing models, and selected four, which they requested the inventors to build of full size, in order that if necessary a practical trial of their capabilities might be made. Three of these trucks have now been completed, and one inventor has been allowed further time. The traffic managers of the railways companies expressed their readiness to facilitate the proposed trials, and to adopt a simple, light, cheap, safe and workable method of watering animals in transit, if only the objectionable features hitherto found existing in most proposals of the kind can be really removed.

A MEXICAN EXPOSITION.—The Mexican Minister of Public Works has announced that the government is about to nominate a special commission to organize such an exhibition in the City of Mexico at a conveniently early date. November 18th, 1879, has been suggested as the date of the opening of the exhibition. It is to be confined exclusively to American and Mexican productions, and to be under the direct auspices of the Mexican government.

SCIENTIFIC PROGRESS.

Estimation of Phosphorus in Steel and Iron.

The *Iron Age*, translating from a German scientific journal, describes the method followed by Prof. Filkener, of Berlin, in the estimation of phosphorus in iron and steel. The method may be of use and interest to some of our analysts. Prof. Filkener gives the iron in hydrochloric acid of 1.4 spec. grav., evaporates to dryness in a porcelain crucible, heats to 200° to 250° C., dissolves in strong hydrochloric acid and filters. He precipitates with a molybdic acid solution holding 33 grams molybdic acid, 141 grams nitric acid and 19.4 grams of ammonia in one liter. The volume of the precipitating solution must be at least four times that of the phosphorus solution, only two-thirds being decomposed by the existing phosphoric acid. For every 100 c. c. of the mixture 25 grams of nitrate of ammonia must be dissolved in it. The precipitate is washed with a 20% solution of nitrate of ammonia, with which in the beginning nitric acid to the amount of one-thirtieth in volume of nitric acid has been added. In order to convert the precipitate into a weighable compound, the greater part of the contents of the filter is transferred to a weighed porcelain crucible. Portions adhering to the filter are dissolved with dilute warm ammonia, which is concentrated. An excess of nitric acid is added, and the mass is then brought into the porcelain crucible, where the liquid is evaporated and the nitrate of ammonia is removed by careful heating over a flame cooled with wire gauze. This does not decompose the phosphomolybdate of ammonia, the water of crystallization only being driven off. The residue attracts moisture readily, and must therefore be rapidly weighed. A second addition of nitrate of ammonia, etc., changes the weight but very little—about only 0.1 of 1%. The precipitate contains $72\,MoO_3\,(9-x)$, $Am_2O + x\,H_2O$ for $3\,P_2O_5$. In calculating the percentage of phosphorus, x may be assumed to be $x = 1$. Then the precipitate contains 3.794% P_2O_5. If arsenic acid is present it enters the precipitate; the latter is then dissolved in ammonia and the solution saturated with pure sulphureted hydrogen. Then an addition of sulphur dissolved in sulphide of sodium is made, the solution is warmed, precipitated with hydrochloric acid, the filtrate boiled down and precipitated again with molybdic acid. Chloride of iron and soluble silica are stated to be without any injurious effect.

A MARBLE-BORING SPONGE.—The New York Academy of Sciences has had an interesting specimen of marble which came from a ship wrecked in 1871, off the south coast of Long Island. The marble was perfectly honeycombed by some marine-boring animal. The *Scientific American* says that Dr. Newberry believes that it was due to the ravages of a species of sponge of the genus *Cliona*, and this view has been recently indorsed in a note on the subject published by Prof. A. E. Verrill, who has had an opportunity of examining some specimens sent to the Peabody Museum of Yale College. Prof. Verrill states that the exposed portions of the slabs examined by him are thoroughly penetrated to the depth of one or two inches by the crooked and irregular borings or galleries of the sponge, *Cliona sulphurea*, so as to reduce them to a complete honeycomb, readily crumbling in the fingers. The marble is perfectly sound and unaltered beyond the borings. He says that the rapid destruction of the shells of oysters, etc., by the borings of this sponge has long been familiar to him, but he has never before seen examples of its effects on marble or limestone; for calcareous rocks do not occur along those portions of our coast inhabited by the animal. He suggests that its ability to rapidly destroy such rocks might have a practical bearing in case of submarine structures of limestone or other similar materials.

LEAD AS IODATE.—We learn from the *Polytechnic Review* that Mr. C. A. Cameron, in a paper which he has read before the Society of Analysts at Dublin, states that as a result of experiments, he has found plumbic iodate absolutely insoluble practically. Iodate acid and alkaline iodates precipitate lead far more perfectly than sulphuric acid, even when alcohol is added to the latter. The plumbic iodate formed is weighed, or, if a volumetrical inertia be desired, the following is the process: Precipitate with standard solution of soluble iodate, and filter off the plumbic iodate. The filtrate and washings are to be mixed, and the excess of iodic acid contained in them estimated volumetrically by the hydrochloric acid and hyposulphate method. As it is almost impossible to procure pure iodic acid or potassium iodate, the solution of iodate must be standardized by means of a solution of pure nitrate of lead. Owing to the slight solubility of plumbic iodate in alkaline chlorides, iodides, and bromides, none of these salts must be present. HCl rapidly dissolves iodate and lead.

LARGE FUNGI.—Among noteworthy specimens seen at the recent Edinburg Fungus Show was a *Polyporus giganteus* three feet six inches in diameter, and a puff-ball (*Lycoperdon giganteum*), fifty-four inches in circumference and weighing twenty pounds.

New Notes on Stridulation.

According to the Science Summary, in the *Independent*, some fresh observations on the buzzing of insects have been made by J. Perez. He believes that the cause of buzzing certainly resides in the wings. In the Hymenoptera and Diptera the buzzing is due to two distinct causes—one the vibration of which the articulation of the wing is the seat, and which constitutes true buzzing; the other the friction of the wing, an effect which more or less modifies the former. In moths of strong flight, such as the sphinges, the soft and full buzzing which these insects produce is only due to the friction of the air by the wings. This sound, which is always grave, is alone produced. It is not accompanied by the basal beatings, owing to a peculiar organization, and especially to the presence of the scales. In the dragon-flies, also, in which the base of the wing is furnished with soft fleshy parts, no true buzzing occurs; but a simple rustling, due to the friction of the organs of flight. M. Perez believes that the passage of air through the respiratory orifices has nothing to do with the production of sound, as when injured or closed the buzzing goes on. When the stigmats or air-holes are stopped hermetically, as was done by Barmeister, the buzzing is only weakened, as the insect itself is partially asphyxiated by the loss of fresh air. When, as Chabrier did, Perez stuck together the wings of a fly, the sound was still produced, as the base of the wing continued to vibrate and the buzzing sound to be produced. But all buzzing was stopped if, by holding the wings pressed together, over as large an extent as possible, so as to exert a certain traction upon their bases, all movements of these organs is rendered impossible. In whatever way the wings are confined, provided their immobility be incomplete, the buzzing absolutely ceases; contrary to Hunter's statement. M. Perez's observations can be readily repeated, if nice methods of procedure are followed, by observers in this country, and this vexed question be set at rest.

SPONTANEOUS COMBUSTION.—Dr. Hoffman has called attention to some curious cases of spontaneous ignition of hydrogen in air. The phenomenon has been noticed in factories where large quantities of zinc were being dissolved in hydrochloric acid for the preparation of zinc chloride. Violent explosions took place when no flame was near; and it was eventually ascertained that the gas took fire spontaneously. It appears to be caused by fragments of very porous zinc, which, when lifted above the surface of the liquid during the violent evolution of the gas, and so brought in contact with hydrogen and air, act just as spongy platinum would do under the circumstances. The author recommends the performance of such operations in the open air. The ignition can be shown by treating a few kilogrammes of finely divided zinc with acid. The "zinc dust" may even ignite by contact with water.

GEOLOGICAL.—The *Polytechnic Review* learns through a private letter from Dr. T. Sterry Hunt, that the Geological Congress at Paris was a great success. There were 260 members present; and various committees were formed, the work of which will prove highly important and useful. Arrangements were made for a Congress, to be held in 1881, at Bologna. From another source we learn that Dr. Hunt has returned from England, and will spend the winter in Montreal, Canada, where, as scientific men will be interested to hear, he expects to devote himself to important scientific investigations. Before leaving England, he accepted an invitation to deliver two lectures at Cambridge—a graceful and merited recognition of the ability and reputation of an American *savant*.

SOLAR AND ARTIFICIAL HEAT.—Prof. S. P. Langely, Director of the Allegheny Observatory, in addition to the routine work connected with the institution over which he presides, has lately been busily engaged in completing a direct experimental comparison between the heat of the sun and the highest heat attainable in the arts. The result of his investigations indicate that the sun's *intrinsic* heat is almost beyond comparison greater than that of any blast furnace, and far larger than has been reckoned by the French physicists.

AMERICAN MICROSCOPES.—Prof. J. Gibbons Hunt, M. D., of Philadelphia, in a recent lecture, stated that, in his opinion (and he is one of the most experienced microscopists in this country), England, which first introduced cheap instruments, sits at the feet of America in respect to both lenses and mechanical appliances. He says it is affectation or stupidity for Americans to send to Europe for microscopes when they can purchase better ones at home.

"SCIENCE NEWS."—A new publication, which will interest many who desire to keep posted on current scientific progress, without recourse to the heavier publications, is *Science News*, of which we receive the initial number from the publisher, S. E. Cassino, Naturalists' Agency, Salem, Mass. It is ably edited, and starts with a full list of contributors from among our best scientific scholars. It appears twice a month, and will doubtless attain a wide circulation.

Mining Share Market.

The market has been hardly less quiet this week than last. The Sierra Nevada is dropping out of sight still further, in the face of reports, such as the following from the Gold Hill *News:*

"At the mine work ie progressing well on every hand, aud neither men nor money are being spared to forward the developments as fast as possible."

California has paid a dividend of $1 per share. But it is still simply folly to attempt to argue on whatever grounds, either for or against the bonanzas. Bodie has excited comment by something of a fall this week. The *Standard* of December 2d still expects the Comstock crash will react in favor of Mono stocks. Eureka Con. has remained steady, always a protest against the neglect of Central Nevada mines. It is strange that the protest is not listened to. It is attracting more attention, and it will not be long before many Comstock mines must yield place on the lists to others scattered on the coast, that is, provided a mine must be listed in order to succeed, which is by no means decided. The Grass Valley *Union*, in giving its last monthly summary, calls attention to the fact that Nevada county mines have not been on the boards as a rule, and yet in her own way Nevada county is not equaled by any other county in the State.

A glance at our column of "Highest and Lowest," will give some idea of the decreasing activity in stock operations. Many mines have no sales to report for week after week.

Bullion Shipments.

Since our last issue, we have noticed the following shipments of bullion:

California.—Bodie, Dec. 6th, $10,200; Extra, Nov. 30th, $1,977.42—total for month, $21,146; Klamath Quartz, Dec. 2d, $4,275; Standard, Dec. 5th, $16,907; December 8th, $17,583.72.

Dakota.—Homestake, Dec. 8th, $26,622.

Nevada.—California, Dec. 7th, $106,335.98; Grand Prize, Dec. 9th, $32,000; Hamburg, from Dec. 1st to 7th, $11,319.19; Hillside, Dec. 8th, $5,150; Dec. 10th, $5,133; Jefferson, Dec. 6th, $1,588.22; Manhattan, Dec. 5th, $11,800; 9th, $10,841.87—total for November, $100,597.31; Navajo, Dec. 9th, $5,700; Northern Belle, Dec. 4th, $4,485.61; Dec. 7th, $4,407.62; Raymond & Ely, Nov. 30th, $4,904.31; Dec. 4th, $9,636.54.

DISTANCES FROM SAN FRANCISCO.—The South Pacific Coast R. R. (narrow-gauge), furnishes the following schedule of distances on its line from San Francisco: To Alameda Point (by fast steamer), 5 miles; Alameda, 10; West San Leandro, 10; West San Lorenzo, 17; Mt. Eden, 21; Alvarado, 24; Hall's, 25; Newark, 30; Mowry's, 31; Alviso, 38; Agnew, 41; Santa Clara, 44; San Jose, 46; Lovelady's, 51; Los Gatos, 56; Alma, 58. This ie the ehortest and quickest railroad line from San Francisco to San Jose, and in several respects the pleasantest. It is also rapidly increasing in freight and passenger traffic and general popularity.

FOR 11 months of the present year the immigration to this country is given at 72,147, against 52,009 for the same period last year.

THE American bark *Devonshire*, seized by the Chilean authorities while loading guano, has been released.

SOJOURNER TRUTH, a colored woman over 100 years old, has lately lectured in New York.

FIFTY cases of leprosy are said to exist in La Fourche, La.

Mining Summary.

The following is mostly condensed from journals published in the Interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

ST LOUIS.—*Dispatch*, Dec. 7: This is the name of a prospect at Kennedy Flat, to the west of the Kennedy mine. It was discovered a few months ago by a man named Cox, who recently sold out the claim to A. Farrie. The new owner is developing it as fast as possible. A shaft reaches 35 feet, with a 7-foot ledge at the bottom. The rock prospects well. A small piece of quartz, picked carelessly from the dump, was pounded in a mortar, and made a handsome showing of gold. Judging from this test, the rock would pay in the neighborhood of $20 per ton.

VOLCANO AND BEYOND.—The rock in Downs mine shows amazingly rich, as development proceeds. It is roughly estimated that there is $50,000 already in sight. The Rising Sun mill has got to work again, with cheering prospects. Toop and McQuaid are crushing some rock from their claim at Mace's mill. It is estimated to yield $30 per ton. Numbers of men are out prospecting for quartz beyond Volcano. Frakes & Storey have about finished the fixing up of their one-stamp Kendall mill near Aqueduct. It is to be started up on ore from Mattingly & Bartlett's claim.

MISCELLANEOUS.—At the Oneida mine 115 out of 200 feet of sinking, is accomplished. A small vein of quartz has been struck recently in the Talisman at Amador City. The discovery is not of particular moment at present, but may develop into importance. According to the *Ledger*, the Keystone company have lately made a good clean-up, and are still taking out large quantities of good rock.

CALAVERAS.

WHISKY SLIDE.—*Chronicle*, Dec. 7: The bonders of the Whisky Slide mine, which has been lying idle for some time, have commenced cleaning out their tunnel preparatory to their commencing work on an extensive scale. Water has stopped operations on the Tumwalt mine. It is rumored that San Francisco will start up the Hoosier and Horse Thief. The Brady, on Jesus Maria creek, about two miles above the town of Jesus Maria, is also idle.

MINING IN GENERAL.—*Chronicle:* Hydraulic mining still languishes for want of water. The "Bonanza," Moses and Co., proprietors; Mammoth," owned by Veith, and the "Eureka," the property of Cook Bros., are being actively worked, and are taking all the water there is to spare for hydraulic purposes. All the other hydraulickers are wanting water. With the tunneling and milling claims, times are a little brisker. Brown & Co., Querel & Co., Johnston and other tunnel miners are working away briskly and with uniformly good results. The Rough Diamond mill is also running part of the time and Hoey & Sliter's battery is kept in constant operation.

EL DORADO.

KELSEY.—*Mountain Democrat*, Dec. 7: Everything about the Gold Depoeit is as lively as ever. The work is carried on by from 12 to 15 men, all residents of this county. The shaft is now down 65 feet, showing a large, well-defined lode. A level has been started from the bottom of the shaft, south, which is now in 10 feet. The ore in the level is equal to, if not better than that in the shaft. The mill is kept constantly running night and day, but it will take some time yet to get the platform clear of rock, so that they can commence on the ore outside. The furnace for roasting the sulphurets will soon be completed, when the work of reducing them will commence. There is some talk of another mill being put up on the Morning Star mine, which is about one mile north of the Gold Deposit. There are other parties prospecting in the immediate vicinity, who show the best results.

MCNULTY.—This mine is prospecting well, and a mill is to be erected for crushing the rock.

INYO.

BROWN MONSTER.—*Independent:* This is the new name of the old Eclipse property now being opened under the general management of Capt. Eudey. A strong force is engaged in extracting ore under contract, and the dumps are piled full of much richer ore than the old mine was ever supposed to yield. A 2,000-foot steel cable has just arrived, to be used in shipping ore down from the mine to the head of the tramroad. It is stated that the mill will be started up on the 17th inst.

BENTON BULLION.—The Comanche mill at Benton is still running on ore from the Tower mine, which is of high grade and improving as depth is attained. On the 15th ult., a shipment of $10,468.53 was made, and on the 23d three bars, valued at $5,286.99, were sent.

MARIPOSA.

THE MINES.—*Gazette*, Dec. 7: The Hite mine to-day is more valuable than ever before, for time and labor have demonstrated the fact that it is inexhaustible—that it contains gold-bearing quartz enough to last for the next generation, at least. A shaft has recently been sunk 100 feet below the lower level, which shows a strata of ore four and a half feet thick, that will, judging from specimens shown us from the bottom of the shaft, assay fully $1,000 per ton. This shaft, going as it does down from the lower level, proves conclusively that the rich body of ore is very large. Various rumors have been in circulation for some time past, concerning the sale of the Hite mine, but there is no evidence on record that a sale has been consummated. The mine next in importance to the Hite is the Georgia Point, located on the point of ridge running down from the divide between the two rivers to the South Fork of the Merced, and about 2,000 feet easterly from the Hite mine, and is deemed an extension of that lode. Considerable prospecting has heretofore been done on the Georgia Point vein, and good paying ore found, similar in character to that of the Hite lode; but the working of the vein necessitated an outlay of considerable capital before developments could be made or any profit realized therefrom. A short time since a company was formed in the State of Connecticut, styling itself the South Hite mining company, which has purchased the Georgia Point mine, and through its agent, Mr. W. E. Brown, has taken possession, and the preliminary labor of erecting buildings and running tunnels has earnestly begun. Quite a number of miners are already employed in running some three or four tunnels, two of which will strike the vein with 500 and 700 feet. There are many other gold-bearing quartz veins in this vicinity that have not been developed, or even had a pick stuck into them.

MONO.

We clip the following from the Bodie *Standard*, of Dec. 4th:

BODIE.—The new shaft has been sunk 13 feet during the week; it is now 35 feet below the station, and has attained a total depth of 241 feet. There is nothing special to note in the appearance of the mine. The stopes are all looking well. The ore is of the same average quality as heretofore. The mill is running steadily.

STANDARD.—The east crosscut from the Mono shaft is in 50 feet; progress for the week seven feet. The face is in good blasting porphyry. The south drift from this crosscut is in 33 feet; the ledge is two feet wide. The south drift from the west crosscut is in 48 feet; the ledge is three feet wide. The West Standard south drift is in 195 feet; progress during the past week, 30 feet; the ledge is three feet wide, of very rich ore. There is no particular change in the stopes. The mill is running well.

MONO.—The east drift on the 260 level is now in 46 feet, the face in hard porphyry, carrying numerous seams of quartz. It is expected that the ore vein will be reached in a further distance of about 50 feet. Work has been resumed in the shaft which is now 285 feet deep. A strong and well-defined quartz vein, about three feet in thickness shows in the bottom, giving low assays. Large supplies of wood, charcoal, lumber and mining timbers are now coming in, and everything will be in shape for vigorous prosecution of work during the winter. The safety cage is now in, and greatly facilitates work in the mine.

CHAMPION.—The main shaft has attained a depth of 460 feet, and we are pleased to learn that the formation has changed entirely and looking favorable. The west crosscut is now in 208 feet and looking well, and stringers of quartz are coming in. The east crosscut is new in 139 feet, and looking well. We learn that the Champion will open a station at 500 level, and both the Bruce and Burgess veins of the Bodie mine are continuous.

BODIE TUNNEL.—From the mouth to the face the tunnel has reached a length of 615 feet, with work still being pushed forward. As progress is made indications show an improved appearance in formation, and important developments are expected at any time. Among mining men of intelligence and knowledge of the country, the Bodie tunnel is a favorite enterprise and will do as much as any other work now being done to thoroughly develop the mines of the district.

SILVER HILL TUNNEL.—*Chronicle*, Nov. 30: In company with Thomas Steel, we visited the workings of the above company yesterday. Entering the tunnel, situated south of the Aurora tunnel on Silver hill, we passed through the best of timberings. The tunnel will gain a depth of about 300 feet beneath the summit of the hill. A distance of 450 feet has been accomplished, cutting through numerous strata of clay and quartz, and a ledge of decomposed quartz and clay eight feet in width, which prospects well. The tunnel is four by six feet, and has been worked unceasingly since the commencement on August 8th last, and we are assured that work will be continued throughout the winter. A great amount of dead work has been done and capital expended in prosecuting the work. Important developments may be looked for at any time, as the prospect for intersecting the Bodie and Standard veins is evident. We predict for this enterprise a bright future.

MARY ANNE.—This claim is one of the oldest and most promising mines on Silver hill, being situated on the west side, and near the summit of the hill, 1,500 feet south of the Mono. The ledge is two feet wide of $30 ore. The work done consists of an inclined shaft on the ledge, 60 feet in depth. It is the intention of the owners of this valuable property to resume work on it at an early date. It is owned by William Irwin, Jr., Thomas Steel, and others.

NEVADA.

The following is from the monthly review of the Grass Valley *Union*, Dec. 4th:

IDAHO.—During the past month there has been a general improvement in the Idaho. The 9th and 10th levels are being carried into the east country, on a strong and good ledge, and the new shaft below the 10th level is carrying a ledge of four feet in width of excellent ore. Everything about the mine is in excellent working condition, and the head of 50 stamps in the mill are kept constantly running. The yield of the mine for the month of November was $57,000. The regular monthly dividend of $7.50 per share, amounting to $23,250 was declared on the 2d inst., payable immediately. This is the 112th dividend declared during the life of the mine, aggregating $2,533,750.

CENTENNIAL.—During the month the 3d level, 420 feet on the incline, has been extended both north and south, showing a good ledge all the way. Drifting and stoping is also going on on the 2d level. The mine continues to open out well and give assurance of permanency and profit. On account of the necessity of laying in the winter supply of fuel, and the danger that storms may interfere with the hauling of quartz to mill, the company has concluded to pass a dividend for the present month. The condition of the treasury would warrant the payment of a dividend were it not for these contingencies. A crushing of 160 loads of company and tribute rock is now being made at the Orleans mill, which from the appearance of the plates will not pay less than $9,000.

GOLD HILL.—The incline has been sunk under the new contract, 170 feet below the fourth level. The shaft carries a good-sized ledge all the way, but the character of the rock has not been such as to justify opening a new level. Lately, however, quite a healthy improvement is noticed in the appearance of the rock, which shows well in sulphurets. On the completion of the present contract a new level will be opened. Three tribute companies are at work on the 2d and 4th levels.

ROCKY BAR.—A perpendicular shaft is being sunk to the north of the hoisting works, as the ledge in this direction shows signs of improvement, and it is believed that the north ground will be found better than that which has been worked on the south end of the location. The last crushing paid from $35 to $40 per load.

NEW YORK HILL is yielding good ore, and the mine has been showing a stronger ledge than it did a month or more ago. The last crushing of rock at the Omaha mill paid $80 per load.

FRANK MORSE'S ground, situated on the same hill, shows well as the rock is impregnated with fine sulphurets and free gold. The work of sinking the shaft deeper has been commenced.

MARTIN BEAN & CO.'S MINE, situated on King's hill, about 35 loads of rock on the dump shows well in gold and sulphurets—ledge from 12 to 18 inches.

SHASTA.

AFTER THE FIRE.—Reading *Independent*, Dec 5: Workmen are clearing the rubbish at the old Afterthought mill, Furnaceville, and preparing to erect the new mill. Timber and lumber for the purpose are arriving. The old shafting though warped can be fixed over. Some of the light iron works are damaged to such an extent that it will be necessary to replace them with new material. The battery works are in a very fair condition; the powerful little Turbine is all right. Mr. O'Hara still remains, and has experimented upon the ores to such an extent that he is satisfied that his process will work to perfection the minerals of this district.

COPPER CITY.—All kinds of mining operations are progressing finely in this camp. The Extra Co.'s mill is constantly reducing ore, which continues to yield good results, and they keep up their regular shipment of bullion, which is the best proof of what is being done. The Potter mine is improving rapidly, showing a beautiful vein of very uniform ore, which ranges from 7 to 10 feet in thickness from the top to the bottom of the shaft, which is 120 feet deep, with well-defined walls on both sides, which proves it to be a true fissure vein. The ore produced from this mine runs about $40 per ton assay, and varies but little in appearance or value from top to bottom of the main shaft. The Jennie June mine, which joins the Potter mine on the north, has been sold by Mr. Sallee, and bids fair to become one of the best mines in this State, as it has an ore body 14 feet thick with an average assay of $35 per ton; and the ore is very similar to that of the Potter mine. Work is being pushed forward rapidly at the Northern Light mine, and when they cut the ledge with their present tunnel, they will have their mine opened in fine shape, enabling them to produce an unlimited amount of rich ore which is known to exist in this mine, as the ore taken from the upper tunnel is known to be of a very high grade, averaging assays of $40, and frequently finding samples going well up into the hundreds. The tunnel at the Winthrop Co.'s mine is being pushed forward as fast as possible, and will reach the ledge in a short time. This company will build a mill next spring.

TUOLUMNE.

MILLS.—*Independent*, Dec. 7: The new quartz mill on the Evans mine will be finished, and in running order inside of 15 days. The iron work is being done by the Sonora foundry. The mill will be a counterpart of that on the Harris mine at Jamestown, which is the prettiest working mill in Tuolumne county. The mill on the "Hunter" mine is nearly complete.

NEVADA.

WASHOE DISTRICT.

CALIFORNIA.—Gold Hill *News*, Dec. 11: At the 2150 level the station is nearly completed ready to start a drift northward to connect with

Insanity and Crime in Mining Countries

An address dellvered by Hon. ALEX. DEL MAR, Late Director U. S. Bureau Statistics, Statistician of the U. S. Silver Commission, Supervisor of New York Census, etc., before the California Academy of Sciences, December 3d, 1878.

Mr. President, Ladies and Gentlemen:—Only those who have lived in gold and silver mining countries can fully understand the powerful influence which the hazardous industry of mining exercises upon the moral welfare of the surrounding community. The almost universal passion for gambling, whicb it excites and encourages; the extraordinary freaks of fortune wbich it gives rise to, when, sometimes, and in the course of a few months the most indigent and illiterate of the community are lifted into opulence and power, while the well-to-do and intelligent are reduced to unexpected poverty and obscurity; the licentiousness of the *noveau riche*, and the grief and despair of the unlucky and disappointed; all these are social features peculiar to mining countries, whose broad and deep mark to be appreciated, must he seen with the observer's own eyes.

A continuous residence of more than two years in California, has satisfied the present writer that, at least in San Francisco, which contains one-third of the entire populatiou of the State, there are few persons of an adult age who are not at some time or other directly interested iu the mines; aud this is probably also largely the case throughout the State generally, and also throughout Nevada and the remaining portion of the North Pacific slope. The miners themselves, who, now that the placers are exhausted, are, for the most part, workingmen upon daily wages, are probably the least interested of any class in the vicissitudes of the miues. But down to the very boot-blacks and servant-girls, there are few others of whom the same can he said. When a new ore discovery is made, or is expected to be made—and this occurs not unfrequently—all kinds of productive labor are abandoned for tbe superior attraction of the stock exchange and the broker's office. At these centers of activity, can be seen, npon any day, thousands of men and women, the latter chiefly of the lower classes, trades-women and domestic servants, waiting for that turn of the wheel of fortune, which shall bring them opulence and ease. Little hoards are withdrawn from savinge banks and other receptacles, and eagerly exchanged for ehares in looked-for honanzas, aud when the prices of the latter advance so as to place them beyond the reach of the purchaser with limited means, the shares of other properties, often so obviously worthless as to he openly and generally alluded to as "wild-cats," are purchased with the same eagerness, and paid for in coin wrung from the sweat of labor and subservience.

Upon the passion thus aroused and the credulity which it fosters, there are not wanting classes to prey and thrive. Falee or exaggerated reports of ore discoveries, delusive tricks and plants in and about the mines, stock deals and jobs concocted to deceive investors; wash-sales and bull and bear movements on tbe etoek market, the employment of stool-pigeons, point-givers and cappers; in short, all the devicee knowu to the jockey and the blackleg, are brought into active play. The common result is loss and despair to the deluded investor and fortune to the conspirator. And yet the few prizes snatched from this fire are so fascinating that no degree of general loss appears to be sufficient to deter new aspirants for fortune. There is scarcely a class of the community who do not play some part in this drama. The conservative merchant or hanker who lends money npon this or that stock or withdraws the often designedly accorded credit; the leader of fashion wbo confidentially imparts the exclusive intelligence concerning some mine to his or her circle of dearest friends, which, in most cases, is certain to ruin them; the fiduciary who horrows from his trust fund, merely for a few days, until he can realize the enormous profit promised by an impending rise in etocks and pay back the dishonestly abstracted money; the clerk who is tempted to seek fortune through the humhler medium of his master's till; the poor shop-girl whose virtue falls an easy prey to the powerful allurements of wealth, and is then employed as the medium for trapping other victims; all these and many other classes are cast in the dangerous and demoralizing pursuit of eudden wealth from the mines.

At the present writing there are four exchanges in San Francisco, all of tbem devoted exclusively to mining stocks.* So small a quantity as five shares of stock is commonly dealt in, and cases are known where a single share, nay, one-balf of a ehare, was bought and sold. The prices of the stocks range from $1,000 down to five cents a share, so that the smallest speculator can he accommodated.

So universal has stock gambling become in California that mining stocks take the place of the weather in other countries and have become the commonest theme of conversation, alike in the politest circles and the obscurest retreats. Indeed, one can learn, after a brief residence on the coast, merely by observing the faces and demeanor of those who throng the neighborhood of the exchanges, whether the "market" is up or down.

That in a community thus engaged and constituted—and the same may be said of the mine-owuing towns of Mexico and Australia—insanity and crime should prevail to an unusual extent is only what should naturally be expected. The intellect is not proof against the sudden changes of fortune induced by the hazard of gold and silver mines aud the sudden and tremendous fluctuations in their value; nor are the passions subject to tbe same control that distinguish them in communities occupied in safer and more sober pursuits. The evidences of these aberrations of mind, this violence of emotion, which distinguish mining countries, are to be found in every direction. It will suffice for the purposes of this paper if two of the principal ones are selected for illustration. These are insanity and suicides.

In arranging the evidence of insanity, it is primarily necessary to distinguish between this mental derangement and idiotcy—the former being "the product of society and of moral and intellectual causes," and the latter "a state depending on soil and material influences." Next, an allowance must be made for the number of insane in private families, or at large, and not confined in the asylums. According to the voluminous, though far from critical, report, of Dr. Wilkins to the Governor of California, France is the only country whose statistics, as quoted, distiuguish the insane and idiotic, severally, in asylums and at home. The year selected for illustration, 1861, happens to he that one when the official figures were, for the first time, substantially correct. Of this we are assured by tbe *Statistique de la France*;* the same work on a previous page giving the number of insane under treatment in France at various recent periode as follows :

	1851	1856	1861
In Asylum	21,353	25,485	30,239
At Home	24,433	34,004	53,160
Together	45,786	59,499	83,399
Population of France	35,783,170	36,139,364	36,717,254
Insane to Popult'n, 1 in	781	607	440

The increase of insanity, apparently shown here, is due for the most part to the increased completeness of the returns, evidenced by the augmenting proportion of insane treated at home. This, at the latest date, was 175 to 100 in asylums.

The statistics of insanity in the United States are obtained for the federal censue from the reports of asylume. They are somewhat defective as to numbers in private asylums and do not make any allowance for the numbers treated at home. With an estimate of the latter, based on the proportions exhibited in France, the statistics of the United States are as follows:

	1850	1860	1870
Whites in Asylum	14,257	23,593	35,610
Estimated at Home	24,950	41,288	62,318
Together	39,207	64,881	97,928
White Population	19,553,008	27,461,813	33,589,377
Insane to Popult'n, 1 in	498	423	343

The estimates on the second, third and fourth lines for the year 1860, include free colored persons who are not distinguished from the whites in the census compendium of that year. The proportion of free colored is little more than 1%. All of the above numbers include California.

The black, formerly the slave, population of the United States, is omitted, because, while idiotcy is quite common with this race, insanity is rare, and their incorporation into the table would render it misleading.

Here again the numbers and proportions exhibit increase since 1850, and show that in the United States generally insanity is half again as prevalent at the present time as it was 20 or more yeare ago.

Let us now ece how the case stands in California, considered hy itself. In this State there are no private asylums. The official returns of insane at Stockton and Napa include a few idiots—according to the federal census of 1870, only 14% of the whole number—and to that extent the comparison which will presently be made is vitiated, certainly for one year, and probahly, to more or less than this extent, for all yeare:

Close of Fiscal Year.	In Asylums at Stockton and Napa.	Estimated at home: Proport'n as in France.	Together.	Population of State.	Insane to Popult'n, 1 in
1850	22	780	1,147	165,000	2,750
1860	417	3,213	1,906	379,994	331
1868	698	1,346	2,115	470,400	250
1867	769	1,493	2,340	500,039	239
1868	853	1,610	2,530	518,000	221
1869	920	1,832	2,870	538,000	213
1870	1,047	1,870	2,917	560,247	192
1871	1,090	1,908	2,998	582,400	194
1872	1,123	1,965	3,088	605,700	196
1873	1,156	2,023	3,179	630,000	198
1874	1,204	2,154	3,358	651,400	194
1875	1,232	2,279	3,511	675,700	192
1876	1,492	2,490	3,982	705,700	177
1877	1,590	2,783	4,373	737,000	168

These numbers include wbite and other races; hut as the latter form only a small proportion (10%, mainly Chinese) of the whole population of the State, it has not been deemed worth while to exhibit their statistics of insanity separately. The proportion of Chinese insane is less than 5% of the whole number.

The uncertain factor in this table is the proportion of insane not in the two asylums at Stockton and Napa.

The proportion estimated is derived from the statistics of France, where, wealth being less equally distriluted, and the police more scrutinizing, it is to be presumed that this proportion, great as it is, is less than in California.

As tbese statistics do not show the number of new persons afflicted eacb year, but only show the whole number remaining afflicted at the close thereof, and as the population of France, the United States and California, respectively, are of different ages, there is other room for errors, when the tahle is used for the purpose of international comparisons. But these uncertainties and discrepancies are not important in the present connection.

Unmodified hy these considerations, it appears tbat among the white race in France insanity is the condition of one in 440 of the population; in the United States, generally, 1 in 343; in California, by itself, 1 in 168. In other words, insanity appears to he twice as rife in California as in the United States, and more than twice and a half as rife as in France.

The number of new commitments for insanity each year since 1866 may serve, in some measure, to indicate the causes of thie extraordinary and sorrowful exhibit:

Fiscal Year Ended June 30th.	Commitments to Stockton & Napa Asylums	Population of the State.	Annual Commitm'ts to population, 1 in
1866	279	476,409	1,707
1867	313	500,039	1,597
1868	387	518,000	1,338
1869	432	538,000	1,116
1870	562	560,247	997
1871	523	582,400	1,112
1872	506	605,700	1,197
1873	401*	630,000	1,177
1874	524	655,200	1,250
1875	615	681,400	1,108
1876	735	708,700	964
1877	652	737,000	1,130

*Nine months to June 30th.

From 1848 to 1865, inclusive, a period of 18 years, the whole uumber of commitments to the State asylums for the insane was 3,169, or an average of 176 per annum; while from 1866 to 1877, inclusive, a period of 12 years, the commitments bave been 5,979, or an average of 498 per annum.

The former may be regarded as the era of the placers, when few besides those who worked in or about the mines were subject to their vicissitudes, and when death soon closed the career of the unfortunate adventurer, and ehielded him from the milder visitation of insauity. The latter is the era of the vein-miues, of mining incorporations, and of gambling made easy by mining shares and stock-markets. It is not difficult to infer that these causes have had much to do with the great increase of insanity shown by the statistics adduced; an inference that becomes greatly strengthened npon turning to the statistics of suicides in Sau Francisco.

These statistics, it must be remarked, are very defective. Until lately no attempt had been made at the Coroner's office to construct tables of suicides, comparing one year with another, and nothing beyond the most indifferent effort to ascertain their causes. Much improvement in these respects has lately taken place; hut etill many suicides are not reported. These consist mainly of persons who drowned themselves in the bay, and whose bodies are not recovered, and brought under the notice of the Coroner, and of Chinese, the deaths of whom in San Francisco, from whatever cause, are reported as due to "unknown" causes.*

Another class of omissions is of persons belonging to the city, who may have committed suicide beyond its corporate limits. In such cases the Coroner of the city has no supervision, and makes no mention of them. Some of these, not all, are included in the reports of the Health Officer.

From the records of these two officials, and, when they disagree, choosing the bigher number as the more nearly correct, we have the following comparative results:

Reported Numbers of Suicides in San Francisco.

Year.†	*Suicides.*	*Year.*†	*Suicides.*
1860	31	1870	47
1861	130	1871	51
1862	13	1872	37
1863	18	1873	38
1864	20	1874	61
1865	17	1875	64
1866	24	1876	70
1867	29	1877	76
1868	28	1878	102
1869	39		

† Ended June 30th.
‡ Estimated.
‖ Estimated from returns of 9 months. The returns for the years 1867, 1868, 1872, 1874, 1875, 1876 and 1877 are from the Health Board returns; tbe others from the Coroner's. The latter's summary report for 1878 gives, on p. 124. the following numbers for each year; commencing with 1863, viz. : 17, 20, 16, 20, 28, 20, 43, 44, 44, 45, 37, 59, 60, 56, 75 and 103. Total reported in 16 years, 687. Chinamen are not included in any of these numbers, except where, very rarely, a Chinaman is specifically reported to have died from self-destruction. Inquests are held upon the bodies of Chinamen dying from unknown causes.

Any comparison of these numhers with the reputed population of the city in any other years but those in which a census was taken, is considered hazardous, on account of the tendency to exaggerate the numher of inhabitants, which is common to the growing cities of the United States, and appears in all the publications relating to them, except the census itself. The only years of the series above shown, in which a census was taken in San Francisco, were 1860 and 1870, when the population was, respectively, 56,802 and 149,473.

The least objectionable means of determining the relation of the number of suicides in San Francisco to that in other cities, is to compare hoth of them with the whole number of deaths iu each place. Without burdening this paper with details which would probably weary the reader, it is deemed sufficient to say, that, determined in this way, suicides are more than twice as common in San Francisco as in New York and more than thrice as common as in Philadelphia. It is the present writer's belief, that, as compared with population—could the latter be satisfactorily determined as to San Francisco—the result would appear still more unfavorable. It is also to be remembered tbat this result is only given with reference to the number of the reported, not the true, number of suicides in San Francisco. Giving due weight to this consideration, it will probahly be not far from correct to regard the proportion of suicides in San Francisco, either to all deaths or to population, as fully three timee as great as in New York, where suicide is a much more common crime than any where else in the United States.

An inquiry into the probable causes of such an extraordinary preponderance of suicidee is bound to be heset with obstacles. When the predisposing, nay, even the immediate causcs of self-destruction defy, as we know they commonly do, the scrutiny of a legal inquest, there would seem to be little hope of determining them from that more general sort of evidence which is to be found in other ways; and, but for a personal knowledge of the habits of life common to several mining countries, the present writer would hesitate to indicate them. In his report for the fiscal year ended June 30th, 1878, the Coroner of San Francisco reports 35 casee as caused by pecuniary and seven by unknown motives; three of the former he directly traced to stock gambling. Intemperance, iusanity and unsound mind cover 21 more cases. All of these cases and many others attributed to various causes may have been, and probably were, due either to gambling in the mines or the absence from home and friende, which forms a condition peculiar to mining countries. This probability is greatly strengthened by the causes of the suicides, covering a portion of the same period, which were reported by the daily press. During the calendar year ended Decemher 31st, 1877, the following suicides, with their supposed causes, were reported iu the San Francisco *Chronicle:*

Assigned or Supposed Causes of suicide.	Males.	Females.	Total.
Losses in mining stocks, etc.	20	2	22
Insanity (cause not stated)	5	0	5
Intemperance (cause not stat'd)	12	0	12
Incurable disease	7	0	7
Love	4	3	7
Ill treatment	0	2	2
Religion	1	0	1
Remorse for murder	1	0	1
Unknown (or not stated)	24	3	27
	74	10	84

Among the conditions that influeuce suicide, there are none except mine-gambling and the separation from home and familiar faces, which is peculiar to mining communitice and especially those of recent growth, in which San Francisco does not enjoy advantagee which should exempt it from this crime. The city is exceptionally healthy. It is purified hy seawinds that blow every day; its foundations are laid in clean dry sand; it is hilly; it has a good drainage, and is washed by a vast bay on the oue side and the ocean on the other. The climate is dry, temperate and steady. Food of every description is plentiful and cheap; all the other necessaries of life are to he obtained on the same terms as in other cities throughout the United Statee, while labor is ordinarily in demand and commands a higher price than elsewhere. Hence in looking for tbe causes of this great and peculiar mortality, the inquirer is led at once to the subject of the mines.

Before the civil war the number of suicides committed annually in San Francisco was about 30. During tbe war—and this period also agrees with the opening and development of the great Comstock mines—when great profits, rising prices and abundance of employment for the industrial classes preserved them from those temptatione to self-destruction which find their origin in necuniary difficulties, the annual average fell to 17. When the war closed and the Comstock mincs came to be incorporated into stock companies, suicides resumed their former frequency, aud during the four years ending with 1869 the annual average became again, as before, 30.

The ensuing four years witnessed the opening of the great Crown Point and Belcher honanza, and the first series of gigantic stock speculations and jobberies which distinguish the annals of the coast. During this period the average annual number of suicides rose to 43. In 1874, while the Crown Point and Belcher bonanza were still yielding at the rate of $18,000,000 a year, the Big Bonanza was struck in the Con. Virginia and Californiа mines, and this added some $5,000,000 to that year's production of the precious metals, and proportionately increased the pre-existing excitement and the practice of jobhery. From this time forward until 1877 the Big Bonanza continued to increase its product, to augment the predominant mania of the coast, and to afford additional support to the resourcee and devices of jobhers.

In the last-named year the faot was disclosed

*These are the San Francisco, the Pacific, the California and the People's.

* Par Maurice Block, Paris, 1875, vol. I, p. 303.

*Report of the Coroner for 1878, p. 5: The Chinese in San Francisco number about one-tenth of the population; and although they uearly all consist of adult males in the prime of life, while the whites consist of both sexes and all ages, the whole number of Chinese deaths is in about the same proportion.

that this great ore-body had passed its point of highest production. Then followed a tremendous collapse in all mining shares, numerous bankruptcies, a fall in real estate, rents, commodities and wages, popular tumults, and numerous misdemeanors and crimes; among the latter an unusual number of suicides. Taking together the five years ended June 30th, 1878, the number of suicides reported to have been committed in San Francisco reached the unprecedented annual average of 75.

It is impossible to believe that these occurrences were not connected. This conviction is strengthened not only by the statistics of commitments for insanity hereinbefore given, but also by the statistics of deaths by violence, crime, immorality* and disorder of every sort, by the accounts of the savings banks, by the returns of bankruptcies, and by the prevalence of indigence and suffering among those classes of the community who did not profit by these speculations or succumb to the blow which they inflicted on the losers.

* The number of divorces decreed in San Francisco in 1876 was 253, and in 1877 it was 243.

The Martin White Case.

[Continued from last week.]

The Marking of a Center Line

In a district where the extent of a claim on each side of the center line is established by the local rules? It would be safer and therefore better to comply with the recommendations of the Land Office and erect stakes at the corners of the claim, but if the grand object of the law is attained by the marking of a center line we can see no reason why it should not be allowed to be sufficient.

In this case the locators of the Paymaster marked the center line of their claim on the 10th of October, 1872. No miner, no man of common intelligence acquainted with the customs of the country, could have gone on the ground and seen the monument, notice and work at the discovery point and the two stakes —one 300 feet southeast of the location monument, marked "Southeasterly stake of Paymaster," the other 1,200 feet northwest of the location monument and marked "Northwesterly stake of Paymaster"—in a line with the croppings and the discovery point, without seeing at a glance that they marked the center line of the claim. By the rules of the district and the laws of the land he would have been informed that the boundaries of the claim were formed by lines parallel to the center line and 300 feet distant therefrom and by end lines at right angles thereto. With this knowledge he could have traced the boundaries and, if such was his wish, ascertained exactly where he could locate with safety.

The Paymaster Sufficiently Marked.

We conclude, therefore, that the Paymaster location was sufficiently marked on October 10th, 1872. At that time the Shark location had not been marked in any way, and whether the law allows a locator a reasonable time or not to mark his boundaries—protecting his full claim in the meanwhile—the same result equally follows. If the Paymaster was not marked within a reasonable time after discovery, then certainly the Shark was not, for the first was marked within three months and the latter not until more than eighteen months after discovery; so that the Shark claim was lost by the failure to mark its location within a reasonable time, and such time is allowed, then the Shark was thereby excluded. If no time for tracing is allowed, and the first to mark his boundaries is first in right, then the Paymaster location holds the claim, because it was first defined by monuments on the ground.

Unless the Paymaster location failed in some other particular to comply with the law, there is no hypothesis upon which anything can be claimed under the Shark location.

Regarding Notices and Records.

But it is contended that the Paymaster location was rendered invalid by non-compliance with the rules of the district and the law of Congress respecting the notice and record of claims.

There is no doubt that in order to secure the right of possession to a mining claim there must be a compliance not only with the laws of the United States, but also with such local regulations of the mining district as are not in conflict therewith (R. S., 2324), and if the miners of the Ward district have made the posting and recording of the location notices essential, the courts are not at liberty to dispense with them.

The original laws of the district were adopted May 1st, 1872, ten days prior to the passage of the Act of Congress, which, as we have seen, introduced an entirely new system of making locations—a system in which the preliminary posting and recording of notices is entirely out of place, except as a means of protecting a claim during the time necessary for tracing the ledge and marking the boundaries of the location. When the location is thus marked, all that the notice and record were intended or expected to accomplish is effected in a manner far more satisfactory and complete. In place of a very imperfect, and often misleading, notice of what was claimed, there is a plain and unambiguous notice to all the world of the exact position and extent of the location. It might well have been held, therefore, with respect to the rules adopted May 1st, 1872, that their requirements as to the posting and recording of notices were superseded by the act of Congress of May 10th, 1872; that they were merged in the higher and more efficacious rule of the statute, or, at least that, if they continued of any force whatever, it was only as a means of protecting a vein discovery during the time reasonably necessary for tracing its course and marking the boundaries of the location, and, consequently, that if the discoverer chose to mark his location in the beginning, or actually did so at any time before an adverse claim was made, his failure to post and record a notice would count for nothing.

Useful Information.

Statistics of Increase in American Exports.

President Hayes in his Cumberland speech, said: "What have we sent abroad? Take the article of corn. Six years ago we exported 34,000,000 bushels, now 85,000,000; wheat, 26,000,000 bushels, now 72,000,000; flour, 2,500,000 barrels, now 4,000,000; cotton. 933,000,000 lbs, now 1,607,000,000; bacon, 246,000,000 lbs, now 592,000,000; fresh beef, 26,000,000 lbs, now 92,000,000; pork, 57,000,000 lbs, now 71,000,000. The total increase in six years is about $140,000,000." The official statistics of the first eight months of 1878 also show that there has been a great increase in the quantities and values of the food exports of the present year, as compared with the corresponding exports of 1877. The quantity of Indian corn exceeded 66,000,000 bushels, as against a little more than 51,000,000 bushels; wheat rose from a little less than 17,000,000 bushels in 1877 to nearly 57,000,000 bushels in 1878; wheat flour increased from 1,608,635 barrels to 2,935,806 barrels; and the increase in nearly every staple export, classified under the head of provisions, was equally marked—the exports during the first eight months of 1878, of a few leading articles, being as follows: Bacon and hams, 479,627,519 lbs, valued at $38,737,611; cheese, 102,649,756 lbs, valued at $10,218,364; lard, 254,770,780 lbs, valued at $21,142,257.

Of 12 leading classes of articles, the exports increased $262,899,614 in value, from the fiscal year ending June 30th, 1868, to the fiscal year ending June 30th, 1878. The classifications named and gain, during 10 years in the value of the exportations, were as follows: Agricultural implements, $1,901,817; live animals, $5,111,258; bread and bread-stuffs, $112,793,510; coal, $843 247; copper, brass, and manufactures of, $2,139,099; manufactures of cotton, $6,564,574; fruit, $970,457; iron, steel, and manufactures of, $5,694,619; leather and manufactures of, $6,663,289; oil-cake, $2,181,715; coal oil and petroleum, $24,764,298; provisions, $93,271,733. In this list one of the most remarkable gains was in provisions, which quadrupled, rising from $30,278,253, in 1868, to $123,549,986, but it found a fitting parallel in the gain in the exports of breadstuffs, which increased from $68,980,997 in 1868, to $181,784,507 in 1878.

Population of Some of the Great Cities of the World.—The Registrar General of London, in one of his weekly reports, gives the population of the cities of the world having over a quarter of a million of inhabitants, as follows: First comes London, with its 3,577,304 people; next is Paris, with its 1,988,806; New York, with its 1,084,528, and its close neighbor or partner, Brooklyn, with 549,438; and then Berlin, with 1,019,620 inhabitants. Philadelphia has its 876,118; Vienna, 727,271; St. Petersburg, 669,741; Bombay, 644,405; Glasgow, 566,940; Liverpool, 532,581; Manchester, with Salford, 530,765 people. All these are above the half million. Then comes Naples, with its 457,407; Calcutta, with 429,535; Madras, 397-552; Hamburg (the State), 405,104; Birmingham, 383,117; Baltimore, 355,000; Buda-Pesth, 319,350; Dublin, 314,666; Leeds, 304,948; Amsterdam, 302,266; Sheffield, 289,537; Rome, 282,214, and Breslau, with 267,000 population. He seems to omit the great Chinese and Japanese cities.

Marble Cements.—A composition of gumlac, colored to suit the occasion, is sometimes used. The rust cement is also used, composed of hydrochlorate of ammonia, 2; flour of sulphur, 1; iron filings, 16. For coating inside of cisterns: Pulverized baked bricks, 2; quicklime, 2; wood ashes, 2; olive oil to make a paste. For stone seams and joints: pulverized tiles or hard brick, 6; whitelead, 1; litharge, 1; oil to compound. Another cement is as follows: Hydraulic cement, 12; triturated chalk, 6; fine sand, 6; infusorial earth, 1; all mixed with soluble soda glass.

Depreciation of Coal by Storage.—A case having come before the Bohemian courts, it was found that bituminous coal stored 12 months depreciated as follows: 1. English Peases West coal suffered no depreciation. 2. Ihhenhneren, Westphalian coal lost 1.4% in weight, 6% in calorific value, and made 4.6% less of coke. 3. Dortmund coal lost 2.6% in calorific value and made 2.1% less of coke. 4. Gelsen Kirchen coal 0.4% loss of weight, 0.6% loss of calorific value and 2.1% loss of yield of coke. 5. Borgloh coal respectively 2.6% and 0.5%. Experts have testified that a loss of 2% in transportation by cars was not extraordinary for bituminous coals.

What is Steel?

At the opening meeting of the Association for the Advancement of Science (French) M. Fremy spoke of the service rendered different industries by chemical studies, and cited among those especially indebted to scientific research, the manufacture of soda and of steel.

Concerning steel, after passing in review the new processes for the manufacture of this material, the learned professor summed up the principles of the new theory of steelification as follows:

1. There does not exist, as many suppose, an ore of steel; every good iron ore, if properly treated, can produce a good steel.

2d. The steelifying tendency of certain ores is not due to the presence of some mysterious substance, found only in certain privileged minerals, but solely to the purity of the ore and to the method by which it is reduced. A skillful engineer who knows how to eliminate hurtful substances and to supply those which are wanting, can employ almost any of the ores of iron for the manufacture of steel.

3d. If there has not heretofore existed a serviceable steel without carbon we must also remember that the combination of iron and carbon alone will not produce all the steels required in trade.

The steel manufacturer adds in certain cases to the compound of iron and carbon which form the base for steel, certain other substances, such as manganese, chromium, tungsten, cyanide compounds, silicon. These materials augment the hardness, tenacity, temper of the metal, and constitute the different steels of commerce.

Life of Steel Rails.—The *Railroad Gazette* says: The life of steel rails on a trunk line is said to be turning out to be from five to ten years, and the wear of the rails bought of late years indicates that the shorter rather than the longer period named will be their average life. The traffic is probably four or five times as great as the average of American railroads, but still the wear is more rapid than was expected, and more so, indeed, than experience with the rails first laid gave reason to expect. That is, steel rails appear not to be made so durable now as they used to be, and the roads are beginning to see the necessity of making and insisting upon the fulfillment of certain pretty strict specifications as to the quality of the steel in the rails delivered to them. Hitherto there seems to have been no very definite idea of the qualities required for the most durable rail; but there begins to be some knowledge on the subject.

Car and Passengers.—On the Boston and Albany railroad the average weight of the passenger cars is 28 tons, and with the seats filled the load is increased a trifle over seven tons.

Good Health.

Pull up the Blind.

Pull up the blind, Kitty; pull up the blind!
You say, "The sun will spoil the carpet."
Never mind, never mind.

Far better so than that your cheeks or mine
Should lose their worth or color, Kitty,
Let it shine, let it shine.

And you shall find new joy it will impart.
Pull up the blind, Kitty; pull it up!
The sun helps the heart.

—"*Pipes of Corn.*"

Purifying the Blood.

That impurity of blood, says a writer in the *Phrenological Journal*, is the cause of most of our ill-health is well understood by nearly every one; and as evidence of this, we are confronted at almost every step with so-called "medicinal preparations" for cleansing the purple tide of life, and thus restoring the waning powers of the system. So common is the idea that the thousand and one proprietary compounds possess the mysterious power of removing impurities from the circulation, that vast fortunes are amassed in the manufacture and sale of them. From the standpoint of the hygienist the widespread belief in the efficacy of these remedies has no foundation in fact, and the money so freely expended for them is worse than wasted.

The only way that we can remedy the consequences of an imperfect and feeble action of the blood-making organs, is to add to the vitality of the system, and thus give to the weakened organs the power of proper functional work; while we promote the highest activity of the organs of excretion, that as speedily as possible they may remove the useless impurities. The only way to avert the effects of morbid and poisonous materials which shall find their way into the circulation, is to give the eliminative organs the best possible facilities for removing the harmful agencies; while we increase the vital power that shall withstand the attack of evil.

We must learn that we cannot by any means at our disposal take from Nature's hands the work of blood-making; or, with our crude devices, improve upon her handiwork. Proper food in proper quantities, pure air and correct habits of breathing, plenty of healthful and vigorous exercise, a clean skin and a clean conscience—these will do more to purify the blood than all the drugs of the pharmacy. We must build up, not tear down; increase the vital forces, not weaken or destroy them; supply good, wholesome, unstimulating food; not drugs or liquors and tobacco. In short, we must always work *through* Nature, not over or *against* her.

The Advantage of a Clean Skin.

The functions of the skin, says a writer in *Sanitarian*, are too important to be ignored. When we consider how large a share of the fluids and solids that enter the body should find their exit by this great emunctory, together with broken cells, morbific waste, and disintegrated tissue, all of which by obstruction of this organ is thrown back to poison the whole man physically, mentally and morally, we have at once the key to much of the misery that afflicts our race.

Suppose, for instance, the conduits that drain our city and remove the waste from its dwellings are obstructed, how long could the occupants remain in the most palatial mansions. They would have to abandon their homes, or be confronted with disease and death. Every person with an obstructed skin is in similar jeopardy, and the obstruction must be removed, or he must retire from the house he lives in. Perspiration is the safety-valve of the heart, and the sewer of the excretions; and hot-air and its accessories, properly applied, are not only the best protection against disease, but they are among the most efficient means of prolonging life, and of protection against unnatural and untimely death; and in the same proportion that we build with intelligence sanitary structures, and employ them, we may dispense with hospitals and invalids; and in the same ratio we shall prolong useful lives.

Yellow Fever and the Germ Theory of Disease.—Dr. Choppin, of Louisiana, in his address before the Public Health Association recently, said that the germ hypothesis in relation to yellow fever will serve to throw light on some of its devious movements, and strange behavior. Grant that a certain number of the germs is needed to produce sickness; that these germs are reproduced either inside or outside the human body; that they multiply in rapid geometrical ratio by repeated generations at short intervals; that a new generation brought to life in hot weather is not only vastly more numerous, but more energetic individually than its predecessors; that these germs are capable, both of spontaneous locomotion along the ground and other surfaces, and of transportation in the clothing of persons; grant these conditions, which are quite in harmony with the known nature of animalcular beings, and the difficulty of missing links in the chain of evidence is reduced to mere cavilling. Add to this that no germs existed from the previous year to survive the winter of 1877-78, and that there is no suspicion of the introduction of yellow fever this year by other means than that of the *Souder*, and we are reduced to the necessity of fastening the guilt upon that particular vessel, unless we adopt the theory of the spontaneous production of the pestilence from local causes. The nature of these causes no one can explain, even to his own satisfaction, nor why they should exist one year rather than another, or should prevail along the shores of the Gulf of Mexico rather than the shores of the Indian Ocean. The truth is, any other theory of the *materies morbi* of yellow fever than the germ theory is speedily lost in inexplicable mystery.

Sanitary Science.—Mrs. Hobart writes to the *Inter-Ocean* as follows: "The wise mechanic, although impatiently anxious to perform quick work and achieve results speedily, will yet take time to put all machinery to be used in perfect order, knowing that the single drop of oil, promptly applied to prevent friction, is a much more economic expenditure than hours of time and an incalculable amount of patience to mend the machine after it is once broken. Many social scientists begin to realize that, better than legislation, prohibitory or penal, better than reformation and repentance, and all of those expensive pounds of cure, is the old-fashioned ounce of prevention. Give us well-ordered homes, universal sanitary knowledge, and cleanly children, and we believe crime as well as suffering will rapidly decrease Not until we have facts in regard to the number of children starved, abused, or poisoned into crime by poor food, had management and foul air, can we estimate the importance of sanitary science."

Thoughts for Winter.—A writer in the New York *Independent* says: Typhus, typhoid fever, and diphtheria are more abundant in winter than in summer; while, if the specific infective diseases get any foothold in the fall, they are apt to linger with continuous pertinacity until the late spring. It is quite apparent too that our population suffers from the winter confinement amid impure air, even where no special distemper is produced. One reason why it seems so necessary for our urban population to spend the summer on the seashore or in the mountains is just because there has been a reduction of vital force by surroundings, which must be thus repaired. These heated chambers beneath the basement do not send into these household lungs enough of the pure air of heaven. Nature struggles on, with her compensations and adjustments, until she institutes a longing for a change, and so restores the balance, at a disadvantage.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Deep-Mine Pumping Without Pump Rods; Safety Attachments for Mine Cages, 369. The Week; Public Stock Exchanges; Notes on Contributions to Our Cabinet; Hardening and Tempering, 376. Mines and Works of Almaden.—No. 13; A Sheep Protector, 377. Patents and Inventions, 380.
ILLUSTRATIONS.—Angeley's Deep Mine Hydraulic Elevator, 369. Device for Protecting Sheep from Dogs, 377.
MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 372.
NEWS IN BRIEF on page 380 and other pages.
MINING SUMMARY from the various counties of California and Nevada, 373-80.
CORRESPONDENCE.—An Extensive Establishment; Advancement in Mining Stock Gambling and Results, 370.
MECHANICAL PROGRESS.—A German Arrangement for Deep Mine Pumping; Shipping a Steamboat to South America; The Sizes of Bales; Car Planning; Iron Galvanizing Furnace; Washing out Boilers with Hot Water; Mechanical Education; Manufacturing States; Prize Cattle Cars; A Mexican Exposition, 371.
SCIENTIFIC PROGRESS.—Estimation of Phosphorus in Steel and Iron; A Marble-Boring Sponge; Lead as Iodate; Large Fungi; New Notes on Stridulation; Spontaneous Combustion; Geological; Solar and Artificial Heat; American Microscopes; "Science News," 371.
USEFUL INFORMATION.—Statistics of Increase in American Exports; Population of some of the Great Cities of the World; Marble Cements; Depreciation of Coal by Storage; What is Steel? Life of Steel Rails, 375.
GOOD HEALTH.—Purifying the Blood; The Advantage of a Clean Skin; Yellow Fever and the Germ Theory of Disease; Sanitary Science; Thoughts for Winter, 375.
MISCELLANEOUS.—Pedagogic Plunder; Trade Dollars as Bullion, 370. Insanity and Crime in Mining Countries, 374-5. The Martin White Case, 375.

NEW ADVERTISEMENTS.

Brush Electric Light, William Kerr, Agent, S. F.; Elephant Ore Stamp, Edmund White, S. F.; Ottokar Hofmann, Metallurgist and Mining Engineer, S. F.; Delinquent Notices—General Robert Allen, S. M. Co.; Mineral Fork, M. & S. Co.; Land Purchaser's Association.

The Week.

The mining outlook of California still continues unusually cheerful. In Nevada, activity is spreading over the State beyond from the Comstock. The Con. Esmeralda, in Reno district, has a shaft 97 feet in ore, 30 feet of which will mill $75 per ton. Copper mining seems to be assuming importance in Robinson district, the product being sent to Baltimore. Rich discoveries are reported from southern Humboldt and from the neighborhood of the Paradise mines. A strong vein of coal has been found in Coal Valley. From Utah the assertion comes that her yield in the precious metals will exceed that of any previous year, while less lead than usual has been shipped. Silver Reef produces $100,000 per month, and says she could, with capital, produce $400,000. From Colorado, reports are generally good. The *Reveille's* account of Leadville show that this camp is active. The debate as to the permanence of Silver Cliff continues. Such debate is the next thing in order after the discovery of a new deposit. In this case Silver Cliffers seem to have little fear of the decision. Caribou is producing a great deal of good ore. San Juan is wide awake. There is more deep mining in Gilpin county than ever before. In Lake City times are growing livelier. Bright prospects are shown for Idaho. New York capitalists are about to take hold of more of the Banner mines. Greater than any previous winter will be the operations in quartz. Montana has new strikes in old mines, and discoveries of new ledges. And lastly, Arizona is marching steadily forward all along the line.

Public Stock Exchanges.

In large cities, and in any towns of considerable importance, there is always a class of people whose business would seem to a casual observer to be simply seeking after chances to be "gulled." This class, though made in great part, no doubt, of the transient population, or greenhorns, is nevertheless large enough to furnish employment to a larger class of professional swindlers. Society tries to protect the former class, and prevent outrages upon it by the latter class of frauds, by laws against the faro bank and the strap game. But, however absurd it may seem, when the swindle assumes more imposing proportions than these petty games, there is no law to weed it out of the land; it is allowed to flourish in its rank and poisonous growth side by side with some of our greatest institutions.

Among this class of semi-gigantic, petty swindles, belong those establishments known as public stock exchanges, or "bucket-shops." "*Public* stock exchange" is an enticing name. It suggests the idea that a man buying or selling stock through its medium is managing his operation for himself, and is therefore making better bargains and "surer things," than if he entrusts his orders to a broker who belongs to a regular close exchange board. And on the face of it the public stock exchange is, as it appears to its victims, a perfectly fair and legitimate establishment. If there were no underhand performances, such an exchange would deserve no condemnation, further than that it admits of stock gambling in very small amounts, thereby inviting the very smallest earning into its charmed circle, and proving proportionately more demoralizing to the community. But the public stock exchange is not what it appears to be. It is a base fraud, and yet is allowed to exist in the very heart of our city.

This is the way the machine works. A telegraphic "indicator" is fixed in one corner of the large public room. This reports from time to time during the sessions of some of the larger stock boards the market prices of the various stocks, as determined by the purchases and sales in that board. A man tends this instrument, and as the prices are telegraphed he writes them in large figures on a blackboard, the latter being provided with a printed list of the most active stocks, with blank columns after the name of each, for the insertion of the price. The public are allowed to crowd into this room, and watch the changing figures on the blackboard. Meanwhile, if any one wishes to buy or sell, he can make arrangements with clerks that are in attendance, in some such way as the following: Suppose that the price of Alta, on the blackboard, is $5. Suppose the victim, B, decides to purchase 10 shares of Alta on a margin. He goes to one of the obliging clerks and the two contract as follows: B promises to buy 10 shares of Alta at $5 at some time before the price, as indicated on the blackboard, has risen to $7. As security that he will fulfill his contract he deposits with the clerk $5, or 50 cents a share margin. The clerk, on the other hand, promises for the company to sell B 10 shares of Alta at $5, at any time before the price as indicated on the blackboard has risen to $7. Now if the price of Alta rises to $6.50, B can go and present his contract at 5 shares which are worth $6.50, making thereby $1.50 profit per share. So far so good. But suppose the price as indicated on the blackboard sinks to $4.50. The 50 cents per share deposited is no longer security for the performance of the contract. The latter is declared off, without notice being given to B, and the public stock exchange company pocket the margin.

This seems as fair as any stock transaction. B enters it with his eyes open, risking the fluctuations of the market. The rules of the institution appear to be fair enough also. One of them is: "We reserve the right to refuse all orders." However just that may seem, by it hangs a tale. At times the company has in its possession a sufficient number of shares of certain stocks, to affect the market outside by means of "wash" sales. Orders on any other stocks they will refuse. Suppose that they hold considerable Alta, and that a great many victims have, like B, made contracts to buy at $5 before Alta is $7. The train being thus laid, the public stock exchange company set themselves to work to see that Alta shall never go to $7, or anything like it, while these contracts are pending; but, on the contrary, that it shall fall low enough to uncover all the margins so that the company may pocket the same.

They manage to get contracts on just the stock they can manipulate, by judicious use of cappers and stool-pigeons. These talk up that particular stock, make contracts with the company, buy and sell, and great show of passing money back and forth over the counter, and thus lure the victims in. Run by this means scores of men, yes, and women, too, are led to make these contracts, risk their money, and waste their time gazing anxiously from an atmosphere of tobacco smoke up to the face of the blackboard which is to "indicate" almost invariably the utter loss of whatever they may have risked.

Of course if the margins are increased as the stock goes down, they may be saved. But the object of the swindlers is to cause the price to fall so rapidly and alarmingly that the margins cannot be increased fast enough by the class of people that they wish to victimize.

This system, we understand, has been "imported" from New York. In our opinion it is for the interest of every legitimate business man to stamp out all put-up jobs and stock gambling operations—great or small.

If the large boards can in any way manage to crush out this evil, they will do society a great service, besides saving the name of stock broker from utter disgrace.

Notes on Contributions to Our Cabinet,*

New Mining District in Fresno County.

We have received a specimen of selected chloride ore from the Eureka mine, North Fork mining district, Fresno county, Cal. Judging from the appearance of the specimen it was taken from a surface outcrop. This ore is said to assay from $350 to $475 per ton, silver. Mr. J. S. Phillips, the metallurgist, pronounces very favorably upon the specimen. An old prospector who has examined it, says that it resembles very closely the rich ore from Cornucopia district, Elko county, Nevada.

Concerning the North Fork district, we give the following facts upon the authority of the Bodie *Standard:* "The North Fork mining district is situated about six miles northwest of Lake district, and on the western side of the summit of the Sierras, in Fresno county. It was discovered by Tom Agnew and M. M. Rice, and the district was formed June 17th, of this year. Mr. Rice was elected Recorder. The ledges crop out for a distance of three or four miles, and some of them are of great width, ranging from 12 to 100 feet and even greater. There is one ledge so extensive that the location of 600 feet in width does not cover the surface of quartz exposed. Up to this time about 40 locations have been made. Some of the best are the Advance, owned by Tom Agnew; the California Lion, owned by Rice & McCarty; the Lineretor, which is 40 feet wide, assays from which run from $40 to $147 per ton, all silver. In fact, there is no gold, apperently, in the district. The country has the advantage of being well watered and timbered. The main fork of the San Joaquin river runs within a mile of the main line of claim, and some locations are immediately on the bank of the river. The formation is porphyry and slate, the porphyry being of the same appearance and character as that of Lake district. West of the river the formation is granite." It is further stated that the country is not yet half prospected, in spite of the fact that there are excellent grazing meadows in the vicinity of the claims, rendering it a favorable locality for prospectors.

We catalogue the specimen as No. 565 of our collection.

*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and safely kept. A full account of the place, occurrence, etc., adds much to the value of such contributions. In another column we will gladly answer any reasonable questions regarding specimens so contributed.

PACIFIC COAST POSTAL CHANGES.—Postoffices established: Corwin, Eureka county, Nevada; J. Chamhelain appointed Postmaster. Cascade Locks, Wascoe county, Oregon; Ashley H. Ball. Milton, King county, Washington Territory; Walter D. Cotton. Fremont's Camp, Iron county, Utah; James Veator. Aztec, Pima county, Arizona; Christian Foster. Tombstone, Pima county, Arizona; Richard Gird. Discontinued: Dardanelles, Jackson county, Oregon; St. Joseph, Yamhill county, Oregon. Names changed: Ellis, San Joaquin county, California, to Tracey; Philip Fahian appointed Postmaster. Huleyville, Tehama county, California, to Gleasonville; G. Gleason. Postmasters appointed: John Todkill, Coleville, Mono county, California; John B. Fishhack, Bristol, Lincoln county, Nevade; John S. Craig, Mason Valley, Esmeralda county, Nevada; Henry O. Coe, Hood River, Wasco county, Oregon; N. Albert Wheeler, Alpowa, Columbia county, Washington Territory; Friend W. Wilson, Coveland, Island county, Washington Territory; Mrs. Ruth Reese, Greenville, Beaver county, Utah; Rev. S. H. Young, Fort Wrangel, Alaska.

THE BRUSH ELECTRIC LIGHT.—We call attention to the advertisement of William Kerr, President of the San Francisco Telegraph Supply Company, and agent for the Brush Electric Light. This light is in daily use in this city in the Palace Hotel and at the Union Iron Works. This invention is said to possess great advantages in simplicity, economy and effectiveness over other patents, and is the result of a study of the weak points in the work of other inventors. English scientists have made comparative tests, which resulted in the favor of the Brush machine and lamp.

THE attorneys of the New Idria Quicksilver Mining Company have renewed their application to the Department of the Interior for a patent.

THE Reese G. & S. M. Co., are suing the Rye Patch Con. M. Co., for possession of the Alpha mine, and for $225,000 damages.

THE Commercial Convention at New Orleans has adjourned sine die.

Hardening and Tempering.

We have been favored by A. Roman & Co., San Francisco, with a late publication entitled "Wrinkles and Recipes." It is a collection of practical suggestions, processes and directions for the mechanic, engineer, farmer and housekeeper. It is quite fully illustrated. The editor is Park Benjamin, Ph. D., and among the revisers and contributors are names that establish at once a reputation for the work. Of these may be mentioned Prof. R. H. Thurston, C. E.; Prof. P. H. Vander Weyde, M. D.; Richard H. Buel, M. E., and Joshua Rose, M. E. The frontispiece of the book is a color-tempering scale, consisting of a scale of colors beginning with dark blue and passing through pink, red, orange to pale yellow. On the sides of this scale are printed the names of tools, each opposite the color to which the steel is heated in tempering at 10 different establishments. At the dark blue end are saws for wood, and springs; near the middle of the scale at about orange we notice penknives, punches and dies, rock drills and chasers. At the pale yellow end are steel engraving tools and scrapers for brass. On this subject we extract the following from the book:

The user has only to look for the name of the tool which he desires to temper on the scale, and note the color opposite the mark. To this color, or to as near an approximation to it as possible, the metal being worked must be tempered. Where special steels are employed, it is possible that these marks may need some slight change, as they are here adapted to good quality ordinary American tool steel. A little experimenting will soon, however, exhibit the amount of variation for any particular kind of metal, and this amount is easily applied as a correction to the indications here given.

If we heat a piece of cast-steel to redness, and plunge it into clean water until its temperature is reduced to that of the water, the result will be that the steel will be hardened. The degree of the hardness will depend upon the quality of the steel, the temperature to which it was heated, and to a small degree upon the temperature of the water in which it was cooled. In any event the operation will be termed that of hardening. If we reheat the steel, a softening process will accompany the increasing temperature, until upon becoming again red-rot it will assume its normal softness, and if allowed to cool in the atmosphere the effects of the first hardening will remain entirely removed. If, however, after the steel is hardened, we polish one of its surfaces and slowly reheat it, that surface will assume various colors, beginning with a pale yellow, and ending in a blue with a green tinge, each color appearing when the steel has attained a definite degree of temperature; hence by the appearance of the colors we are informed of the temperature of the steel, or, in other words, how far, or to what extent, the resoftening has progressed. This chemical fact is taken advantage of by the machinist to obtain in steel any required degree of hardness less than that of the absolute hardness obtained by hardening, and is termed tempering. The temperatures at which these respective colors will appear are as follows:

Very pale yellow	420° Fahr.
Straw yellow	460° "
Brown yellow	500° "
Light purple	530° "
Dark purple	550° "
Clear blue	570° "
Pale blue	610° "
Blue tinged with green	630° "

To say, then, that a piece of steel has been tempered to a straw color implies that it was first hardened and then reheated until the straw yellow appeared upon it, the temperature having arrived at 460° Fahr., and that the reheating process was then discontinued. If, then, a number of pieces of steel of the same grade be heated to an equal temperature and plunged in water until cooled, and are subsequently tempered to the same shade of color, they will all possess an equal degree of hardness; but if other pieces of steel of a different quality or grade (this may be further specified by saying "containing a different percentage of carbon") be subjected to precisely the same processes, leaving upon them the same temper-color, while this latter batch will be uniform in hardness, it will not possess the same degree of hardness as the pieces of the first batch; hence temper-color may be used as proof of equality in the degree of temper in pieces of the same steel, but is not indicative of any determinate and uniform degree of hardness. In tool-hardening this fact assumes but little practical importance, because for tools a special quality of steel, termed tool steel, is supplied, which will harden sufficiently to give accuracy to the color-test tempering, when heated to any degree of heat answerable to from a blood-red to a yellow-red, the difference of hardness in steel quenched, from either of these degrees of heat, being too small to be of practical moment in all tools comparatively inexpensive to make. In tools that are expensive it is desirable to give the exact degree of temper which experiment has determined as the best. It will be noted that in the color-test the shades of yellow alone extend over a range of 70° of temperature, and tool-users know that within these 70° lies a wide range of hardness; and when we bear in mind how widely different persons will differ as to what is any specified shade or tint of color, it will be seen that in the yellow alone there is considerable room for error if the temperer he simply told the color to which a tool is to be hardened.

Mines and Works of Almaden.—No. 13.

[Translated for the PRESS from "ANNALES DES MINES."]

I. Description of the Works of Almaden.

The works for distillation designated by the name of *ceros de Buitranes* (enclosure of Vantours) occupies the western extremity of the hillock upon which is built the town of Almaden. The enclosure forms an irregular rectangle 320 meters in length by about 240 in breadth, so that the area enclosed is about seven and a half hectares. The whole of this vast enclosure is surrounded by walls of great hight in order to protect the establishment, against attempts of theft.

The arrangement of the interior of this enclosure, at the disposition of the different groups of furnaces, does not merit a special study; the works constructed there during more than two centuries have accumulated gradually, so that while it is true the furnaces are grouped in the neighborhood of each other, at the same time they are grouped without any systematic and regular order.

At Almaden two types of furnaces are employed, both of which have been known for a long time. The oldest of these is the Bustamente furnace, which was invented by Lope Saavedra Barba, at Huapeavelica, and was introduced at Almaden in 1633 by Bustamente; the other was copied at the beginning of this century from the furnaces with condensation chambers then in use at Idria, and they have retained the name Idria furnace, although they have been abandoned in the latter locality.

The Bustamente furnaces, or furnaces with aludels are always united in pairs; there are 20 of them in operation at the works, and form ten groups of two furnaces each.

The furnace, properly speaking, is a cylindrical shaft of a diameter of two meters, and a hight of six and a half; it is closed at the top by a hemispherical arch, pierced by an opening for the charging of the ore. A floor, formed of arches (called the *red*) which run parallel to each other, divides the shaft at the middle of its altitude into two compartments. The arches of course act as a sort of grating.

The lower compartment serves as a fire-room, a door upon the side serving for the introduction of fuel and the management of the fire; it is called the *atizadero*. A chimney placed near the *atizadero* serves to facilitate the combustion in accelerating the draft, and in avoiding the passage of the greater part of the smoke into the condensers. Brush-wood called *monto-bajo*, which is found in abundance on most of the mountains which surround Almaden, is burned in the furnaces.

The upper part of the furnace is that which receives the charge; it communicates by a series of flues, with two parallel series of jointed tubes of clay, called *aludels*, which fit the one in the other in such a manner as to form a continuous tube of variable section; the joints are luted as closely as possible. The aludels to the number of 40 to 45 are arranged upon two planes which incline downwards to the center; the first of these is called the *cabeza* or first half-plane, the other, the *rabera* or second half-plane. The aludels upon the first half-plane have at their belly or middle part an opening of from two to four millimeters in diameter, which permits the mercury condensed in the belly of the aludel to escape and to run down this inclined plane till it meets a gently inclined canal which runs along the line of intersection of the two half-planes. The aludels of the second half-plans do not have these openings; they discharge into two chambers for condensation, (a chamber for six rows of aludels); these chambers are surmounted by small chimneys arranged with dampers which may be opened more or less, so as to be able to regulate the draft at any point which is judged advisable.

The mercury flows from the canal down below this first half-plane to a receptacle of stone, called *pila*, or *pileta*. By underground tubes of iron it is conducted directly to the storehouse.

The furnace properly speaking, has a diameter of three meters, and a hight of seven and a half; in it, as in the furnace with aludels, the fire is separated from the ore by a perforated arch. The upper compartment communicates by five flues from each side with two systems of condensers with six chambers each; these chambers communicate, the one with the other, by openings placed alternately above and below. The last of each of these series of chambers is higher than the others in such a manner as to form a chimney.

The condensation chambers are lined with a bed of Portland cement, to prevent the loss of mercury through the joints of the masonry. Their base has the form of a reversed truncated pyramid, the bottom serves to collect the mercury, so as to allow its discharge by a small canal to the stone receptacle, and thence by subterranean tubes to the central reservoir.

The works of Almaden have only two of these Idria furnaces, which are united in a single structure.

The system of subterranean canals which allows the mercury from all the furnaces to descend by its own weight to the store-house, is certainly a very simple arrangement; it was, nevertheless, only established in 1871; by this arrangement loss during transport is avoided, and, above all, fraud is rendered much more difficult than it was formerly.

The store-house is an isolated building, closely guarded, containing 12 iron vats to receive all the mercury which comes from a group of two furnaces. The vats are accurately graduated in such a manner, as that a simple inspection of the level determines the weight of mercury contained in any one of them.

When we have mentioned, besides, a few shops for repairs, a small shop for the manufacture and baking of the aludels, and some buildings which serve for offices, we have finished the description of the extremely simple arrangements which are seen at the works of Almaden.

II. Treatment of the Ore.*

The reaction upon which is founded the metallurgy of quicksilver is itself of very great simplicity. In the presence of the air, at a temperature sufficiently elevated, the sulphide of mercury burns, giving rise to metallic mercury in the state of vapor, and to sulphurous acid. The roasting is effected in the furnace, while the condensation of the vapors takes place in the aludels of the Bustaments furnace, or in the condensation chambers of the Idria furnace.

Let us see in what manner this work is accomplished:

First.—With the Bustamente furnace. Each operation with the furnaces with aludels lasts three days.

The charging is accomplished by placing upon the *red* (or the grate of bricks) a bed of poor *solera*, of about 0.40 meters thick, or in the absence of the latter of stones from the quarry entirely sterile. Upon this first layer are thrown the largest fragments of the poor ore, then a certain quantity of poor *china* and of *requiebro*, upon this is heaped the *metal* (or rich ore) to the level of the flues. Upon the top of the *metal* is placed the fragments of the aludels, broken in previous operations, and the charging is completed with bricks or balls of *bacisco*. Sometimes with the material of these bricks is mixed the richer mercurial powders which come from the condensation chambers, or is taken from the aludels after preceding operations. In such cases, these balls or bricks are naturally richer than when they are made only of the broken ores and earth.

The charges are neither weighed nor measured; the workmen have such a familiarity with the furnaces as never to make even a small variation in the composition of the charge. It is composed somewhat as follows:

	Cubic Meters.	Weight in Kilograms.
Metal	1.0	1.840
China	3.0 to 3.5	5.290
Solera	1.5 to 3.0	2.070
Balls of Bacisco	200 balls	2.300
Total		11.5000

That is:

Metal	16%	of the charge.
China	46%	
Solera	18%	
Fragments	20%	

The charging is begun at the lateral charging door, which is bricked up as fast as the bed of ore is raised. The charging is finished by the upper opening, which is likewise closed when the furnace is full, with a paste formed of ashes and water; the same paste serves to lute the joints of the aludels and the charging doors wherever the mercurial vapors might escape.

When the furnace is thus prepared, the fire is lighted below and is continued during eight to ten hours; the consumption of fuel during this time is from 2.20 tons to 2.50 tons of wood.

After 10 hours of fire, the period of spontaneous roasting begins, called the *brasa* (embers) in opposition to the first, which is called the period of *llama* (flame). This lasts 45 to 46 hours. During this time the roasting of the ore continues and the temperature is maintained, owing to the combustion of the sulphur of the ore.

Then the period of cooling the furnace begins; the door for charging and that for firing are opened. The fire-room is cleaned and the ashes removed; the workmen then enter the place and discharge the residus of the roasting, and then begin immediately to charge. These last two operations do not take more than two hours.

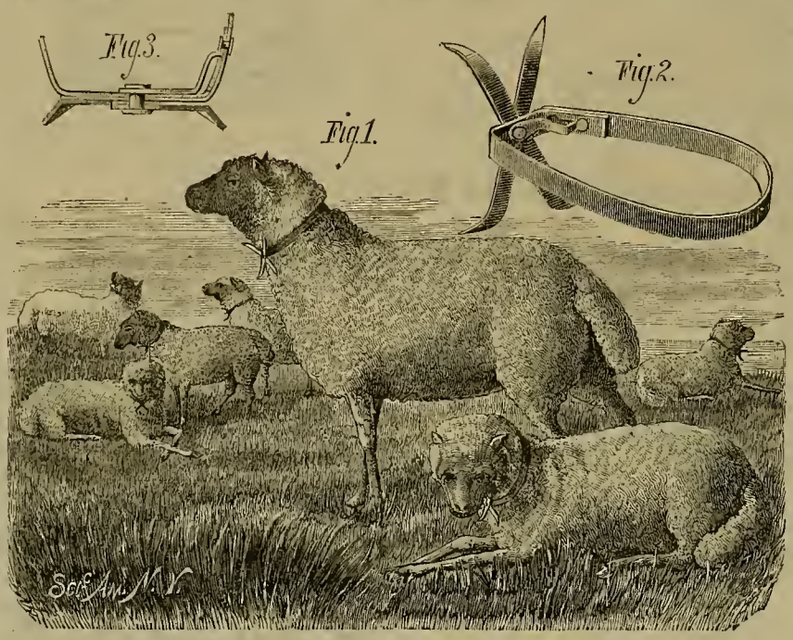
The whole operation of a roasting takes the name of *cochura* (production); each cochura lasts three days, divided as follows:

Charging	1.00 hours
1st period, firing	8.10 "
2d period, roasting	45.40 "
3d period, cooling	18.00 "
Total	72.50 hours

The residues of the roasting go improperly by the name of *scories* (slag). They are examined to separate any fragments of badly roasted ors; the rest is charged into mule carts and taken to the dumps outside the limits of the works.

Every 15 days, *i. e.*, after every five operations, the aludels are taken up from the first half-plane, in order to detach the thick layer of mercurial soot (*hollines*) which lines them, also to remove the mercury which is in the belly of each aludel. This operation is undertaken with the aludels of the second half-plane only every two months; the quantity of mercury which condenses there is, in fact, very small. The soot obtained in these cleanings is submitted to a sort of mechanical preparation upon an inclined plane; it is agitated with water, so that the small drops of mercury which it contains may be mechanically separated. The residues, formed with ashes often as strongly impregnated with mercury or with mercurial salts, are employed in the preparation of bricks for further treatment.

*They distill only in winter, and I visited Almaden in summer; this is not, therefore, a description from my own observation, but only from the explanations that the engineers and firemen have given me, with untiring kindness, and from the books of the establishment.



DEVICE FOR PROTECTING SHEEP FROM DOGS.

2. Work with the Idria Furnace.

The work with the Idria furnace resembles very much that with the Bustamente furnace; the amounts only are changed.

Each charge is about 28.75 kilograms, composed of:

	Cubic Meters.	Kilograms.		
Metal	2.50 or	4.600	16%	to the charge.
China	8.75 or	13.225	46%	
Solera	3.64 or	5.175	18%	
Bricks of fragments	480 or	5.750	20%	

The duration of an operation is six days: The first serves for cleaning and charging; the second, for the combustion of wood in the fireplace; the third and the fourth, for the roasting of the ore without exterior fire; the fifth, for cooling; and the sixth, for the removal of the "slag."

Three only of these days requires the presence of occupied workmen: one for the charging, which lasts 3 hours; one day for the firing, a third for the discharging. The three others require hardly any manipulation; it is only necessary to watch that no leakage of fumes occurs, and to open the doors the fifth day. At night the furnaces are abandoned entirely to themselves, and not even a watchman is allowed them; this latter is a mistake.

The consumption of wood is from 4.2 to 4.5 tons for each operation.

The soot deposited in the condensation chambers is washed in the chambers themselves; the residues serve as do those of the Bustamente furnace for the manufacture of bricks of fragments, and a part at least of the mercury that they contain is thus reutilized.

The mercury collected at the storehouse is enclosed in the well-known bottles of wrought-iron, of a hight of 0.30 meters, and a diameter of 0.13 meters, whose neck is arranged to receive a cork with a thread cut upon it so as to make a perfectly tight joint. These bottles, which go by the name of *frascos*, weigh (when empty) from 5.5 to 6.5 kilograms, and contain 34.507 kilograms of mercury (three *arrobes*, or 75 Castillian pounds). The empty *frasco* costs from 6.50 to 7 francs.

Let us now render an account of the results obtained by these two methods of treatment.

In the winter season of 1875-6, from October 12th, 1875, to April 27th, 1876, the 10 groups of twin Bustamente furnaces worked without interruption, at the rate of one roasting every three days; they made, therefore, a total number of 1,320.

The average charge was 11,220 kilograms. The average of mercury produced, 824.716 kilograms per operation. The average yield of the ore, 7.35%.

The fuel is furnished by contract; that is to say, a workman undertakes the firing at a fixed sum per charge.

The price was, in 1875, about 23 francs per operation, for a consumption of 2.2 tons to 2.5 tons. The aludels are manufactured at the works by a contractor, who sells them at the rate of 0.30 francs; their consumption represents but a small figure.

[To be Continued.]

A Sheep Protector.

We illustrate on this page a device which a South Carolina shepherd, Capt. C. Gilbert, of Bucksville, South Carolina, has contrived for protecting sheep from seizure and injury by dogs. The value of the protector depends, of course, upon the disposition of the dog to seize his victim by the neck. We have seen sheep seized otherwise, but probably there is a considerable percentage in favor of neck seizure, and to this extent the protector may be invaluable. The inventor, Capt. Gilbert, testifies that his sheep were safe amid a pack of evil curs, and thus gives his own testimony in favor of his invention: Fig. 1 shows the protector in proper position around the sheep's neck. Fig. 2 shows the button-head properly drawn into the small part of the slot, and the protector firmly locked by the latch-button, which holds it permanently fast around the sheep's neck. Fig. 3, with Fig. 2, shows the relation of the button and lock-latch to the other parts.

The invention consists in a metallic collar or neck-band, which is fastened together by means of a slot and rivet or button, and is provided with cross pieces, having pointed ends. This is the sheep protector proper. The band or cross pieces may be stamped with the owner's name and the year it was placed upon the sheep, so as to keep a perfect record of every member of the flock. It may also be painted in colors by which one may at a glance distinguish his own from every other person's sheep at a distance, without the difficulty often experienced of ascertaining the ear marks. This band also comes into use when the animal is to be caught for shearing. By means of a hook somewhat resembling the ancient shepherd's crook, the sheep is taken by the collar and gently controlled by the shearer.

The serious losses which flock-masters suffer by the inroads of worthless dogs are well known. Laws and dog taxes have availed something, but the evil is still of alarming extent. The most careful statistics that could be gathered by the Agricultural Department at Washington, show the present estimate of sheep in the United States to be 35,740,500 head, valued at $80,603,062. This is a problem worthy the attention of inventors, as the lawmakers have failed thus far to solve it. For this reason we are disposed to show the device which the South Carolina flock-master has brought forward, so that those interested may examine and test its efficacy. Those who wish to know more of the protector can obtain particulars by addressing Thomas W. Beaty, Conwayboro, South Carolina.

PURCHASING AGENT.—Perhaps some of our readers who need articles from the city, and cannot come to buy them, may be aided by attention to the advertisement of Wheeler Martin in this issue of the PRESS. Mr. Martin is recommended by a long list of our leading merchants, and we doubt not will give satisfaction to interior residents who trust him to fill their wants.

IT is said that the Union and Central Pacific railroads are moving for consolidation. They may then establish complete monopoly by purchasing or leasing the Pacific Mail.

ON the 9th inst. the Secretary of the Treasury issued the 74th call for redemption of 5-20 bonds of 1865, consols of 1865. Interest ceases March 9th next.

INDIANS are said to have done as well as white men in Government freighting between the Missouri river and the Rosebud Agency.

EXCURSION parties of merchants, capitalists and manufacturers, will go to Mexico from New York and Chicago; object, to promote trade.

FROM Yuma, Dec. 6th, 14,000 pounds of Silver King concentrations were forwarded to San Francisco.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E.COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

South Pacific Coast Railroad.
New Route (Narrow-Gauge.)

Commencing Monday, September 30th, 1878, boats and trains will leave San Francisco daily from the New Ferry Landing, foot of Market street, at 5:30 A. M., 9:00 A. M., and 4:00 P. M. for ALAMEDA, SAN JOSE, LOS GATOS, ALMA, and all way stations.

Stages connect with 9:00 A. M. train at Alma for Santa Cruz.

EXCURSION TICKETS will be sold Saturday afternoons and Sunday mornings from San Francisco and Alameda to San Jose, Los Gatos, and Congress Springs, and return, at reduced rates, good only until Monday evening following date of purchase.

FERRIES AND LOCAL TRAINS, DAILY.

From San Francisco.—5:30, †6:40, 9:00, 10:30 A. M.; 1:30, 4:00, 5:15, 6:30 P. M.
From High Street, Alameda.—†5:40, 7:40, 9:04 A. M.; 12 M.; 2:40, 4:00, 5:16, 6:24 P. M.
†Daily, Sunday excepted.

The Company are prepared to carry vehicles of all kinds on the Ferry, to and from San Francisco, Alameda and Oakland.

THOS. CARTER, Superintendent. GEO. H. WAGGONER, Gen'l Passenger Agent

California Artesian Well
— AND —
MINING COMPANY,
202 Sansome Street, San Francisco.

Having located, under the title, and at the place above indicated, for the purpose of conducting the ARTESIAN WELL, LAND IRRIGATING, PROSPECTING and MINING business, in all its various branches, on the Pacific Coast, we call your attention to the following facts:

1. That we have the best Machinery in the world, and so pronounced by the best judges in the world.
2. That we are practical Miners and Engineers, and understand what we are about.
3. That we sink Wells to any required depth, through all formations, including quicksand, boulders, and the hardest rock.
4. That we perform the above named service for about one-half the prices now charged for the same.
5. That as we do not expect to bore the whole Pacific Coast ourselves, we will sell our Machinery to parties who desire to purchase, and instruct them how to use it, free of charge.
6. That we want active and responsible Agents, and will guarantee a fortune to men of the right stamp.
7. That by calling at our office, or addressing us for circulars and catalogue, we will verify the above statements to the satisfaction of all reasonable and sane inquirers.
8. That if you or any of your friends are interested in the above facts and statements, we shall esteem it a favor if you or they will call upon or address us, and we will talk business and tell you the truth every time.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

CAUTION
To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,
North Bloomfield, Nevada Co., Cal., October 1st, 1878.

ARITHMETIC MADE EASY
BY ROPP'S
Easy Calculator.

This valuable work is used by thousands of farmers, mechanics and business men, and is highly recommended for its practical utility and convenience.

It embodies an entirely new system of calculation, by which a vast amount of figures and mental labor—required by the ordinary methods—and fractions with their complexities, are absolutely avoided.

It is so simple and easily comprehended that even the most illiterate is enabled, in a few minutes, to reckon with absolute accuracy and speed; while its original and rapid methods, benefit and delight the most scholarly.

It shows at a glance the accurate value of wheat, corn, rye, oats, barley, cattle, hogs, hay, coal, lumber and merchandise, from one pound to a car load, and for any price the market is likely to reach.

It gives the interest, simple and compound, on any sum, or any time, at six, seven, eight, and ten per cent.; the exact measurement of boards, scantlings, timbers, saw logs, cisterns, tanks, wells, granaries, bins, wagon beds, corn cribs, etc., the wages at various rates, for hours, days, weeks and months; besides numerous other important methods, rules and tables.

It is printed on fine tinted paper, is well and elegantly found in pocket-book shape, and accompanied by a silicate slate, pocket for papers, and memorandum, which can be replenished in the two latter styles.

It answers the purpose of a pocket book and diary, and costs no more, although it was gotten up at great expense and labor, and is unquestionably one of the most useful publications ever issued from the press.

Price, bound in Fine English Cloth, $1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted by express. Address

DEWEY & CO., San Francisco.

American Machine
AND
Model Works.

Experimental and Fine Special Machinery, Planing and Gear Cutting, Printing Press, Band Instrument and General Machine Repairing; Dies, Taps, Punches, Reamers and other Tools made to order. Models and Patterns for Inventors promptly executed in Wood or Metals. 514 Commercial Street, between Sansome and Leidesdorff, Third Floor), San Francisco, Cal.

I. A. HEALD, Proprietor.

San Francisco Pioneer Screen Works,
J. W. QUICK, MANUFACTURER,

SCREENS

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

SWEET Chewing JACKSON'S BEST NAVY Tobacco

Awarded *highest prize* at Centennial Exposition for *fine chewing qualities* and *excellence and lasting character of sweetening and flavoring*. The best tobacco ever made. As our blue strip trade-mark is closely imitated on inferior goods, see that *Jackson's Best* is on every plug. Sold by all dealers. Send for sample, free, to C. A. JACKSON & CO., Mfrs., Petersburg, Va.

L. & E. WERTHEIMER, Ag'ts, San Francisco

Machinery.

The Ingersoll Rock Drill.

The lightest, most easily adjusted, and only Drill using rubber buffers to protect cylinder-heads, and with Automatic Feed.

Some of the mines using this Drill on the Comstock Lode, Virginia City, Nevada:

Best & Belcher M. Co.,	Con. Virginia M. Co.,
Crown Point M. Co.,	California M. Co.,

REYNOLDS, RIX & CO., Agents.

18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

The Only SAFE BOILER.

SAVES One-half the FUEL Consumed by Others.

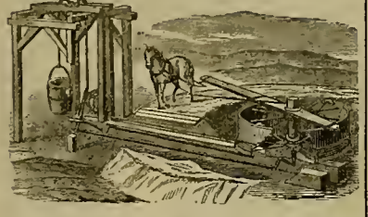
The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,

18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,

18 & 20 Fremont Street San Francisco, Cal

P. O Address: ALAMEDA, CAL.

Continued from page 373.

the drift now being run on the 2000 level from the Ophir. On the 1950 level north drifts No. 1 and No. 2 have been connected. No. 1 is now being driven vigorously forward, the face still in a favorable vein formation. The daily yield of ore is 330 tons, keeping the California mill steadily at work crushing.

OPHIR.—The extraction of ore from the 1900 and 2000 levels is going steadily forward. There are now 600 tons of ore in the dump ready for shipment. It is the intention, in a very few days, to start up the Brunswick mill on this ore, there being now ample ore in sight to keep the mill running for some time to come.

SIERRA NEVADA.—Sinking the south incline winze is being pushed vigorously forward, the bottom still in the same lively, healthy looking cap formation, carrying all the favorable features heretofore reported, even to an occasional rich assay of ore from the bottom and sides. At the 2200 level no work has been done of any consequence in either the north or south crosscuts. The north crosscut penetrated 14 feet of rich ore and then, striking low grade ore, was stopped. The north drift from this station, to connect with the north winze from the 1700 level, is being pushed steadily forward, running outside of and parallel with the ore vein.

CON. VIRGINIA.—The south drift, on the 1950 level, is steadily advancing, the face still in a fine vein formation. The main east drift, on the 1400 level, has reached the ore body, and an upraise is now being made preparatory to extracting ore.

YELLOW JACKET.—On the 2400 level of the old mine the main drift south is in vein porphyry with streaks of quartz and clay.

BELCHER.—Sinking the main incline is making good progress. The south drift on the 2360 level continues to show a slight increase of water and a gradual improvement in the character of the quartz. The east crosscut, No. 2, on the 2360 level, shows a slight improvement. The west crosscut, on the 800 level, is making steady progress without change of valne.

NORTH BONANZA AND FLOWERY.—The east drift in the North Bonanza croppings has reached, after passing through 50 feet of ore interspersed with ribs of hard, flinty quartz, what appears to be the east clay wall. The last seven feet before reaching this clay wall was rich ore of a free milling character.

NORTH CON. VIRGINIA.—The new side track of the Virginia & Truckee railroad is completed and the cars are running to the shaft. The water pipe is also laid so as to connect with the water works on Cedar hill. The boilers are inclosed, the smoke-stack up, all ready to turn on the steam. Sinking the shaft has been somewhat delayed by the putting in of a pump station and tank at the 1500 level.

BULLION.—The main incline is now down 149 feet below the 2050 level station. The combination drift on the 2400 level is now in hard blasting porphyry. The west crosscut on the 2,000 level is making steady progress, the face in hard blasting rock. The east drift on the 2050 level is making good progress, the face in fine vein matter. A drift north has been started on this level at a point 75 feet east of the main incline.

GOULD & CURRY.—Sinking the joint shaft has not made the usual rate of progress on account of an increase of water in the bottom, which has given considerable trouble. This is probably only a pocket, and will, no doubt, soon be drained.

SOLID SILVER.—The crosscut west from the winze below the tunnel level will not have to run more than 10 feet to reach the great west ore vein.

CROWN POINT.—Sinking the main double incline winze below the 2300 level is making steady progress. The east crosscut on the 2300 level, from the winze, is in 400 feet, the face in quartz of low grade, mixed with porphyry. The north crosscut is in 50 feet, the face in soft porphyry.

CALEDONIA.—The flow of water from the east drift on the 1600 level is still quite strong. This drift is advancing at the rate of four feet per day, the face in vein porphyry, streaked with quartz. The north drift on the 1600 level is making good headway, the face still in hard blasting rock.

HALE & NORCROSS.—The water stands in the main incline 49 feet below the 2300 station, the joint cast drift on the 2000 level not making as fast speed as heretofore, having struck a belt of very hard rock. The machinery is all in good working order and everything is working nicely.

SUCCOR.—Sinking the main shaft is making the best of progress. The prospecting drifts on the ore vein, on the 1050 level, are looking well and are being rapidly advanced.

SUTRO TUNNEL.—The south lateral branch towards the Julia shaft is making improved progress.

TROJAN.—The ore stopes on the second station level continue to yield good ore. The mill was started up on the first of the month with a supply of 1,150 tons of ore on hand.

OVERMAN.—There are no changes of value to report of any portion of the mine. Good progress everywhere.

SAVAGE.—The joint east drift on the 2000 level is making good progress, the face being in much harder rock than for some time past. The east crosscut on the 2100 level is making steady progress, and the face is still in very soft favorable vein matter. The water stands at a point about 40 feet below the 2000 level.

JUSTICE.—The extraction of ore is more than sufficient to keep the Pappoose mill steadily running. The ore is of a fair grade and will pay well for milling. There are no particular changes to note in any of the ore-producing sections of the mine.

UNION CON.—Sinking the joint Mexican winze is going vigorously forward, the bottom in good blasting porphyry. The flow of water from the east drift gives no trouble in handling. The repairs to the main north drift on the 1600 level are making rapid progress.

Machine-Shop Rambles.

The machine shops share the general depression in business, but still there is a great deal to be learned from visits among them. We have lately looked through the establishment of

William Deacon,

On Main street, in this city. He has just completed the machinery for the new tug, *Hercules*. This machinery is after the model of that in the *Governor Irwin*, manufactured by the same maker, but is twice as large. The engine will weigh about 13 tons, and the entire machinery about 22 tons. The engine has two 24-inch cylinders; 18-inch stroke. The screw is 9½ feet in diameter; pitch, 13½. The tug will probably make a trial trip in a few days. The machinery of

A New Steam Launch,

Built for the Alaska Fur Company's steamer, *St. Paul*, is at the shop. The engine is, of course, miniature, weighing only about 500 pounds. The boiler work will weigh about 1,900 pounds, and has been tested to a pressure of 260 pounds to a square inch. The screw is 26 inches in diameter. The launch is 27 feet from stem to stern, and 6 feet beam. It will be hung on the same davits as the ordinary ship's boats. Both boiler and engine are so fixed that they may be taken in and out of the hulk in a very few moments by the use of light tackle. The boiler, for instance, rests on a cast-iron saddle which is fixed in the bottom of the launch. To this saddle it is clamped by keys that may be readily removed. On top of the boiler is a hole for the insertion of an eye-holt. The keys below, removed, and the eye-bolt once in its place, the removal of the whole boiler is a very simple affair. It is the same with the engine, which is similarly keyed down. In order to facilitate such removal of the engine, the latter is connected to the shaft by means of a compensating-joint, so that no coupling-bolts have to be unscrewed before attaching the tackle to the eye-bolt above the cylinder, and lifting the engine out. In Deacon's shop is the

Longest Single Lathe

In the city. The length from center to center is about 26½ feet. Upon this, at the time of our visit, they were turning the thread on 2¼-inch shafting to be used in making presses for whaling vessels. These presses are worked by hand, and are carried with the whaler for pressing out the scrap. Mr. Deacon has made a great many of them; but whaling vessels have an inconvenient way of getting wrecked so often, that there is a considerable number of new presses demanded every season. The screws are made about 5 feet long. The shafting is turned in pieces about 10 feet in length, each piece supplying two presses.

Other Notes.

Engine No. 1, of the San Francisco Fire Department, was standing near the doorway of the shop, waiting for repairs. A coupling was being put on a 3-inch shafting, for the upright shaft of a flour mill. Occasional repairing is done in the shop upon many steamers that frequent the harbor, among them a number of Government vessels, as the *Shubrick* and *MacPherson*.

News in Brief.

EARTHQUAKE in northern counties Dec. 9th.

BLAINE has been shaking hands with Blackburn.

THE fall of the Italian ministers is said to be inevitable.

THE Mexican excursion party leave Chicago, Jan. 4th.

INDIAN depredations continue to be reported from Nebraska.

IT is reported that the Ameer has fled because of a revolution in Cabul.

THE Turkish Ministry have been dismissed and new ministers appointed.

GENERAL ROBERTS has gained a complete victory over the Afghan forces.

THE Throckmorton land case has been decided in favor of Throckmorton.

HON. ALEX. H. STEPHENS met with a painful accident at Washington, Dec. 4th.

MONCASI, who attempted to kill the King of Spain, has been granted a new trial.

An ex-member of the Ohio Legislature, has been convicted at Cincinnati of perjury.

FLOURDUST explosion has caused the distruction of another Minneapolis flour mill.

A GRAIN GRADER, the first ever built in this State, is being constructed at San Francisco.

IT is proposed by the Austrians to appropriate 20,000,000 florins as occupation expenses in 1879.

HENRY TAYLOR & SONS, grain and flour merchants, Glasgow, have failed. Liabilities, $650,000.

PREPARATIONS for the Sydney International exhibition of 1879 are progressing very satisfactorily.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

FOR THE WEEK ENDING NOVEMBER 26TH, 1878.

MACARONI MACHINES—Giocomo Grondona, S. F.

FRUIT AND PACKING BOXES—Matthew Cooke and Robert J. Cooke, Sacramento, Cal.

BOX FASTENERS—Matthew Cooke and Robert J. Cooke, Sacramento, Cal.

HOSE CARRIAGES—John Wibz, Santa Cruz, Cal.

MEN AND BOYS' CLOTHING—Trademark—Banner Brothers, New York, New York and San Francisco, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BLIND SLAT ADJUSTER.—Wm. Cruse & John D. Isaacs, West Oakland.—Dated November 19th, 1878.—The invention relates to an improved mechanism for operating the slats of blinds, by which the ordinary rod connecting the slats may be dispensed with. The improvements consist in providing at the ends of the slats a ferule carrying a pin or lug, which lug engages with an oblique slot in a strip which slides in a rabbit on the back of the head carrying the slats. This rabbit is formed on the side of the head opposite to that on which the slats are, so that it is entirely out of sight. A thin projecting handle is fastened to the strip which has the slots in which the pins travel, so that by sliding said handle up or down the strip turns the slats in any desired position simultaneously. By thus giving a rectilinear motion to the strip, a rotary one is imparted to the slats. The operating mechanism is easily accessible, and is not likely to get out of order; nor are any slots necessary in the wood work to set in escutchion plates as is usual.

MACARONI MACHINE.—Giacomo Grondona, S. F. Dated, November 19th.—This invention relates to an improved machine for making macaroni and other articles, from flour paste. It consists of an upright double cylinder, bolted to the outer side of a vertical frame, which also carries a piston operated by screw and lever. The cylinder is made double, so that steam or hot water may be admitted to the space between the two, in order to keep the paste in the inner cylinder in proper condition. The piston is operated by a screw and hand lever, with ratchet and pawl connections, means being provided so that the piston may be moved in either direction by means of a hand-wheel, independent of the pawl and ratchet. The bottom of the inner cylinder is provided with a strong hinged door or movable plate, which receives the perforated dies of any style to form the desired article. This device is mainly intended for use in families, where small quantities of macaroni, or other articles from flour paste may be made without the use of steam power.

The "Press" in Arizona.

Henry R. Ewald left San Francisco on Tuesday of this week for Arizona. He will visit various parts of that promising Territory in the interest of our paper, receiving subscriptions, taking notes for publication, etc. He is well and favorably known in Oakland, California, as well as in the Territory, where he has resided for years. It is our intention, as far as we can gain facts, to give prominence to the real and permanent interests of our neighboring Territory. With her our State is becoming more and more intimately connected every day, and that literally; for it is said that, as early as the day after the publication of this notice, regular trains will be running from Yuma to Gila City. This is only the first short step in a progress which is to reveal to the outside world more clearly than ever before the vast resources—mineral, agricultural and grazing—of Arizona. Any assistance given to a gentleman, who, like Mr. Ewald, will have it in his power to publish to the world what he sees and hears, will be an act of friendship to the Territory, whose advancement we all wish to encourage.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Cohle, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

General Robert Allen Silver Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Globe Mining District, Pinal County, Arizona.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 20th day of October, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John J Cushing	8	3000	$750 00
Robert Allen	12	1000	250 00
Robert Allen	13	440	110 00

And in accordance with law, and an order of the Board of Directors, made on the seventeenth day of October, 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Tuesday, the seventeenth day of December, 1878, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. W. CLARK, Secretary.

Office, 318 Pine street, Room 6, San Francisco, Cal.

Summit Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of November, A. D., 1878, an assessment, (No. 6,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the sixth (6th) day of January, A. D., 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the fourth day of February, A. D., 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

The California Fruit Growing Association.

—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three ($3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the California Fruit Growing Association, held September 23d, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till Saturday, the 26th day of October, 1878, and the day of sale of delinquent stock is hereby postponed to Friday, the 22d day of November, 1878. D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco.

POSTPONEMENT.—At a meeting of the Board of Directors held on the Nineteenth day of October, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till November 30th, 1878, and the day of sale of delinquent stock is hereby postponed to December 21st, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento Street, San Francisco, Cal.

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the salo. JAS. W. BAKER, Sec'y.

Office, No. 109 California street, Room 1, San Francisco, California.

POSTPONEMENT.—By an order of the Board of Directors made on the First day of October, 1878, the above sale is postponed until Monday, October 21st, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

POSTPONEMENT.—By an order of the Board of Directors made on the Eighteenth day of October, 1878, the above sale is postponed until Friday, November 1st, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

POSTPONEMENT.—By an order of the Board of Directors made on the first day of November, 1878, the above sale is postponed until Monday, November 18th, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

POSTPONEMENT.—By an order of the Board of Directors made on the eighteenth day of November, 1878, the above sale is postponed until Monday, December 2d, 1878, at the same hour and place. JAS. W. BAKER, Sec'y.

Fine Engraving.

The Engraving Bureau belonging to the office of this journal is prepared to design and engrave all kinds of WOOD CUTS for illustrating newspapers, books, catalogues, cards, circulars, advertisements, labels, badges, seals, etc., in the best style of the art. Our portraits and illustrations of machinery, buildings and landscapes, are superior. Good engravings can be made from paintings, lithographs, steel and copper plate prints, photographs, models, patent office or other drawings. We have a photographic department and the best of machinery for producing accurate and perfect work at the lowest prices. Original maps, charts and diagrams are made by our NEW PHOTO-RELIEF PROCESS at greatly reduced rates. By the same process copies can be cheaply and quickly produced of printed cuts, in *fac simile*, or they can be enlarged or reduced with equal facility.

Any hand writing in perfectly black ink on clear white paper for manuscript letters or circulars, will be accurately reproduced in metal plates suitable for common printing. Also, *fac simile* signatures, monograms, sheet music, etc. We excel in trade outs and matched plates for combination color printing. With a large business, long established, and every facility for improvement, we can guarantee more than ordinary satisfaction to all of our patrons. All interested are invited to send for or call and see specimens and obtain prices.

Orders for electrotypes, stereotypes, steel and copper plates, lithographing, stamps and seal presses executed at low rates.

At the Old Stand, Market, head of Front Street, S. F.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc, etc

TUBBS & CO.,

611 and 613 Front Street, San Francisco

DRIVING NAILS UNDER WATER.—Stack's illustrated advertisement appears once a month in this paper.

Elephant Ore Stamp.

We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The 'Elephant' having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thoroughbrace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the Machine weighs more than 1,800 pounds, the handling of the Machine is comparatively easy, and in places where it would be necessary to pack the Machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order. The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 242 Main street, near Harrison, San Francisco. For particulars apply to

CHESTER STEEL CASTINGS CO.,

EVELINA STREET, - - PHILADELPHIA, PA.

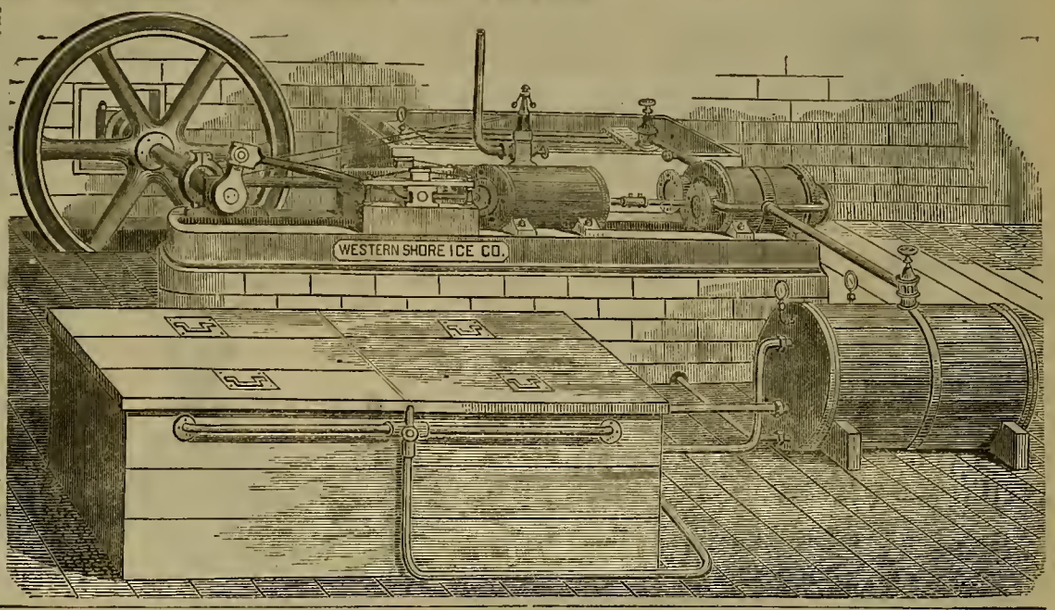
THE WESTERN SHORE ICE COMPANY.

Office, No. 330 Pine Street, San Francisco, Cal.

This Company having acquired from H J WEST, of London, the sole and exclusive right to manufacture and sell on the Pacific Coast his world renowned ICE-MAKING AND REFRIGERATING MACHINES, are prepared to supply the same to Hotels, Restaurants, Clubs, Breweries, County Towns and all manufacturers and consumers of Ice on this Coast.

A one-ton Machine will manufacture clear Ice in blocks of any desired thickness, from three inches to four feet and upwards, at a cost of *one quarter of a cent per pound*. A twenty-ton Machine will manufacture the same description of Ice at a cost of *one-fourteenth of a cent per pound*. In cases where power is a really on the pounds s the cost of manufacture will be less than one-half of the above figures. These Machines have obtained the First Class Prize Medal at the Great Exhibition in London of 1862; the Prize Medal at the Vienna Exhibition of 1873; and are now supplying Ice at the Paris Exposition. Many valuable improvements have been recently made, and they are now acknowledged to be the most complete and economical Ice-Making Machine in the world. Apparatus has also been constructed under these patents, which is now in successful operation in Great Britain, India, and New York, equivalent to the manufacture of a *million pounds of Ice daily*.

The accompanying drawing illustrates one of the patent transparent block ice making machines manufactured by the WESTERN SHORE ICE COMPANY. To this apparatus a very plain and simple Steam Engine is attached for working the Air-pump. This is made direct acting, by which means the use of all belts or gear-wheels is avoided. Where, however, a separate motor exists, the Machine may be had without the Steam Engine, in which case there is of course a consequent proportionate reduction in the cost.



PATENT REFRIGERATING APPARATUS.

BREWERIES.—The eminent success which has attended the introduction of this patent apparatus is ample proof of its great superiority over every other known invention of the kind. The most eminent brewers in the world, including Allsop & Sons, Truman, Hanbury, Buxton & Co., and Guinness & Co., have adopted this system, and have eleven of these Machines of the largest kind in use, while 38 of them are employed in various other Breweries in Great Britain.

Among the various other purposes for which this new patent machinery is valuable, are the cooling of air or liquids, preserving meat, fish, vegetables, fruits, etc., cooling Hospital Wards, Theaters, Dairies and for all purposes where a low temperature is desired.

The WESTERN SHORE ICE COMPANY are prepared to supply Refrigerating Machines of a capacity for cooling from 50,000 to 500,000 cubic feet of air per hour to 30° Fahr.

For Circulars and particulars as to prices and any other information desired, apply to the Secretary of the

Western Shore Ice Company,
330 Pine St., Rooms 61 & 62, San Francisco.

All Machines Sold will be Accompanied by a Guarantee.

EDISON'S ELECTRIC PEN and PRESS.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, DECEMBER 21, 1878.

VOLUME XXXVII Number 25.

Picturesque Arizona.

Mr. E. Conklin has presented us with a copy of his "Picturesque Arizona," lately published by the Continent Stereoscopic Company, of New York, and for sale by A. L. Bancroft & Co., and Billings, Harbourns & Co., San Francisco. The book has faults and merits, but is written in an easy, chatty style and is in parts very readable. Our readers can best judge of it from an extract. The following is taken from the chapter beginning with the topic, "Mining Capital in Arizona:"

Up to January 1st, 1874, American mining capital in Arizona had never even paid expenses. Bearing this in mind, the traveler is struck by the marvel in the last four years. During this time there have been many mines opened, and some of them paying large dividends. Bearing in mind these facts, it was a matter of some surprise to me when coming down the Colorado on one of the Colorado River Navigation Company's boats, to find 14 bars of silver bullion, representing in the aggregate a value of about $20,000. This was from the McCracken mine in Mohave county. My surprise gave way to satisfaction when I learned from Mr. Burke, the purser, that this was getting to be "quite a common occurrence along the river now," and I then concluded, as I had before surmised, that there was yet a land where the old spirit of '49 might find a new vent. The ambitious have now a chance to revive the old spirit of early California without doubt. They have an opportunity of vindicating their pluck now, and their fortunes too, in this land of the Apaches.

After having crossed the Colorado river at Ehrenberg, and going east, information comes to you thick and fast of the future prospects of this section, and of the very flattering one of the region round about Prescott. You hear of the McCracken mine which now, and in a space of only two years, has a 50-stamp mill on the grounds, extensive tunnels, with shafts down 50 to 75 feet, and producing $100,000 per month. Leaving the McCracken mine and the Hope district to the northwest, you are approaching the Hassayampa district near Prescott, where it is said genuine black metal is reached at a depth of seven feet. This region of rich silver deposit near Prescott is the second in the vast mineral belt extending from the extreme southeast corner to the northwest corner of the Territory. Some distance before reaching Prescott you pass the abandoned works of the famous Vulture mines, in which abandonment is again re-echoed the too often repeated story of the attacks and murders by the Indians. This is the story with all like cases of abandonment of mines in the Territory, and they abound on every hand. The country is full of them, and invariably the Indians are the cause.

The mines themselves never give out, it is said—a peculiar feature of the mines in Arizona and the Southwest. This remark would seem to be substantiated in an opinion once given by Prof. Ehrenberg, that there was a continuous range of gold-bearing rock from the Vulture mine to a point 10 miles north of Prescott, embracing an area of at least 1,000 square miles.

We are now in the region, too, which promises to turn out its vast quantities of cinnabar; and also in a region where the old pastimes of picking up nuggets threatens to draw those less willing to work or dig. To the southeast again, along this same continued belt of rich mineral, over the Mazahyal range, you enter the Globe and Pioneer districts. In this district is the famous Stonewall Jackson discovered by McMillen. The history of this mine is well known, and is being perpetuated in the minds and memories of men as one of the leading events in the history of mines in the Territory. The mine was discovered in 1874, and shortly after the discoverer sold it for $120,000. No sooner had he sold it than word reached his ears that the parties who purchased it would have given him $250,000 had it been necessary to obtain it; and also that others behind them again stood ready to give $300,000 rather than not obtain it. A shaft in these mines, down only 90 feet, gave ore running as high as $24,000 to the ton in 1876. It is said that since the purchase, the mine has been estimated to be worth $8,000,000.

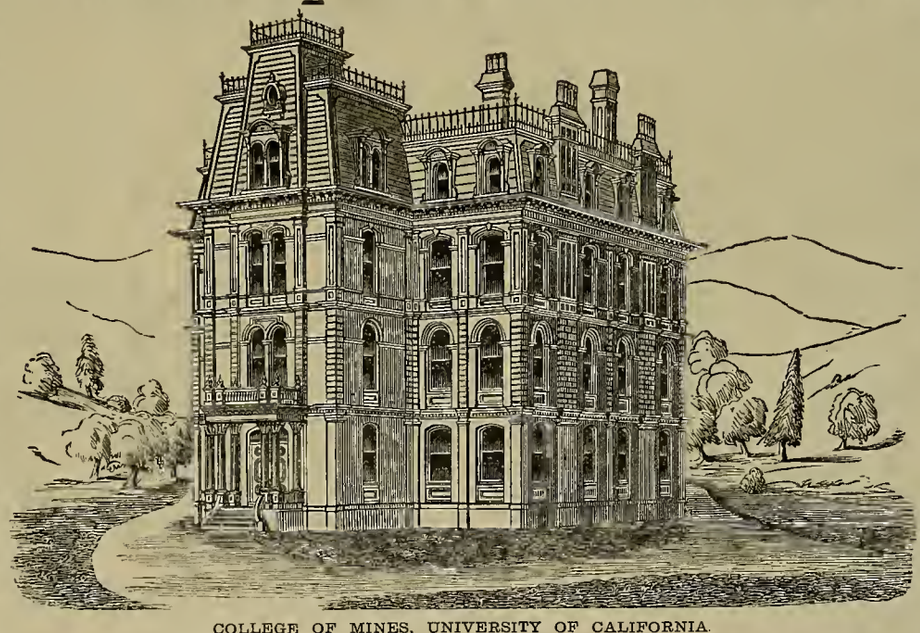
Southeast again, into the Santa Ritas and the Oro Blanco districts, we strike the "last but not least" of the mines of this great natural metalliferous belt which lies within the boundary of Arizona. We say "last but not least" and support our claim with substantial evidence; for in a continuous course of these mountains over the boundary line, and into Sonora, you have what is, and has long been known as, the greatest silver-bearing country on the North American continent. In this section, a little to the east of Santa Cruz valley, is the famous placer mines, long known to exist, in and around the Baboguivari mountains. These stories are brought to us with the name of Col. J. D. Graham. The progress Arizona has made within the past few years may be realized to some extent by the fact that in 1877 she yielded up over $4,000,000 in gold and silver. It has been said on good authority that "no one of the mineral-bearing Territories of the Pacific slope is richer than Arizona, though the mines have not been generally worked."

Like stories confront the traveler on every hand in Arizona; and the most of them are substantiated upon better acquaintance. Not only in relation to gold and silver are they confined, but minerals of most all known usefulness are being discovered. Many such cases lie dormant for means of transportation. With the introduction of the steam car and rail a great blockade will be raised and Arizona will flood the world with its riches. Our Emma mines will never rise to the surface again, and our Crown Points and Consolidated Virginias will sink much below. Even now it is a noted fact that mines which would receive much attention further north, are allowed to lie undisturbed here. Copper enough exists in the mountain in the eastern part of the Territory to cause one man alone to say, if he had railroad facilities, he would employ 1,000 men in his mine. This is in the southeastern part of Yavapai county. In another section evidences of tin are reported. The species found consists of both nugget and stream tin.

We have had occasion, by dint of narrative, to simply refer to the Stonewall Jackson mine and the richness of the McMillen mining district. These narratives of golden fleece and shining nuggets being so rife in Arizona, entertaining the traveler on any and every trip or route he may propose or select, one can scarcely avoid asking the question why, if all these stories are true concerning the mines of Arizona, and their richness, they have not already been worked. I have been asked these questions myself over and over again; and after narrating what I saw, and having converted by actual knowledge, those fairy-like stories into absolute existences concerning the fabulous wealth of her mines, I would here offer a defence for Arizona for the seeming lack in her mining developments.

Arizona has had more than her share to contend with. She was the last acquired, and, of all our Territorial lands, situated to the further end of our national domain; until at present she was off the beaten track of our country's physical progress, and consequently the hardest to guard and protect, bordering a country proverbially noted for its conquests, revolutions and the ungovernable traits of its rapacious subjects; filled with one of the fiercest and most warlike tribes of America's aborigines; and a victim to the most unrelenting force of circumstances of perhaps any other portion of our country. It is a marvel that the Territory shows the progress it does.

The Apaches are the most powerful and warlike tribe of Indians that the Government has perhaps ever had to bring its forces against. Ever since 1853, we have been more or less afflicted with them, for as early as that had the American pluck found its way into that rich seclusion of the Sonora country. In that year and with the purchase of our last acquisition to the Territory we also got, in the bargain, or as a legacy, a powerful tribe of wild, ferocious, unsubdued Indians, whose daily life consisted in hunting after, killing or torturing all human victims not of their own kind or kin. They had been at this since the time of the Spanish conquest, and had excelled. They had successfully repelled Mexico after her independence and until our purchase in 1853. Since then they have, we might say, fought us successfully also. It would have been money in our pockets if after the purchase we had turned around and offered the Mexicans the price of the whole purchase over again to have taken their munificent legacy back, if this could have been done.



COLLEGE OF MINES, UNIVERSITY OF CALIFORNIA.

The Colleges of Mines and Mechanic Arts, at Berkeley.

We present in this issue a cut of the new building on the grounds of the University of California, at Berkeley. This building is to be occupied by the Colleges of Mines and Mechanic Arts. Both of these colleges are to be great factors in the advancement of the industries of our coast. The necessity of some high authority on mining subjects is very apparent to all. In the midst of a country with such mineral resources as ours possesses, is it not preposterous to think of our yielding for many years longer to Germany as authority on matters relating to mining? Germany herself has to come all the way to the Rocky mountains to obtain information on many ores and processes. The Germans work the subjects up and our young men spend years in Europe studying what they should be able to learn at home. High reference, authorities and educators, our universities should be.

And it is the aim to make the College of Mines of the University of California such an authority and educator. It is in the hands of men who have studied their departments both in Germany and America.

As this should be a subject of absorbing interest to our readers, we do not hesitate to give quite fully the general remarks on the college found in the "Register of the University" for the current year: The four years' course of instruction leads to the degree of Bachelor of Philosophy. Students who desire to receive the degree of Mining Engineer must continue their studies for at least two years more, and must exhibit to the Faculty satisfactory evidence of their power to apply, in actual work, the knowledge they have acquired.

During the first two years of under-graduate work, the studies of the course are the same as those of the other scientific colleges in the University of California. During the last two years the attention is directed chiefly to chemistry, metallurgy, mining, geology, mineralogy, and mechanical and civil engineering, though the study of modern languages is also kept up. The scientific studies are taught, as far as possible, with reference to their applications in mining, and the entire work of the last two undergraduate years and the post-graduate course is overlooked by the lecturer on metallurgy and mining, under whose special guidance the mining students come.

The post-graduate years are devoted mainly to the study of mining and metallurgy, including studies on the spot of mines and smelting-works, and essays embodying the results of observation.

Opportunities will be afforded to the class to visit some of the industrial establishments of San Francisco, and they will be encouraged to extend their visits to mining and metallurgical works at a distance.

The laboratories for work in chemistry are new, extensive and well furnished. They afford excellent opportunities for becoming proficient in analytical chemistry.

A metallurgical laboratory, designed to offer the very best facilities for the study of assaying, and to contain machinery and other appliances for the study of metallurgical processes, has been built during the past year. Its equipment will be commenced immediately.

The engineering instruments and the physical apparatus are also of the best kind.

There is a collection of beautiful models of furnaces, as well as one of furnace products.

The collection of ores, fossils and minerals are remarkable.

We may also add that endeavors are now being made to increase the efficiency of the mining college, by the procuring of an ore deposit collection.

PARLIAMENT has adjourned until Feb. 13th.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

How to Avoid Failures in Lixiviating.

By OTTOKAR HOFMANN.

The lixiviation proosss is without doubt one of the best and cheapest processes we have for beneficiating argentiferons ores, especially as it is adaptable to a certain class of ore ou which amalgamatiou proved to be a failure, or too expensive to be profitable, hut like any other process it is not suitable for all kinds of ore; and to avoid failure it is necessary that the person te whom the process is intrusted should be a first-class metallurgical chemist. But this is very frequently not the case, and Mr. W. T. Rickard, in his communication, is correct to attribute the failures in Utah, Nevada and California to this fact. Our mining companies, instead of engaging an accomplished metallnrgist, as a rule prefer, for the sake of saviug a few hundred dollars' salary, the so-called practical millmen—men without any chemical knowledge, hut good, strong muscles to give a helping hand around the mill wherever it is needed. If our mining companies wonld appreciate scientific knowledge more, and would not expect it combined with the ability of hard manual labor in the same individual, they wonld do much better, and save thousands of dollars. I know men without the least chemical knowledge, hnt practical millmen of the sort as above mentioned, who worked for me in Mexico, where I introduced first the lixiviation process, to have been intrnsted with the erection of lixiviation works, and made a hrilliant failure, and with ore, too, which could be treated to the best of advantage by this process. The inability of the men in charge is the only cause of failures.

As mentioned above, not all kinds of ore can be treated by the lixiviation; some work better by amalgamation, some by smelting; and in order to avoid failnre, the proper process has to be selected before the works are erected, and not afterwards, as it is often done.

The principle on which the lixiviation process is based, consists in the property of hyposulphite of lime or soda to dissolve readily chloride of silver. The extraction of the chloride of silver is performed by permitting the solution of either of these salts to filter through the ore, but the solutiou dissolves only that part of the silver which is in the state of chloride; and therefore, in examining an ore of its qualificatiou for this process, we have to find first how many per cent of the silver can be chloridized by roasting. This cau be done with a few ponnds of ore, and the resnlt obtained by experimenting, if favorahle, is guaranty for snccess in a large scale, as the chloridizing roasting with a larger quantity of ore is usually better, while the result of the leaching is in hoth instances ahont the same. In fact, the lixiviation process is nothing else but our chloridizing test executed on a large scale, and extracts the chloride of silver as close as the latter.

If the ore contaius more than 12% to 14% of lead, lixiviation is not the proess for it, for two reasons: first, lead ores do not chloridize well; and, second, the chloride of lead formed in roasting dissolves very slowly in water, but readily in hyposulphite of lime or soda, which increases greatly the consumption of chemicals, and decreases the finsness of the bullion. Ores oontaining argentiferous fahl ore, iron-pyrites, eopper-pyrites, zincblende, silver-eopperglance, and some galena, can be worked successfully by the lixiviation.

If the ore has beeu found by experiment to roast well, the next important question to deeide is, how it filters. The time required for extracting the silver depends greatly on the rapidity of filtration. The quicker the filtration, the shorter the operation. Experience tells us, that if leaching is interrupted, and the ore left in contact with the solntion over night, the solution dissolves but very little more silver during this long contact, thau it would have done by simply passing through the ore. Again, the small stream from a slow filtering ore is hut a trifle more concentrated than the lively stream of a good filtering ore. There are several devices for improving the filtration, as: connecting the space under the false bottom with a suction pump, or a syphon; applying pressure, or using agitators; but all these improvements might fail to work if there is too much clay or slate in the ore. The safest way will be to remove the cause of the non-filtration. At Trinidad, Sonora, Mexico, the ore contaius so much clay that loaching was almost out of the question. To mix it with sand or fine cut hay did not remove the obstacle. In order to obtain sucoess I had to crush coarse, change dry crushing into wet crushing, separate the slimes from the sand, treat the slimes by amalgamation and the sand by lixiviation. Good, concentrating machinery does away with the necessity of using amalgamation; but, as the case was at Trinidad, where I had bsen obliged to use only common tanks of different sizes for separating, amalgamation was necessary.

Roastod ore filters much better than raw ore, and therefore, in ascertaining the quality of an ore in regard to filtration, it ought to be subjected to the test after it is roasted. The experiment should be made in a small hox or hucket with false hottom, and not in a paper filter and funnel.

Coarser crnshing facilitates filtration greatly, without injnring the resnlt. In 1868, when I erected the first leaching works at La Dura, Mexico, I used screeu No. 60, gnided by the principle, that fine pulp would permit a closer extraction of the chloride of silver; but gradually substituted coarser screens till I reached No. 30, and afterwards No. 27, obtaining in each case the same resnlt. Even screens No. 18 are used successfully. The advantages of coarse crushing are: increase of the crushing capacity of the battery, less formation of dnst, and improved filtration, consequently qnicker operation.

Of great importauce, too, is to ascertain the loss in roasting. Some antimonious ores sustain a loss of from 10 to 20 and more per cent. In such a case a proper modification of the roasting has to be adopted in the beginniug.

If these precautions are taken, and the result ohtained by the experimeut is favorable, the lixiviatiou will prove a success, provided it is intrusted to the hands of a competent metallnrgist; for even the best working ore can he maltreated by incompetency to such an extent as to cause failure.

The construction of lixiviation works and the mechanical operations of the process are very simple, which iuduces many amateurs to try their expertship, for which, as a rule, the companies have to pay very dearly. There is a large leaching work in Nevada, where the water extracting the base metals carries out so much silver, that the whole of the base metals are precipitated with sulphide of calcium, in order to avoid a heavy loss in silver. The precipitate that is obtaiued assays up to $1,600 per ton. The ore containing only $40 to $50 per ton, and, being rich in base metals, the consnmption of chemicals in proportion to the ponnd of silver produced is not a very favorable one. The hase metals (of the chloride) always dissolve some silver, which loss, however, can be reduced to a minimum if properly managed, and the idea of precipitatiug the whole of the base metals is ridiculous.

At the Advance mill, Monitor, Alpine county, California, where I treated coucentrations, obtained by Frue's concentrators, and consisting of iron-pyrites, silver-glance, silver-copperglance, zincblende and some galena, assaying $250 silver and $30 gold per ton, the water containing the base metal chlorides dissolved some silver. The burned precipitate, obtaiued by precipitating a part of the base metal solution with sulphide of calcium, showed by assay a content of $103.70 per ton. After a slight modification of the process, without any increase of cost, the precipitate contained only traces of silver. The result obtained with Advance ore by lixiviation was 96% and the bullion 864 fine.

A combination of the lixiviation process with concentration works is in successful operation, at the Old Telegraph works, Utah. The ore containing chloride of silver is snbjected first, to lixiviation and then to concentration, in order to extract the chloride of silver, which previously was lost in concentration. This combination would work to great advantage at many of our Arizona mines.

Reclaiming Land from Shifting Sand.

EDITORS PRESS:—Some years sinee, on the coast near San Francisco, I had eccasion to inquire into the cause of so much sand heing drifted inlaud from the ocean, and a means of preventing its drifting. I observed that the waves were at all times making for the shore, which brought clean fine sand, and deposited it by slow degrees on the long, sloping, sandy beaches, and when the water receded, as it does with every ebb tide, the new deposit is dried by the sun and constant breeze; and as the wind is mostly inland, the sand which is dried is drifted by a slow process, but which is daily increasing and in years will make the great sand hills and drifting sands that are to be seen near to, and even in, the city.

It being desirable to stop fnrther drifting of sands on the coast, and you having suggested planting protecting trees, has induced me to bring forward a plan that may be worthy of a trial. It is to bnild a stone wall at, or near the highest point to which the tide rises, and the waves extend in, and with the wall sufficiently high to prevent the sands from blowing over the top. The hight could be soon learned from the dry sands which would drift inward to it. I believe the wall would not be costly, and that it would be an effectnal barrier to the drifting sand, also a protection to the growing trees and grasses. Respectfully, ENGINEER.

Eureka, Nev., Dec. 9th

THE PARIS AND THE CENTENNIAL SHOWS.—The Paris exhibition, which was kept open 194 days, did not produce as much money from admission fees as the Centennial exhibition, which was opened only 159 days. The reported receipts at Paris (12,653,746 francs) would represent the number of paid admissions at one franc each, the general price of admission was doubtless somewhat less, as there were higher rates of admissiou for some days, and for some hours of each day. The receipts of the Centennial exhibition from admission fees amounted to over $3,800,000, against $2,530,000 at Paris, during a one-third greater number of days.

Tracking Crime with the Microscope.

H. C. Hyde, Presideut of the California Microscopical Society, in a paper recently read before the society, on the subject of "The Microscope in Medical Jurisprudence," mentions the following cases in which the microscope aided in the detection of the criminal.

Some years ago there was a case of child-murder in France. The child had been killed by cutting its throat, and a knife supposed to have been used in the commissiou of the deed, was found in the possession of the accused. A careful examiuation showed what were believed to be blood stains, in a crevice between the blade and handle, which had been overlooked in the cleausing process which the knife had gone through, and the substance was submitted to an able microscopist, who, after a thorough investigation declared that the snbstance was human blood; that it was blood from the regiou of the throat—this fact determined by the presence of the epithelial scales peculiar to the fances, and, furthermore, there were found fragments of rabbit fnr. This array of facts was conclusive of the use of that knife in cutting the throat of the murdered child—the additional circumstance being elicited that at the time of the killing the child had a rabbit-fur tippet abont its neck. Confronted with these discoveries, the prisoner confessed her guilt (this unnatural monster was a woman) and was executed.

Another case, which I have met somewhere in my reading, but cannot now recall all the facts, was where the accused attempted to prove an alihi, and would have been successful, but for the fact that his boots were covered with a whitish mud, and it occurred to the authorities to have this examined hy a competent microscopist. The examination showed that the whitish mud was diatomaceous earth, and absolutely identical in its contained forms with a deposit close to the spot where the crime had been committed. This conclusively disproved the alihi; at least, so far as the boots were concerned. The general result of the case I have forgotten.

Bullion Product of Montana.

Mr. W. C. Childs, Wells, Fargo & Co.'s agent at Helena, furnishes the company with the following estimate of gold and silver product of the Territory during the fiscal year, as shown hy the shipments by express and other sources:

BY EXPRESS FROM	GOLD.	SILVER.
Helena	$ 780,000	$ 495,000
Butte	77,000	660,000
Deer Lodge	315,320	55,700
Virginia	416,000	.....
Bannock	92,150	6,350
Salisbury and Lovell's	1,450	14,544
	$1,681,920	$1,231,594
Amount carried out privately	100,000	
Amount remaining in hands	100,000	
Silver in base bullion		450,000
Silver in ores (shipped)		400,000
Total	$1,881,920	$2,081,594
Grand total	3,963,514	

While the above is douhtless a correct showing of the shipments, it is not a correct showing of the localities where the gold and silver was produced. The Penohscot ore is all credited to Helena. Nearly the entire silver product of Philipsburg goes to Helena by private hands, and shows in the shipments only from that point. We believe all the product of the Lexington mill at Butte first shows as hullion in the shipment from Helena, and the same is largely the case with the gold melted and put in bars at the Government assay office. Dear Lodge county is much the largest bullion-producing county in the Territory, but the abeve method of reporting the shipments does not convey the fact.—*Exchange.*

HOW TO TEST GLUE.—Glue to resist well a damp atmosphere should contain as little saline matter as possible. When buying the article, ventnre to apply your tongue to it, and if it tastes salt or acid, reject it for any but the commonest uses. The same operation will also bring out any bad smell the glue may have. Those are very simple and ready tests and are the usual ones by which dealers and large consumers form their judgment. Another good test is to soak a weighed portion of dried glue in cold water for 24 hours, then dry it again and weigh. The nearer it approaches to its original weight the better glue it is, thereby showing its degree of insolubility. Other practical tests may easily be devised, such as glueing up tests pieces of wood and submitting them to trial. In short, "the proof of the pudding," etc. Color is not a safe criterion for glue. Its adhesion and lasting properties depend more upon what it is made from, and the method of securing purity in the raw material, for if that is inferior, and not well cleansed, the product will have to be unduly charged with alum, or some other antiseptic, to make it keep during the drying process. Weathered glue is that which has experienced unfavorable weather whilst drying, at which time it is a rather delicate substance. The Scotch makers attend particnlarly to the purification of the raw material, and put a comparatively small proportion of antiseptics in their glue—not snfficient to be apparent to the taste afterwards, bnt which, in ordinarily good weather, is enough to carry it through the drying process. Should foggy or drizzly weather intervene, however, moldness sets in, and the glue becomes weather-beaten.

Colorado Geology.

Some New Discoveries Concerning It.

Prof. Denton, the eminent geologist, contributes the following interesting article to the Denver *Tribune:*

Having recently found a bed of interesting fossils, which shed additional light upon the formation of the Rocky mountain chain, I take this opportunity of placing the facts before your readers.

At the close of one of my lectures in Fort Collins, Dr. Bennet, of that place, informed me that small fossil shells had been found near Bonner spring, immediately above and almost close to the granite. On visiting the spot, 18 miles northwest of Fort Collins, I found in a short time a number of casts and impressions of shells, principally spirifers, with some specimens of the orthis and impressions of bryozoa, in pebbles of fine-grained quartzite and, judging hy the contained fossils, apparently of devoniau age. After a careful examination of the snrrounding rocks, I discovered that the pebbles had been derived from a bed of conglomerate, lying directly upon the granite, in the imbedded pebbles of which I found other fossils of a similar character to those found in the loose gravel.

This discovery assists in filling up a wide gap which previously existed in the geological history of the Rocky mountain range.

The geological formations below the tertiary are generally represented in the following order: Cretaceous, jurassic, triassic, *carboniferous, devonian,* silurian, *laurentian,* metamorphic, granitic.

Those in italics had not been discovered in the Rocky mountain range of Colorado, and a great gap existed between the silurian and the triassic. For a large portion of the space on the eastern slope of the range in Colorado, the silurian had not even been identified, and between the metamorphic and triassic was a space entirely vacant representing many millions of years, during which we possessed no history of a large portion of the Rocky mountain chain. This discovery enables us to fill up a considerable portion of the chasm.

The conglomerate in which the pebbles are found, I regard as subcarboniferous. It resembles the conglomerate which underlies the coal measures in various portions of our own country and in Great Britian, and above it is a limestone composed almost exclusively of crinoidal fragments, resembling limestones of undoubted carboniferous age.

We are carried back then, first, to the devonian age, when the shells lived, whose remains have been found in the quartzite pebbles. We find an ocean where now mountains exist at a hight of 8,000 feet above the sea level. To the west there were mountainous islands wearing away, and the fine, sandy sediment was deposited by streams in the sea where shells abounded, and coral-like ,bryozoans spread their fans; one gencration living and flonrishing, becoming hnried hy fine, sandy sediment, followed by others in their turn. In process of time this fine sand, by the pressure of superincumbent material, was converted into sandstone, then by heat from helow into quartzite, and the buried shells and bryozoans became fossils. What had been the hed of the ocean became rocky mountain peaks and ranges, on which the rain fell and over which the rapid mountain torrents swept, breaking up the rocks and making pebbles of them, which were swept down into the carhoniferous sea at the bottom, of which the conglomerate containing the fossiliferous pebbles was formed.

I subsequently found similar fossils in the conglomerate several miles nearer to the north fork of the Cache-la-Poudre, and I have no douht that they occur over a wide extent. Captain Berthoud informs me that pebbles containing devonian fossils have been found in the Box Elder, though the locality from which they had been carried had not been found. As the locality where I found the fossils is within a few miles of Box Elder, that was probably their original home.

THE CON. ESMERALDA MINE.—We have just been shown a letter from T. V. Julian, the superintendent of the above mine, in which he says that at the bottom of their shaft, which is down in the vein to the depth of ahout 100 feet, they have cut into a body of ore that surpasses in richness everything heretofore found in their mine. The certificate enclosed of assays made in Reno make the average $518.59 per ton silver, with only a trace of gold. The silver is chloride, principally, and the gangue carries but a small percentage of base metal. Three hundred tons of ore taken from this shaft and worked by mill in the city, yielded $32.50 per ton. The pulp assay being $56.00 per ton, shows that it was worked only to 57%. The body of ore from which this rock was taken is 25 feet thick, but in width and depth its extent is not known. This property is situated in Reno mining district, Washoe county, Nevada, and incorporated in this city, office 309 Dupont street.

ASPHALT FOR SKATING RINKS.—A Philadelphia paper says that roller skating over the asphalts has become popnlar, and the attendance of ladies and gentlemen at the rink, twenty-third and Chestnut streets, to indulge in this pastime increases constantly.

FORTY-FOUR indictments have been found at Yanktown, D. T., against Livingstone and other Indian agents.

MECHANICAL PROGRESS.

The Philosophy of Welding.

Alexander L. Holley recently read a very interesting paper before the Philadelphia Institute of Mining Engineers, from which we give the following extracts: The generally received theory of welding is that it is merely pressing the molecules of metal into contact, or rather into such proximity as they have in the other parts of the bar. Up to this point there can hardly be any difference of opinion, but here uncertainty begins. What impairs or prevents welding? Is it merely the interposition of foreign substances between the molecules of iron, or of iron and any other substance which will enter into molecular relations or vibrations with iron? Is it merely the mechanical preventing of contact between molecules, by the interposition of such substances? This theory is based on such facts as the following:

1. Not only iron but steel has been so perfectly united that the seam could not be discovered, and the strength was as great as it was at any point, by accurately planing and thoroughly smoothing and cleaning the surfaces, binding the two pieces together, subjecting them to a welding heat, and pressing them together by a very few hammer blows. But when a thin film of oxide of iron was placed between similar smooth surfaces, a weld could not be effected.

2. Heterogeneous steel scrap, having a much larger variation in composition than these irons have, when placed in a box composed of wrought-iron side and end pieces laid together, is (on a commercial scale) heated to the high temperature which the wrought-iron will stand, and then rolled into bars which are more homogeneous than ordinary wrought-iron. The wrought-iron box so settles together, as the heat increases, that it nearly excludes the oxidizing atmosphere of the furnace, and no film of oxide of iron is interposed between the surfaces. At the same time the enclosed and more fusible steel is partially melted, so that the impurities are partly forced out and partly diffused throughout the mass by the rolling.

The other theory is, that the molecular motions of the iron are changed by the presence of certain impurities, such as copper and carbon, in such a manner that welding cannot occur or is greatly impaired. In favor of this theory it may be claimed that say 2% of copper will almost prevent a weld, while, if the interposition theory were true, this copper could only weaken the weld 2%, as it could only cover 2% of the surfaces of the molecules to be united. It is also stated that 1% of carbon greatly impairs welding power, while the mere interposition of carbon should only reduce it 1%. On the other hand, it may be claimed that in the perfect welding due to the fusion of cast-iron, the interposition of 10% or even 20% of impurities, such as carbon, silicon and copper, does not affect the strength of the mass as much as 1% or 2% of carbon or copper affects the strength of a weld made at a plastic instead of a fluid heat. It is also true that high tool steel, containing 1½% of carbon, is much stronger throughout its mass, all of which has been welded by fusion, than it would be if it had less carbon. Hence copper and carbon can not impair the welding power of iron in any greater degree than by their interposition, provided the welding has the benefit of that perfect mobility which is due to the fusion. The similar effect of partial fusion of steel in a wrought-iron box has already been mentioned. The inference is, that imperfect welding is not the result of a change in the molecular motion due to impurities, but of imperfect mobility of the mass—of not giving the molecules a chance to get together.

Should it be suggested that the temperature of fusion, as compared with that of plasticity, may so change the chemical affinities as to account for the different degrees of welding power, it may be answered that the temperature of fusion in one kind of iron is lower than that of plasticity in another, and that as the welding and melting points of iron are largely due to the carbon they contain, such an impurity as copper, for instance, ought, on this theory, to impair welding in some cases and not to affect it in others.

The obvious conclusions are: 1st. That any wrought-iron, of whatever ordinary composition, may be welded to itself in an oxidizing atmosphere at a certain temperature, which may differ very largely from that one which is vaguely known as "a welding heat." 2d. That in a non-oxidizing atmosphere heterogeneous irons, however impure, may be soundly welded at indefinitely high temperatures.

The next inference would be that by increasing temperature we chiefly improve the quality of welding. If temperature is increased to fusion, welding is practically perfect; if to plasticity and mobility of surfaces, welding should be nearly perfect. Then how does it sometimes occur that the more irons are heated the worse they weld?

1. Not by reason of mere temperature, for a heat almost to dissociation will fuse wrought-iron into a homogeneous mass.

2. Probably by reason of oxidation, which, in a smith's fire especially, necessarily increases as the temperature increases. Even in a gas furnace a very hot flame is usually an oxidizing flame. The oxide of iron forms a dividing film between the surfaces to be joined, while the slight interposition of the same oxide, when diffused throughout the mass by fusion or partial fusion, hardly affects welding. It is true that the contained slag, or the artificial flux, becomes more fluid as the temperature rises, and thus tends to wash away the oxide from the surfaces; but inasmuch as any iron with any welding flux can be oxidized till it scintillates, the value of a high heat in liquefying the slag is more than balanced by its damage in burning the iron.

3. But it still remains to be explained why some irons weld at a higher temperature than others; notably, white irons high in carbon, or in some other impurities, can only be welded soundly by ordinary processes at low heats. It can only be said that these impurities, as far as we are aware, increase the fusibility of iron, and that in an oxidizing flame oxidation becomes more excessive as the point of fusion approaches. Welding demands a certain condition of plasticity of surface; if this condition is not reached, welding fails for want of contact due to mobility; if it is exceeded, welding fails for want of contact due to excessive oxidation. The temperature of this certain condition of plasticity varies with all the different compositions of irons. Hence, while it may be true that heterogeneous irons, which have different welding points, can not be soundly welded to one another in an oxidizing flame, it is not yet proved nor is it probable that homogeneous irons can not be welded together, whatever their composition, even in an oxidizing flame. A collateral proof of this is, that one smith can weld irons and steels which another smith can not weld at all, by means of a skillful selection of fluxes and a nice variation of temperatures.

PROTECTING IRON.—A new method of protecting iron has recently been introduced, which is described as follows, by *Iron:* The method is to coat the surface to be protected with a thin film of borate of lead having a little oxide of copper dissolved in it, and having also suspended in it bright scales of precipitated platinum. A red heat is employed to fuse the composition, which is either applied with a brush or employed as a bath, in which small articles may be dipped. Its effect is, to cover the iron with a thin glassy coating of a bright gray tint, not far removed from that of polished iron itself, and unaffected by sewer gases, dilute acids and alkalies, and the heat of a kitchen fire. Modifications of the compositions give the means of imparting different colors to the coating, and these are as easy of application as the platinum gray just mentioned. The effects are really very good, and show how ornamental an iron grating of neat pattern, or an iron frieze might be in front of a gallery in a large building, or in any equally elevated position. Cost is in all cases a most important feature of preservative operations. We are told that the cost of platinizing is about equal to that of applying three coats of paint, and about one-tenth of that of electro-plating with nickle.

STEEL BOILERS.—We lately alluded to the use of steel in boiler making. A late number of *Engineering* sums up the result in England of the employment of steel as follows; "That of some 80 boiler makers who have fairly tried steel plates, only some eight or nine can be said to have persevered with its use and used it extensively; that when the use of steel plates has been persevered in against the advice and feeling of the boiler maker the result has generally been unsatisfactory; that it may be taken for granted that the prejudice on the part of boiler makers against the use of steel, is, as a rule, inversely proportionate to the extent of their acquaintance with it." The same article estimates that there are working in the United Kingdom about 2,500 boilers with steel shells and 7,000 with steel furnaces and fire-boxes. It is impossible to tell, says the *Iron Age*, how many are in use in the United States, but the number is far in excess of this, and steel for this purpose is rapidly growing in favor with boiler makers. This is also true in England. The great facility with which low steel can be made by the Siemens-Martin process is doubtless one cause of this increased favor, put the breaking down of prejudice is another.

STEEL WIRE ROPES are coming more and more into use on shipboard, in mines and for other purposes. An Eastern exchange, in alluding to their introduction on the great lakes as tow lines, speaks of one 660 feet long, and weighing only 800 lbs. Steel traction ropes are used by three street railroads in this city to haul the cars over our high hills. The California Street railroad employs a wire 1,800 feet long, which was made in two pieces of 900 feet each, 1¼ inches in diameter. The Clay Street road employs a wire made in a single length, 11,000 feet long and one inch in diameter. All these wires were made by A. S. Hallidie, of this city, from the best English crucible steel.

ORNAMENTAL WORK ON ENGINES.—The movement to replace the brass ornamental work on engines with plain black finish has progressed very rapidly within a few years, effecting a saving which in the aggregate must be very considerable. It is true that an engine presenting to view an unrelieved black from pilot to tender does not have that splendor of appearance given by highly colored brass and brilliant gilding and striping, but it seems to draw just as well, and the road does not show any falling off of passengers or freight on account of the plainer finish.—*Railway Age.*

SCIENTIFIC PROGRESS.

New Researches into Chemical Action.

Prof. Dewar recently read a most interesting and instructive paper before the British Association of Science, wherein he gave a somewhat detailed account of some late researches into the chemical action which takes place under great degrees of heat and pressure. This study, accompanied by numerous and carefully conducted experiments, has been most fully pursued by Prof. St. Clair Deville, of Paris, and has resulted in greatly modifying many previous ideas of metallurgical interactions. It has enabled chemists to study with much precision the action of high temperatures and pressures as they exist in the sun, and to explain many apparently abnormal reactions in the earth's crust, which have heretofore been quite inexplicable. These reactions relate to both gases and solids. Experiments show that every vapor has a certain curve that represents all its relations—namely, the increase or diminution of pressure to the temperature; and that the behavior of solid bodies is strictly analagous to that of vapors.

In a limekiln, where heat is employed without pressure, caustic lime is produced, and carbonate of lime cannot exist. In experiments made with a tube, when great heat can be applied under a pressure of some 80 or 100 atmospheres, carbonate of lime is readily produced. This experiment shows how carbonate of lime may have been formed in the presence of great heat in the early geological ages of the earth, when such heat might have been accompanied with the required pressure. Similar abnormal chemical reactions were shown by the lecturer in the treatment of gases and vapors.

We continually hear of discoveries, by astronomers, with reference to the condition of the solar atmosphere. These discoveries and experiments under consideration open a new and important field for investigation into the character and conditiou of the body and atmosphere of the sun. They tell us of the efficacy of sudden explosions and reactions under enormous pressures and in the presence of high temperatures. The result may be, and doubtless is, that hundreds of bodies are formed to-day and decomposed to-morrow, into an enormous number of still other new ones, simply from variations in pressure and temperature, as the masses of matter ascend from the lower to the higher regions of the sun's body and atmosphere. No doubt we shall have proof of the truth of these assumptions, in the discovery that there are certain lines in the solar spectrum suddenly produced and as suddenly disappearing, so soon as the spectroscope is turned to a careful study of the sudden explosions which the telescope has recently informed us are constantly taking place upon the sun's surface. Such lines can only be due to the sudden formation and transformation—not of elementary bodies—but of temporary compounds. This subject is one of wide generality, and promises to add much to the interest and importance which attaches to the many brilliant and important discoveries which have recently characterized chemical and philosophical research.

A Third Form of Carbon in Steel.

The subject of a third form of carbon in steel is beginning to attract considerable attention among practical chemists and metallurgists. It is considered a very important matter, and one which is worthy of receiving a much larger share of attention than has hitherto been accorded to it.

It appears to have been first noticed by Mr. S. A. Ford, a practical chemist of Philadelphia, as early as 1875, and was explained by him at a meeting of the American Institute of Mining Engineers, in June, 1876. Mr. J. Blodgett Britton, of Philadelphia, also noticed the fact at about the same time, and reference was also made to it in the *Metallurgical Review* for October, 1877.

Mr. Henry G. Debruner, of Pittsburg, Pa., in a recent communication to the American Iron and Steel Association, in alluding to this new form of carbon in steel, says:

If crucible or Bessemer steel is dissolved in nitric acid, 1.2 sp. gr., a brown flocculent body is observed to float in the resulting solution, which, on the heating of the latter, will prove soluble, as every one is well aware who ever made an Eggertz carbon test. If graphitic or non-combined carbon be present it will remain undissolved, even on heating for hours on the water-bath, and will neither be affected by alcohol nor on treating with diluted solutions of alkali.

If "German steel," blister bar, or converted steel be subjected to the action of nitric acid as above, a greenish solution is obtained, in which a heavy velvet black powder is observed to accumulate in the bottom of the vessel. It looks exactly like graphitic carbon, but essentially differs from the latter by being perfectly soluble on the heating of the solution.

These facts led me to further investigations, and finally made me adopt the theory of a third allotropic modification of carbon in steel, in which I consider it to exist in this case in a semi or half-combined form or state. Mr. Debruner does not seem to have been aware of the previous notices of this new form of carbon in steel.

Wine-Testing by Aid of Photography.

Probably one of the most curious of the many uses to which photography may be applied is that of which we read in a recent number of the *L' Italia Agricola.* A few drops of wine are dropped upon card-board and photographs taken of the stain. These, when examined under a microscope, will not only reveal what particular kind of wine they represent, but also the exact condition in which the bulk of such wine may be at the moment of observation. It is known that wines have a sort of second life, not only when in bottle, but also under other conditions, and it seems that these photographs of wines possess the same nature, and at various epochs in their vegetative life exhibit in a similar manner the successive stages through which the wine itself is passing. Every year the wine undergoes a transformation, which the photograph faithfully indicates, and which can be studied on the latter, by the aid of a microscope, in its minutest details. It is a fact not generally known that in wine-testing the eye is far superior to the palate as a guide. The dealers of Bordeaux, for instance, in busy seasons have so many varieties to sample that their sense of taste soon loses its sensibility, and the "palate" refuses to serve them, but the eye will preserve its delicate discriminating power unimpaired for days and days together. And this system of photography of wines, which is capable of rendering immense services, will sooner or later be generally adopted.

HEAT EXPERIMENT.—In the French Academy, recently, M. Hirn called attention to a curious case he had observed of heating of a bar of iron. The bar (about 1m. long and 0.08m. diameter) was being held by a workman on another piece, while a second workman hammered its free end. At each stroke the workman holding the bar found that it suddenly became greatly heated, then suddenly cooled. M. Hirn, on holding the bar, had a like experience, and, to his great surprise, the sudden variation of temperature seemed to him nearly thirty-five degrees. He was surprised because a calculation of the work done did not seem to give any thing like a heating effect. The phenomenon is best observed when the bar is seized very near the free end. M. Hirn considers the effect in question to be of a wholly subjective character—that is, one of sensation. The source of heat, indeed, on careful observation, seemed to reside in the interior of the hand, not at the surface of the metal. He thinks sonorous vibrations may, in certain circumstances, cause, at the periphery of the body, a sensation of heat, just as a blow on the eye or pressure there may awaken the sensation of light. He suggests, however, to make the experiment of examining the state of the bar (when struck) by means of a Melloni thermometer.—*Eng. Mechanic.*

INTERESTING EXPERIMENT.—M. de Chancourtois, Professor of Geology at the School of Mines in Paris, has devised an experiment to illustrate the formation of ridges of hills by risings in the crust of the globe while still soft from the primitive heat. M. de Chancourtois represents the globe by an inflated rubber ball, which takes the place of the terrestrial nucleus in fusion, destined to contract on cooling, and, by its shrinking, to produce on the surface the elevations and depressions which constitute the mountains and valleys of the existing earth. The ball is dipped in a bath of melted wax, and, when that has partially set, a small portion of the air is allowed to escape by the tap. The surface of the sphere then contracts slightly, and sinks in portions, wrinkling the wax. When a little more air is allowed to escape, these slight wrinkles become more distinct, and form ridges and hollows precisely analogous to the ranges of hills and valleys on the face of our planet, except that their relief is relatively greater. M. de Chancourtois lately presented to the Academy of Sciences two of these balls, one in the first stage of the operation and the other in the second or final one.—*Engl. Mech.*

ABSORPTION OF CARBONIC OXIDE BY LIVING ORGANISMS.—N. Grehaut has experimented with mixtures of air and minute portions of carbonic oxide. He finds that a man or an animal, when compelled for half an hour to breathe an atmosphere containing only 1-779 of carbonic oxide, absorbs that gas in sufficient quantities to saturate about half of the red globules of the blood, so that they become incapable of absorbing oxygen. In an atmosphere containing 1-1449 of carbonic oxide, about a quarter of the red globules are similarly saturated. These results are interesting and important in relation to physiology and hygiene.—*Comptes Rendus.*

IMPROVEMENT IN WATCHES.—A notable improvement in watches is reported from Chaux de Fonds, Switzerland. By a peculiar process the figures on the dial are rendered luminous, so that if exposed once during the day to the sunlight they remain phosphorescent and visible throughout the night. According to *Nature*, preparations are being made for the production of these watches on a large scale.

Mining Share Market.

People are thinking more of Christmas and New Year's, than of the bundles of certificates in their safes. The market is extremely dull with scarcely any fluctuations from the level reached in the crash. Stocks gradually settle lower and lower, if they move at all, and the great break seems to have been sufficient lesson for two or three weeks at least. There is no noticeable falling off in bullion shipments, and no remarkable increase of assessments. Dividends are not startling in number. On the whole, a general quiet seems to have settled down upon that part of the mines that exists in our city—a quiet more apparent than real, and to be broken, the insiders know when. Such state of things might exist for a long time and yet, we believe, orders for mining supplies would come just as thick and just as fast, in fact would improve. "The market is not the mine." We have received a specimen of metal for determination, from the southern part of California. Mr. J. S. Phillips, 508 Washington street, reports it to be antimony, with traces of lead and iron and a *slight trace* of silver.

News in Brief.

INDIAN Territory is improving.

BUSINESS is prostrated in Odessa.

FRESH freshets at the East.

THE British government is sustained by Parliament.

THE Russians will evacuate Adrianople in January.

ONE hundred thousand dollar robbery at St. John, N. B.

LAST week the barge *Grand Island*, en route from Colusa to San Francisco, grain laden, sprung a leak and sunk while passing Red Rock.

IN the Cuban elections the Liberal Conservatives were successful in the greater bart of the island.

THE manager of a private bank, in England, lost $3,000,000 of the bank's money during November.

EFFORTS are making to impeach Henry W. Blodgett, Judge of the United States Court at Chicago.

MRS. APPLEGATE made an unsuccessful attempt to take her own life lately at Walla Walla. W. T.

A SINGULARLY well-executed counterfeit of the standard silver dollar has made its appearance at Chicago.

IT is reported that Coukling announces himself as irrevocably for Grant as the next Presidential candidate.

THE Northern Pacific Railroad Company have struck an eight-foot nine-inch vein of coal at Wilkeson, W. T.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

THE VOLCANO TUNNEL.—*Dispatch*, Dec. 14: The work on this gigantic structure is progressing steadily but slowly—being pushed in at the rate of only about one foot and a half per day. The tunnel is eight feet in the clear, and is now in a little over 1,200 feet, being a fraction over one-half the whole distance to be run. The expenditure thus far has reached $70,000, and it will take nearly as much more to reach the basin for which they are drifting.

STEWART'S QUARTZ MILL.—This mill, which is situated about two miles below Volcano, and which has been lying idle for about a month undergoing a thorough renovation and repair, was again set in motion last Tuesday afternoon. It is now probably one of the neatest and best little ten-stamp mills in the county. A large quantity of rock from the Downs mine is now being crushed at this mill, which, to judge from the looks of the ore, will yield at least $40 or $50 per ton. The mill will be kept running on custom rock for some time to come, as there are several quartz mines being opened in the vicinity.

THE MOORE MINE DITCH.—Work was commenced on the ditch which is to convey water from the Oneida mine to the Moore mine, last Wednesday morning. We understand that about 45 or 50 men are employed on this work, at $2.25 per day per hand. As the ditch cannot be more than 4 or 5 miles in length, it will not require much time to complete it. The More M. Co. will construct the ditch, when, it is understood, the Amador Canal Co. will buy the ditch and pay for it with water furnished to the mine. The ditch will be of sufficient capacity to furnish water for other mines when required—being built two feet in depth, and three feet wide at the top and two on the bottom.

ITEMS.—Work has again been commenced on the East Keystone and Niagara mines. At the depth of about 12 feet, a 7-foot ledge has been struck running through both these mines. Work on the Tellurium mine, situated at the edge of Pine Grove, on the road leading to Volcano, is rapidly progressing, and the prospects continue very flattering. The company seem to have confidence in the permanency and richness of the lead. Work has again been commenced on the Bismarck mine, situated between Jackson and the Mokelumne river, by Messrs. Vaughn & Champion.

BUTTE.

BIG BAR.—Oroville *Mercury*, Dec. 13: Big Bar H. Co. is the title of a corporation at present engaged in operating on North Fork, 30 miles above here. The stockholders are principally residents of this city. Organized two years ago, the company purchased the ground now being worked, but has labored under great disadvantages. During the past summer, however, it was decided to change the base of operations, and instead of attempting to reach the main deposit in a roundabout way to construct the necessary flumes, etc., and attack the bank direct. This plan has been carried out, and two chiefs are now in position ready for water. It was by reason of a belief in the richness of this bank that the company was induced to buy the property. As an evidence that this opinion was well-founded, it is only necessary to state, upon the authority of Mr. J. J. Smith, that two men recently panned out $70 in one-half day; while a lot of seven pans yielded an ounce each. The latter is regarded about the average quality of the ground.

CALAVERAS.

THE COLLIER MINE.—*Citizen*, Dec. 14: The Collier mill near Murphy's, has just started up, on some of the richest rock ever worked in the county. This enterprise will give a new impetus to the mining interests of that section, which is now filled with prospectors, who report the country wholly undeveloped, but one of the most promising districts in the State.

THE WILLARD MILL.—A new mode of working and milling ores is about to be introduced in Calaveras county. The Willard mill at Robinson's ferry, in the Carson mining district, now in course of erection, is likely to create a revolution in the mode of working ores heretofore found rebellious, but which under treatment of the Willard process readily yields from 90% to 95% of the assay value. The process is not an expensive one, just what has long been needed in Calaveras county to make quartz mining a profitable business. Many a mine can be opened and successfully worked when it is certain that even 90% of all the gold contained in the ore can be saved.

MARIPOSA.

HORNITOS.—Mr. Joseph Frank Thorn of Hornitos reports to the Mariposa *Gazette* of Dec. 14th, as follows: The Jersey mine, owned by A. Campodonico, the mill upon which was destroyed by fire not long since, has been bonded for six month to Mr. Thomas McGlew. Mr. McGlew has erected a new five-stamp mill, which it is expected will be ready for crushing rock by the middle of next week. This mine is looked upon as being one of the best in that section. No. 9 vein and mine is one of the oldest and best known mines in the districts of Hornitos and Quartzburg. It is owned by Frank Thorn. He has recently erected thereon a 8-stamp mill, which is expected to crush from eight to 10 tons of rock per day; the rock from this mine pays about $10 per ton, and is taken from a shaft 40 feet deep, sunk on the side hill, which strikes the vein 250 feet below its outcrop.

NORTH FORK MERCED.—*Gazette*, Dec. 14: The mining interests of this neighborhood are looking up. There are a number of mines being successfully worked at present, among which may be named as the principal ones, the Banderita and Martin Walling, both owned by Joshua Hendy & Co., of San Francisco. Mr. Hendy employs at present at the Banderita, about 25 men. He is building a 10-stamp mill, which will be provided with all the modern improvements. The new mill will be ready to commence crushing rock about the middle of January. The mine is looking well, as they have a vein of rich rock, three feet wide, and about 200 tons of ore on the dump, and are taking it out at the rate of 10 tons per day. At the Martin Walling mine they have a force of about 20 men at work; they have sunk the main shaft 70 feet deeper, which gives it a present depth of 350 feet. They have started two levels from the bottom of the shaft, one north and one south, to strike the pay chutes. They are also sinking a winze in the north second level, and have a vein two and one-half feet in width, of rich rock; they have about 150 tons of ore on the dump. The Thomas mine has out 100 tons of rock, and will start their mill as soon as the rains furnish sufficient water.

MONO.

CON. PACIFIC.—*Alpine Chronicle*, Dec. 7: The two principal veins in this ground, so far as known, and the only ones which the company have thoroughly developed, the Pacific No. 1 and Pacific No. 2. The Pacific No. 1 lies about 20 feet west of the boundary line between the Con. Pacific and Belvidere ground. It is a fine, strong, well-defined, true fissure vein of gold-bearing quartz, unmixed with porphyry or other barren rock, and varies from 18 inches to 3½ feet in width. This ledge has been developed by an open cut along the croppings for nearly 100 feet from the McClinton line, south to a depth of from 10 to 20 feet. Many thousands of dollars were taken from this open cut, the ore having worked in the old bull team and arastra days over $200 per ton. At the south end of the open cut a shaft has been sunk on the ledge, 45 feet deep, from the bottom of which, drifts have been run about 25 feet north and south, all in good milling ore. The ledge has been cut also in a crosscut from the No. 2 tunnel at a point under the bottom of the shaft, and a winze is now being upraised from this crosscut into the shaft for air. The ore from this vein is being mixed with ore from the Pacific No. 2, and hauled to the Miner's mill for crushing, and there can be but little doubt that after the air connection is completed the No. 1 alone can furnish good milling ore enough to keep this mill running constantly. The Pacific No. 2 has been well developed by a tunnel commencing nearly 400 feet down the hill southward from the north end of the claim, and which runs theuce north along the vein into the hill a distance of 255 feet, where the crosscut above mentioned branches off east to the No. 1. The No. 2 is a small, rich ledge, varying from 10 to 16 inches in width. Free gold may be seen in this with the naked eye, all through the dump, and a great proportion of the rock assays well up in the thousands. The company is now breasting out a station on the east side of the tunnel for the purpose of sinking a winze in rich ore body, and we may expect magnificent results as greater depth is attained. The Pacific No. 3 and the Sharon ledges, belonging to the same company, lie west of the No. 2, but have not been developed further than by the amount of work required by the mining laws of the United States and the local regulations. The Sharon, however, is a well-defined vein of 10 inches, and prospects throughout in fine gold, but the ore is low grade. Thorough development may prove it equal to the No. 2, which it very much resembles in appearance.

The following is from the Bodie *Standard*, Dec. 11:

CHAMPION.—The shaft is down 486 feet. The bottom of the shaft is in favorable working ground. The formation has entirely changed; are in ledge matter, which is improving as advance is made. Both the east and west crosscuts are looking well. Will open station and commence crosscutting on the 500 level. Everything is looking well and running in fine order. The winter supplies are all laid in, which insures that work will be prosecuted with energy during the coming winter.

SYNDICATE.—The south drift has been advanced 28 feet during the week. The rock has become harder. The small seams of quartz running in the drift are enlarging as advance is made south. In the west crosscut a progress of 17 feet has been made during the week. The rock is growing softer, of birds-eye porphyry. The seams that are crossed show more quartz and less feldspar, and the indications are better. The mill is running steadily on Bodie ore.

WINDSOR.—Shaft down 60 feet, struck the foot-wall at a depth of 30 feet, from which point an incline was run following the wall. At 60 feet a drift was commenced east and run in 10 feet, where a well-defined hanging wall was struck. Material passed through composed of quartz mixed with clay and resembling that found in Bodie mine.

SITTING BULL.—The company are engaged in stoping out the ore from the old shaft, and shipping it to the mill. About two tons per day are taken out. The new shaft has struck the ledge at a depth of 81 feet. The ledge is about two feet wide, and is of about the same character as in the old shaft.

MAYBELLE.—The west crosscut from the 300 level is in 42 feet. Have cut two or three streaks of ore, which prospect in gold. Three shafts are working in this crosscut, and work is being advanced as rapidly as possible.

SHASTA.

FURNACEVILLE.—Reading *Independent*, Dec. 12: The Peck and also the Afterthought mine were several years ago located as copper mines; but it has been found that the ores yield a much greater profit by working them for the silver and gold that they carry in addition to the copper. The Peck mine, in quantity and quality of ore, is second to none on the coast. There is over 15,000 tons of ore in sight, and over 2,000 tons of ore out and ready for reduction. The ore assays on an average $25 per ton in gold and silver, and 4% of copper. The ledge is from 20 to 50 feet wide, the best ore laying against what is supposed to be the hanging wall. The hanging wall is porphyry, and the foot wall slate. The ore is a carbonate and sulphuret, and some oxides and chlorides near the surface; but at 20 feet in depth it becomes mostly sulphurets, with a very little gangue which is spar. The Peck mine, and also the Afterthought, had tried several different processes for working their ores, but none gave satisfaction until the Afterthought Mining Co. erected reduction works for reducing the ore and obtaining the gold, silver and copper separate. But they had only time to prove the process a success, when, unfortunately, the works took fire and burned down. They have now started to rebuild their works, with greater capacity to work, with some little improvements and the addition of the Peck mine.

COPPER CITY.—The Extra mill is running day and night on good ore, and there is plenty of this kind of ore in sight to keep the mill busy for a long time to come, to say nothing of the new strike in the way of copper ore, which is four feet wide and will average 25% copper. The Potter mine improves finely as greater depth is reached, holding its uniform thickness and good quality of ore. When this mine is opened to a depth of 500 feet, and its levels all properly run, there can be 200 tons of ore extracted from it daily with the greatest ease. The tunnel at the Northern light mine is being driven into the mountain as fast as possible, and everybody is anxious to see Messrs. Whitney and Dunn strike their ledge, as they feel sure of an immense bonanza at this depth, as the ledge was very large and rich in the tunnel above. The Winthrop company are pushing their tunnel ahead.

DEADWOOD.—McConnell & Dorr are now taking from their mine on the west fork of French Gulch creek some excellent ore. Mr. McConnell hand-crushed 14 pounds of rock that yielded two ounces of gold. Kearn & Shay, on the east fork of French Gulch creek, have a well-developed mine and are now running their arastra on high-grade ore. They are now running a tunnel 150 feet to strike the ledge over 100 feet below where they are now working. George Klein is not working his ledge at present, but is crushing ore with his two arastras for Phillips & Wiley. They have out ready to mill nearly 100 tons of ore. M. Sebastiau has probably the best developed ledge on Deadwood. The face of the ledge now shows 10 feet in width of rich ore. He has now sacked and ready to haul to his arastra 60 or 70 tons of ore. I understand his last run netted him $150 per ton. Frick & Davis have just struck a rich ledge; it is now over two feet in width, and assays $70. Should it hold out it will be one of the best mines in Deadwood. James Trotter has got a good prospect in his mine. He has a seam in one of his tunnels which is widening and produces ore enough to run his arastra.

SIERRA.

ITEMS. — Downieville *Messenger*, Dec. 14: The Pliocene shaft is within a few feet of pipe-clay. The company are running a short tunnel, about 50 feet long, to intersect the shaft some 30 feet below the mouth into which they will, when completed, pump the water. We understand that some work is being done on the Mt. Veruon claims, in Mt. Veruon ravine.

NEVADA.

WASHOE DISTRICT.

CALIFORNIA. — Gold Hill *News*, Dec. 18: Daily yield, 360 tons of ore. The face of the south drift from the Ophir has passed into a much softer and more favorable character of ground, showing quartz plentifully mixed with porphyry. The north drift on the 1950 level is now in a distance of 233 feet, the face is still in a very fine vein formation. The upraise from the west drift, from No. 6 winze on the 1650 level, is up 26 feet, the face is still in quartz and ore of a low grade.

OPHIR.—Daily yield, 60 tons of ore. This amount will probably be gradually increased during the coming week to between 70 and 80 tons per day. The ore is of a good quality, and is being shipped to the Brunswick mill, on the Carson river, for reduction as fast as it is taken out.

UTAH.—Sinking the main incline is making good progress, the bottom having passed into bird's-eye porphyry of a favorable character.

NEW YORK.—The west crosscut for defining the width of the ore vein, 200 feet north of the main shaft, has reached the west wall and has

Continued on page 396.

The Martin White Case.

[Continued from last week.]

But the rules of the district were revised on the 1st of October, after the passage of the act of Congress, and the provisions with respect to the notice and record of claims were readopted without any additional provision for bringing them into sensible relation to the law. They do not purport to supply a means of holding a claim pending the marking of the location on the ground, but stand as substantive and independent requirements, a compliance with which is essential to the validity of a claim. We are not willing under the circumstances to go to the extent of holding that their observance can be dispensed with, even where a location has been plainly marked before the making of an adverse claim. We will assume that it was necessary for the locators of the Paymaster not only to have marked their location before the Shark locators complied with the law, but also to have posted and recorded a notice of the claim. Did they do so?

There can be no question that the original Paymaster notice was all that the law requires. The only objection to it is that it did not contain in itself a description of the claim by reference to some natural object or permanent monument. It was not necessary that it should. It is only the record of the claim that is required to contain such a description; and there are excellent reasons for making a distinction between the notice and record in this particular. A notice is generally, and for safety ought always to be, posted immediately upon the discovery of the vein, before there is any time to survey the ground and ascertain the bearings and distances of natural objects or permanent monuments in the neighborhood; and besides, the claim referred to by the notice is always sufficiently identified by the fact that it is posted on or in immediate proximity to the croppings. A notice claiming a location on "this vein" has only one meaning. But the notice is exposed to the danger of removal by adverse claimants, or destruction by the elements, and for permanent evidence of the location its record is provided for. The record, if it consisted of a mere copy of the notice, would not identify the claim, and there would be an opportunity as well as a temptation to the locators, upon the discovery of a more valuable mine in the vicinity, to prove, by perjured witnesses, that their notice was posted on that mine. The floating of claims was by no means an infrequent occurrence prior to the act of 1872, and if such attempts were seldom completely successful, they were always vexatious and often the means of levying a heavy blackmail. It was on this account that the *record* (not the notice) was required to contain "such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim" (R. S. 2324). It is a sufficient compliance with this provision of the law if the description of the *locus* of the claim is appended to the notice when it is recorded. But by reference to the foregoing statement of facts, it will be seen that not only did the record of the Paymaster location contain the necessary description—it was also contained in the body of the notice as posted on the ground: "Situated about 1,500 feet N. W. by N. of the 'Mountain Pride lode,'" is the description in the notice; and as no objection to it was made upon the ground that the "Mountain Pride lode" was not a well-known natural object, at that distance and in that direction from the Paymaster location monument, we presume it was, in fact a good description. The record also contained the names of the locators and the date of the location, and thus fulfilled every requirement of the Act of Congress. (R. S., 2324.) But was changed by Ward and Henry, and it is contended that after those changes it was no longer a good record.

The argument in support of this point is about as follows: Pearson, whose name was in the original notice, as first recorded in the little book, was one of the locators of the claim; he had a vested right, and could not be deprived of his interest by the erasure of his name from the notice and record, and consequently after his name was scratched out the record no longer contained the names of the locators, and was void. We do not think it is by any means clear that Pearson ever acquired an interest in the claim. It does not appear that he ever assented to the use of his name as a locator by Ward, who actually made the discovery and posted and recorded the notice, and it does not appear that there was some sort of argument by which Ward was to divide his discoveries equally among those whose names were afterwards signed to the notice. If Pearson had no right to share in the discovery, and if Ward merely inserted his name by mistake or under some misapprehension, and erased it before the claim had been perfected by work or the marking of its boundaries, it is difficult to see upon what ground he could claim to have ever had any vested right as a locator. But whether he had or not is a question between him and the other locators of the Paymaster. As to outsiders, the notice and record were sufficient. They contained the names of those who claimed to be the locators and served every purpose of the law—that is, they identified the claimants and the claim.

The subsequent alteration of the notice by changing the words westerly and easterly to northerly and southerly had no effect upon the rights of the parties. The only purpose of those words was to show in which direction from the discovery point the claim extended 1,200 feet, and in which direction its extent was only 300 feet. Either set of words served the purpose equally well. No doubt when the vein was first discovered its course seemed to be east and west; after a certain amount of development it seemed to run north and south, and the notice was changed for the perfectly innocent and even laudable purpose of giving to all whom it might concern a better description of the claim. The corresponding alteration in the record was made with the same motive, at least the court finds that it was done without any fraudulent intent; and certainly it was immaterial. There was no swinging of the location effected by this change in the notice and record. The claim was never fixed until the stakes were set; and so far as the notice was concerned it claimed 1,500 feet of the vein, no matter where it might run. If it was good for anything it was good for what it claimed pending the marking of the location. The changes and erasures in the record were certainly irregular, and if they had been material, or if they had not been satisfactorily explained, might have afforded good grounds for excluding it from evidence.

But they were satisfactorily explained. They were not designed to defraud anyone, and had no such effect. We think that the comments of the District Judge on this matter are very just. Mining recorders are a class of officials that must be treated with a great deal of forbearance and indulgence. They are often entirely ignorant of legal forms, and have no appreciation of the horror with which an ordinary lawyer views the erasure or alteration of records and other documents. Where no fraud or deception is intended their blunders must not be construed into crimes.

Man's Place in Nature.

In "Man's Place in Nature," by Prof. Joseph LeConte, the writer contends that evolution is the grandest idea of modern science, embracing every department of nature, its law as universal as the law of gravitation, the one being the universal law of time, as the other is of space. In the evolution of the organic kingdom, there may be much difference of opinion as to the causes or factors, and also as to the rate of evolution, whether always uniform or more or less paroxysmal; but of the fact of the progressive movement of the whole organic kingdom to higher and higher conditions, there is no longer any doubt. The formal laws of continuous movement are the essential elements of the evolution theory, and for these we are indebted to Agassiz. Although to his latest utterances Agassiz contested modern views, he was himself, according to Prof. LeConte, "the great founder and apostle of evolution." All the laws of the evolution of the organic kingdom, as now recognized, were announced by him. His whole life was devoted to enforcing these laws, though he denied the existence of any discoverable cause except the First Great Cause. He regarded the organic kingdom as a great work of art, wrought out according to a plan predetermined in the mind of God; and says Prof. LeConte, "he was undoubtedly right." Darwin, on the other hand, attempted to discover the secondary causes by means of which this marvelous result was attained. To him the organic kingdom was an immense and complex organism developed under the action of resident forces; and "he also, as I conceive," says Prof. LeConte, "was right." Agassiz announced the formal laws of the universe of time, as Kepler did those of the universe of space; Darwin, like Newton, though with less success, attempted to determine the causes of these formal laws. Agassiz is undoubtedly the Kepler of the time-universe; but the honor of its Newton must be divided among many, though Lamarck, Darwin and Spencer are certainly the pioneers. In the remainder of the article the author discusses the question of materialism as the theory of human nature, arguing its inadequacy as an explanation of admitted phenomena, and its want of support in the legitimate conclusions of science. The views presented by Prof. LeConte, in the conduct of his argument, are as original as they are ingenious, and will doubtless challenge the attention of scientific thinkers to whom they are especially addressed.

U. S Entomological Commission.

The United States Entomological Commission, attached to the United States Geological and Geographical Survey of the Territories, has issued its first report on the Rocky mountain locust, or destructive grasshopper of the West, a volume of some 700 pages, fully illustrated with maps, plates and wood-cuts. The favorable predictions made by the commission last winter had an encouraging effect, and stimulated the immigration to the country of late years ravaged by locusts. The statement which a full survey of the field enabled the commission to make in advance, viz., that there would be no serious injury in 1878, has been fully verified. The commissioners have continued their labors during the past summer, confining their attention to that northwestern portion of the country which they have designated as the "Permanent Region," the object being to gather further knowledge of that region, with a view of preventing the ravages of the Rocky mountain locust therein and its migration therefrom.

The problem of destroying the young insects as they hatch out in the more fertile country in the southeast is virtually solved in the report which the commission has already issued; and the task which they now undertake is to endeavor to prevent the migration of the winged insects from the permanent region into the more thickly settled country.

An appropriation of $25,000 was asked of the last Congress for the completion of the work mapped out, and $10,000 were appropriated, and this only toward the end of the fiscal year. The commissioners ask for the additional sum of $15,000, in order that they may be able to continue their investigation until the practical work is accomplished. It was too late in the season when the last appropriation was obtained to permit the completion of the work this year, but with such means as they have husbanded added to the additional appropriation asked for, and with promised assistance by the Dominion authorities, they will be enabled, by getting into the field early the coming spring, to complete fully the work assigned to them.

New Incorporations.

BEAVER CONSOLIDATED M. Co.—Location: California. Capital, $10,000,000. Directors—John P. Culver, N. B. Childs, J. J. Foster, Fred Schumacker and F. M. Biber.

SWAMP ANGEL M. Co.—Location: Nevada county. Capital, $300,000. Directors—C. K. Kirby, C. W. Badger, W. P. Sargent, A. K. P. Joy and G. P. K. Walker.

STATE M. Co.—Location: California. Capital, $102,500. Directors—J. H. Mayuard, A. H. Clough, H. K. White, W. H. Olmstead and S. D. Woods.

MAGENTA M. Co.—Capital, $10,000,000. Directors—C. J. Hutchinson, Andrew J. Moon, Chas. Joost, John F. Lohse, and Louise Franconi.

CAHAWBA G. M. Co.—Capital, $30,000,000. Directors—C. W. Kellogg, H. L. Coye, F. W. Hadley, J. J. Morie, Isaac D. Huntoon.

NOB HILL G. AND S. M. Co.—Object: to mine in Nevada, California, Utah, Arizona, and elsewhere. Capital, $10,000,000. Directors—G. G. Garibaldi, John A. Younie, William J. Gray. William W. B. Sheldon, and Jas. D. McMurray.

ATLAS M. Co.—Intention: To mine in Utah. Capital, $10,000,000. Directors—Adolphus H. Noon, E. B. Jago, M. Goldman, R. H. Nasou and A. F. McGrew.

ARTICLES of incorporation of the Massachusetts Silver Miners' company were filed in the County Clerk's office in New York, November 29th. Also articles of incorporation of the Arizona mining company, with $10,000,000 capital.

HOLSTEIN CON. G. & S. M. Co.—Capital, $10,000,000. Directors—J. G. Edwards, J. Howell, F. E. Patton, Amos Roberts and C. K. Hobbs.

ARTICLES of incorporation by the Central Arizona mining company were filed in the County Clerk's in New York, November 29th. Capital, $10,000,000. Among the Trustees are A. L. Hinton, L. W. Knevals, A. Mitchell, W. E. Wallace and Noah Brooks.

GERMAN G. M. Co.—Intention: To mine in El Dorado county. Capital, $5,000,000. Directors—C. H. Baker, F. W. Ainsworth, William H. Reynolds, Warner Craig and N. E. Shaver.

SAN PEDRO G. & S. M. Co.—Location: Calaveras county. Capital, $10,000,000. Directors—John L. Peters, Isaac J. Holmes, J. C. Barlow, Philip L. Weaver and William McKenzie.

THE Rex Montis mining company has increased its capital stock from $320,000 to $10,000,000.

MONTE CRISTO G. M. Co.—Intention: To mine in Tuolumne county. Capital, $10,000,000. Directors—A. J. Bryant, Thomas Pendergast, D. A. Macdonald, William Corcoran and W. P. Humphreys.

WALKER M. & M. Co.—Intention: To mine in Bodie district. Capital, $3,000,000. Directors: Thomas B. Pheby, T. J. Powers, John Kane, William N. Jacobs and O. H. Bogart.

THE Tyho Con. mining company has increased its capital stock from $10,000,000 to $15,000,000.

CHICAGO M. & M. Co.—Capital, $10,000,000. Directors—Anthony C. Hesing, John A. Rice, Frederick Hess, George L. Hoods and Edward S. Solomon.

SCIENTIFIC RELIANCE ON SOAP.—Dr. Richardson lectured recently in Philadelphia on the germ theory of disease. He acknowledged his obligation to Tyndall for his microscopic investigation on air, dust, spores, and other comforting and salutary topics. It is worth while for common people to learn that 50,000 typhus germs will thrive in the circumference of a pin head or a visible globule. It is worth while for them to note that these germs may be dessicated and be borne, like thistle seeds, everywhere, and, like demoniacal possessions, jump noiselessly down any throat. But there are certain things spores cannot stand, according to the latest ascertained results of science. A water temperature of 120° boils them to death, and soap chemically poisons them. Here sanitary and microscopic science comes together. Spores thrive in low ground and under low conditions of life. For redemption, fly to hot water and soap, ye who live in danger of malarial poisoning. Hot water is sanitary. Soap is more sanitary. Fight typhus, small-pox, yellow fever with soap. Soap is a hoard of health.

THE ENGINEER.

Harbor Bars, Their Formation and Removal.

At a meeting of the Society of Engineers, held on Monday evening, November 4th, in the Society's hall, Victoria street, Westminster, a paper on "Harbor Bars, their formation and removal," by Mr. Henry F. Knapp, of New York, was read. After some observations upon the importance of every port having an adequate outlet for its commerce, the author proceeded to observe that bars had been divided into three classes, chiefly, viz., delta, drift and wave. He maintained that all bars and shoals in broken or rough water, should be treated in reference to wave-action, as that was the sole cause of their formation. Engineers had largely accepted the theory of narrowing the channel of a delta-forming river by jetties as the great cure of bar formation in its entrance. That theory, to the author's mind, had no feasibility to recommend it. He observed that the amount of wave-action of water depended on two causes—viz., wind and depth of water, both of which modified it from the extreme of smooth water to that of mountainous billows; and as engineers cannot control the winds from causing wave-action, they must modify wave-action itself, so as to deepen bars and prevent bar formation. To carry this theory into practice for the prevention of the formation of harbor bars, as well as to remove those already formed, which the author does on the theory of interference to wave-action; he proposes to construct a barrier directly across the mouth of a river or harbor on the outside of its bar, in a depth of 50 or 60 feet of water, and having a hight of from 20 to 30 feet above the bed. As the hight of this barrier is the only quality necessary to produce the required interference to wave-action, the thickness need only be measured by the solidity necessary to withstand the force that it is intended to detract from the waves. This barrier, according to the author, will not offer any impediment to the free discharge of the waters of the river, but on the contrary will protect and facilitate that discharge. Neither would it offer any impediment to vessels passing in and out at all times, as its top would be lower than that of the bar. Its sole use would be to destroy the building-up power of the waves, leaving unimpaired the full force of the river to cut out the bar.

Field Work of the Hayden Survey for 1878.

We have received from Washington some advance proof sheets of the forthcoming report of the work of the Hayden Survey, from which we extract the following: During the past season the work of the United States Geological and Geographical Survey, under the direction of Prof. F. V. Hayden, was continued northward into portions of Wyoming and Montana Territories. The usual appropriation for the survey was not passed by Congress until July, rendering the field season very short, yet the results were of considerable magnitude and of much importance.

The survey proper was divided into four parties, one of which was devoted to the extension of the primary triangulation to the northward, two were engaged in topographic and geologic work, and the fourth performed photographic and special geologic duty. All the parties left the Union Pacific railroad from Point of Rocks and Green River stations about July 25th, and proceeded northward toward the Yellowstone National park. To the second division was assigned the duty of making an exhaustive survey of the park and its surroundings, and to the third the exploration of the Wind River range and the Snake River country. The primary triangulation was extended over about 12,000 square miles. Eight primary stations were occupied, among them Wind river, Fremont's and Grand Teton peaks, which are among the most difficult and hazardous of ascent on the continent. This division would have performed double this amount of work had a band of hostile Indians not robbed it of its entire outfit about the middle of the season.

The second division made a very detailed survey of the National Park, securing the materials for the preparation of a topographical and geological map on a scale of one mile to one inch. The geologist not only studied the geology minutely, but also sketched every square mile of the area. An unusually interesting and valuable collection of volcanic rocks and hot-spring specimens was obtained. The entire collections of the survey, which are of a varied character, will amount to about three tons weight.

The third division explored with equal care the Wind River and Teton ranges of mountains, a region of which comparatively little was previously known. The peak named by the survey Fremont's peak was found to be over 14,000 feet in hight above the sea, with no trace that any human being had ever previously reached its summit. Three complete glaciers were discovered on the east side of the Wind River mountains, the first ever known to exist east of the Pacific coast. The old glaciated rocks and morainal deposits were found on a remarkably grand scale in both the Wind River and Teton ranges.

The object of again surveying the Yellowstone

park was to bring it under the system of triangulation which had been employed with so much success in Colorado and to make the entire work uniform. All the old hot-spring basins were resurveyed in great detail, and several new ones were discovered and mapped. Soundings and temperatures of several thousand hot springs were taken. The history and habits of the geysers were carefully studied.

The photographer of the survey obtained over 50 fine views of the bowls and other curious ornamental details of the Hot springs.

The results of the season's labors, though a short one, have been on the whole very satisfactory. About 12,000 square miles of very difficult country were surveyed, much of it in minute detail, and a mass of observation secured for the twelfth annual report, which will make it of more general interest and value than any of the preceding.

The district assigned to this survey by this department for the next Atlas comprises all the area of the Territories of the United States north of latitude 41° 4' east of meridian 117° and west of meridian 94°. It is estimated that the mapping of this area will occupy five years more, and when this is completed the survey will have mapped over one-fourth the territory of the United States west of the one hundredth meridian.

THE GIBRALTAR TUNNEL.—The proposed tunnel between Spain and Africa is still before the public. This tunnel, according to the plan at present contemplated, is to extend from within a short distance of Algeciras, on the Spanish side, to between Tangier and Ceuta on the African side. The length of submarine tunnel will be nine miles, with an inclination of one foot per hundred, and the approaches will have an extent of six or seven miles. The greatest depth of the sea is 3,000 feet; and, as it is intended to have a thickness of some 300 feet of rock left between the roof of the tunnel and the sea bottom, the greatest depth of the tunnel will thus be 3,300 feet below the level of the sea. —*Am. Architect.*

Burning Coal Dust.

We give the following remarks from an exchange, on the subject of burning coal dust and small coal:

Although the problem of burning coal dust is one of apparent simplicity, it is in reality found to be a most difficult one to solve. No doubt by making the dust extremely fine, and using only the dust of highly bituminous coal, the problem is so far simplified as to permit a simple solution, for such dust will burn in much the same way as the vapor of petroleum. Such limitations to the problem, however, deprived its solution of all practical utility, as bituminous coal, reduced to so impalpable condition as to burn like a gas, is necessarily very costly. The plan, however, of causing the dust to circulate continuously until wholly burnt, supersedes the necessity of using bituminous coal, and of providing for its impalpable pulverization; and under the arrangement indicated, any moderate degree of fineness will suffice, such for example as is attained by passing slack through rollers. It is also immaterial whether bituminous or anthracitic coal is used.

After all, however, the question arises, whether it is advantageous to pulverize small coal before burning it, and whether it is not on the whole simpler to employ a species of furnace which will burn the small coal at present regarded as refuse, without further preparation. To enable such coal to be burnt on a grate, several precautions are necessary. Of these the first that the bars of the grate shall be very thin and the air spaces very narrow, so as to prevent the small coal from falling through. An endless web of bars, which shall receive the small coal continuously at one end, and advance it continuously until the clinker is discharged in front of the bridge at the other end, has been tried, and seems to be a convenient arrangement. If the coal is bituminous, some stationary plows or scarifiers must be set across the furnace at that point where the bitumen begins to melt, to stir the coal in that situation, and thus prevent the particles from so sticking together as to prevent the access of air. If the coal is anthracitic these plows will not be necessary, and they should be so fitted that they could be easily introduced or removed.

It appears to be quite practicable by this arrangement to burn refuse coal without smoke, and if the dust is so fine as to run through the grate like sand, it may be wetted before being used. A hopper may be carried across the front of the boiler containing an Archimedean screw, which will deliver the small coal upon each web of bars, and the action of these different webs being automatic, the combustion of the fuel will be effected without stoking, or the necessity of any one remaining in the engine room, which in the case of a war vessel, that might receive a shot in the boiler, it is manifestly an important object to attain.

ANOTHER convention between England and Turkey cedes to England Alexandretta, a seaport of North Syria.

THE Russians have claimed from the International Commission 23,000,000 francs for the expenses of occupation.

GRANT has concluded to visit Asia before returning to the United States.

Useful Information.

COLORING METALS.—A foreign paper gives the following: Metals may be rapidly colored by covering their surfaces with a thin layer of sulphuric acid. According to the thickness of the layer and the duration of its action there may be obtained tints of gold, copper, carmine, chestnut brown, clear aniline blue, and reddish white. These tints are all brilliant, and if care be taken to scour the metallic objects before treating them with the acid, the coloring will suffer nothing from the polishing. On making a solution of 640 grains of lead acetate in 3,450 grains of water and warming the mixture to 88 or 90 degrees, it decomposes and gives a precipitate of sulphuret of lead in black flakes. If a metallic object be immersed in the bath, the precipitate is deposited upon it, and the color produced will depend on the thickness of the deposit. Care must be taken to warm the objects to be treated gradually, so that the coloration may be uniform. Iron treated in this way has the aspect of bluish steel; zinc, on the contrary, becomes brown. On using an equal quantity of sulphuric acid instead of the lead acetate, and warming a little more than in the first case, common bronze may be colored of a magnificent red or green, which is very durable. Very beautiful imitations of marble may be obtained by covering the bronze objects warmed up to 100°, with a solution of lead thickened with gum tragacanth, and afterwards submitting them to the action of the precipitate spoken of above.

NEW SUGAR PROCESS.—Mr. F. J. Minchin writes: The specialty of the Robert diffusion process is that it requires no cane mills nor the immense motive power to work them, and that it gets out fully 20% more juice than by the use of mills. In this process the cane is cut in slices merely and steeped, so that out of the closed cells is taken the juice by the well-known law of exosmosis and endosmosis. Hence the juice is much purer, since it is freer of albumen and of the fermentable matters which are left behind in the cells. The purity of diffusion juice may be judged of by the fact that a clarifier of 560 gallons when defecated would not give "scum" sufficient to fill a slop basin. The drawbacks to diffusion are the large quantities of water required for its use (much of this can be utilized, however, for condensing purposes), and the addition to the juice of 20% or 30% of water, which means so much extra evaporation and so much extra cistern space; but a larger yield of 20% more than compensates for these minor disadvantages. The Aska Sugar Works, Madras, is the only spot in British dominions where this process is at work.

NEW METHOD OF FRUIT PRESERVING.—There appears to be no end to the long list of valuable properties with which salicylic acid is to be credited. The latest testimonials in its favor relate to its power of preserving fruit. The process as described by M. A. dal Piaz, of Klostermenburg, near Vienna, is extremely simple, and consists in laying the fruit in jars of syrup containing a small percentage of the acid. The proportions recommended are two or three grammes of salicylic acid and 100 to 500 grammes of sugar to a liter of water. No boiling or cooking of any kind is required. Berries and stone-fruit of all sorts thus treated will keep good for months together, or even years, without the slightest approach to fermentation, even when the vessels containing them are but insecurely covered, and will preserve their natural aroma unaltered. Boiled fruit-juices will keep equally well with the addition of one gramme of the acid to every two pounds of the juice, and with such addition the color of the latter is nor altered in the cooking. The only precaution needed is to secure pure crystallized acid of the finest kind, for the inferior varieties impart an unpleasant flavor to the fruit.

THE WORLD'S SUGAR PRODUCTION.—The annual production of the sugar of the world has been approximately calculated as follows: Bengal, China and Siam, 300,000,000 lbs.; British Colonies, 440,000,000 lbs.; Spanish Colonies, 470,000,000 lbs.; Dutch Colonies, 160,000,000 lbs.; Swedish and Danish Colonies, 20,000,000 lbs.; French Colonies, 160,000,000 lbs.; France (beet), 360,000,000 lbs.; Brazil, 150,000,000 lbs.; Zollverein (beet), 550,000,000 lbs.; Austria (beet), 178,000,000 lbs.; Russia (beet), 100,000,000 lbs.; Italy and Belgium (beet), 200,000,000 lbs.; all other sources, including the United States, 400,000,000 lbs.; total, 3,420,000,000 lbs. The annual consumption of sugar per head by different nations varies very considerably, as may be seen by the following figures, based on official data: In the United States, 33 lbs. per head; England, 30; Scotland, 30; Holland, 16; Ireland, 5; Belgium, 6; France, 6.66; Spain, 6.24; Switzerland, 6; Portugal, 5; Denmark, 5; Poland, 5; Prussia (Zollverein), 10; Norway and Sweden, 9; Italy, 2; Austria, 2; Russia, 1.

ALL STEEL BRIDGE.—The *American Manufacturer* says: The new steel bridge which is being erected for the Chicago and Alton railroad over the Missouri river at Glasgow, Mo., is to have five spans, and is to be entirely of steel made by the Hay process. Not even a nut is to be made of iron. This is believed to be the first large bridge ever built in which steel alone is used.

CAUTION AGAINST BASTIE GLASS.—The toughened glass of M. de la Bastie, which, upon its first appearance, created so great an interest, and not a little consternation in the glass trade, has scarcely justified the great expectations formed of it, and evidence of its unreliable character is from time to time forthcoming. Thus in the August number of the *Moniteur Scientifique*, M. J. Laurent, of Marseilles, cautions the scientific world generally, and chemists in particular, against the use of it. He considers the objects and utensils made of toughened glass to be no better than so many Prince Rupert's drops or Bologna flasks, from which they differ only by their shape. M. Laurent adduces an instance where a dish made of toughened glass was used at a stearine factory at Marseilles: it suddenly broke into thousands of fragments upon being placed on the metal scale of a balance. It was then in a state of cooling down from 110° C., at which temperature it had been maintained for some time; but it had previously been in use for about a month, and its sudden destruction was entirely inexplicable, save by the theory above mentioned.

HOW TO CLEAN ENGRAVINGS.—Soak the print in cold water till all creases are out and it lies quite smooth; then put into a dish containing a solution of chloride of lime with twice its quantity of clear cold water. When the stains have disappeared, put the engraving into plain water, and afterwards dry with blotting paper. For the solution referred to, put half a pound of chloride of lime into a vessel with one pint of water; let it stand, stirring it now and again, for 24 hours, and then strain it through fine muslin till quite clear, when the liquid is to be added to one quart of water. The prints should not be left in the solution longer than is necessary to remove the stains, and the more thoroughly they are washed in cold water afterwards the better for them, for it is liable to rot and destroy it. The wet print requires care in handling.

MAHOGANY SUPERSEDED.—Mahogany, heretofore the chief source of wealth in British Honduras, was during 1876 of such small value as not to repay the expense of cutting, and never probably since the occupation of the colony, with the solitary exception of the year 1870, was so little of this wood exported. Of logwood, on the other hand, owing to the exceptionally high prices of 1875, more was sent home during 1876 than in any year since 1864. In 1875, 1,587 tons of logwood, valued at £6,348 were shipped from the island of St. Lucia.

DYNAMITE AND WATER.—It has recently been shown that if dynamite is poured into water, the sand falls to the bottom and the nitro-glycerine floats on the surface, and explodes with its usual violence if the temperature is slightly increased. This will explain the cause of many of the serious explosions with dynamite when used in wet holes.

Good Health.

Color Blindness—Testing the Eyes of Railroad Employees.

Upon this subject the Philadelphia *Record* says: "Railroad accidents have been ascribed to many causes, but rarely, if ever, does the reader of public prints learn of an accident attributed to color blindness. And yet such a defect in the eyes of a locomotive engineer has caused disaster and death. Cases where one train follows up another and telescopes the rear cars are far more numerous than collisions where two locomotives butt against each other. In these days of double tracks, the latter are almost impossible. The other could be prevented at times if the engineer was able to distinguish the warning light ahead. But he cannot. He mistakes red for green and green for red; he confuses blue and green; he confounds almost everything except a white light. A colored flag that should stop him he discerns as one which indicates a clear track. The defect is therefore vital. Upon a trainman's ability to distinguish a signal depends the safety of the traveling public. To ensure this, and also to examine as to the proportion of population afflicted with color blindness, the eminent oculist, Dr. P. D. Keyser, Surgeon of Wills Hospital, has undertaken the task of testing the eyes of all the employees of the railroads that center in this city (Philadelphia). A reporter was curious to learn just what proportion of the trainmen were thus affected, so he called at the doctor's office last evening. In the parlor was seated a large squad of men from the Philadelphia, Wilmington and Baltimore line. The railroaders said that this examination of their eyes had been going on for quite a period.

The newsgatherer was kindly permitted to witness some of the examinations, as well as to have his own eyes tested. The important requisite for a railroader is to distinguish colors, because all signals are made with colored lamps or flags. In the tests the doctor uses all shades of wool and pieces of glass before a flame. The sharpness of vision in each case is also tested.

All railroad employees in Europe have undergone such examinations, with the discovery that about 2% of them were color-blind. It is a natural defect. People are born so, and sometimes never discover it until placed under an examination. In the public schools in this city a knowledge of colors is now taught in an effort to train the children's eyes and to remedy, if possible, any defect.

The subject is a rich one, and interesting to the multitudes of travelers. The doctor's investigations are likely to be productive of great results, and no doubt will lead to the adoption here, as in Europe, of one requisite in the qualifications of trainmen—a freedom from color-blindness.

[We understand that the managers of the Central Pacific railroad have already commenced testing the eyes of the employees, on the various roads under their management.]

THE SCIENCE OF LIFE.—How few of us acquire this science until we are old enough for life to have lost half its charms! The science of life consists in knowing how to take care of your health, how to make use of people, how to make the most of yourself, and how to push your way in the world. These are the things which everybody ought to know and which very few people do know. How never to get sick, how to develop your health and strength to the utmost, how to make every man you meet your friend, how to attach a few people to you as your bosom friends to be relied on in every case, how to earn money and save it, how to behave just as you ought to behave amid all the contingencies and unforeseen happenings of life, how so to live down your past if it is of such a character as to demand being lived down, how to manage yourself as to escape the entanglements of bad women and sincere friends, how to provide yourself, if you wish to do so, with a wife that will not be a burden and shame to you all the rest of your life, how to approach old age gracefully, so that you will not be a grief and reproach to yourself or others, how to make use of past errors and crimes, so that they may prove a help rather than a hindrance to you in the future; all these and many other things are to be included in the science of living, and the pity is that we only appreciate that science at its true value when the bloom of life is gone.

HOW DIPHTHERIA WAS SPREAD.—A few weeks ago a little girl in St. Albans, who had just recovered from diphtheria, was taken by her parents to visit a family in a neighboring town. She slept with the children in that family, and shortly afterward three or four of them were taken with the malady, and some have since died. The family permitted relatives and neighbors to visit them, and the result is several cases in the neighborhood. They had public funerals, even keeping the remains of one child an unusual time, waiting for another to die, so as to bury them together; and this also spread the contagion. The physician was not powerfully impressed—as some physicians are not—with the contagious character of the disease; therefore, he did not take the necessary precautions for the protection of the neighborhood or of his own family, and the result is that one of his own children has died and another is dangerously ill. A lady who went to one of these houses to robe the victims for the grave has called at houses in the vicinity where there are children, without any change of her garments or any attempt at disinfection, and has fondled the children in those families, apparently in utter ignorance of the danger to which she was exposing them.—*St. Albans (Vt.) Messenger.*

POULTICES.—The common practice in making poultices of mixing the linseed-meal with hot water, and applying them directly to the skin, is quite wrong, because, if we do not wish to burn the patient, we must wait until a great portion of the heat has been lost. The proper method is to take a flannel bag (the size of the poultice required), to fill this with the linseed poultice as hot as it can possibly be made, and to put between this and the skin a second piece of flannel, so that there shall be at least two thicknesses of flannel between the skin and the poultice itself. Above the poultice should be placed more flannel, or a piece of cotton wool, to prevent it from getting cold. By this method we are able to apply the linseed-meal boiling hot, without burning the patient, and the heat, gradually diffusing through the flannel affords a grateful sense of relief which cannot be obtained by any other means. There are few ways in which such marked relief is given to abdominal pain as by the application of a poultice in this manner.—*Dr. T. Lauder Brunton, in Brain.*

THE SANITARY EFFECT OF HOUSEWORK UPON WOMEN.—Many of the ills and diseases prevalent among women in our day are, no doubt, traceable to the sedentary mode of life so common among them. The progress with much of the household drudgery to which women were formerly subjected, and the result is, in too many cases, want of sufficient occupation for needed bodily exercise. The fruits of this state of things are strikingly exhibited in certain observations made by the late Mr. Robertson, a Manchester surgeon, who, in his practice as a specialist for women's diseases, found that in women who themselves performed all their work there was no trace of certain complaints; that these complaints begin to make their appearance in women with one servant, become more pronounced in women who have two servants, or worse still with those who have three servants, and so on. He showed statistically that the deaths from childbirth were four times greater in the case of women with four servants than those with none.—*Popular Science Monthly.*

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Picturesque Arizona; The College of Mines and Mechanic Arts, at Berkeley, 385. The Week; Unheeded Warning; The Press for 1879, Almaden Mines—No. 14, 392. The Bird of America; Iron Sleepers for Railroads; Asbestos in San Diego County, 393.
ILLUSTRATIONS.—College of Mines, University of California, 385. The White Headed or American Eagle; Rock's Improved Iron Sleeper, 393.
WHAT AND HOW?—Conquering Refractory Ores, 393.
MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 388.
MINING SUMMARY from the various counties of California, Idaho, Nevada and Oregon, 389-96.
NEWS IN BRIEF on page 389 and other pages.
CORRESPONDENCE.—How to Avoid Failures in Lixiviating; Reclaiming Land from Shifting Sand, 385.
MECHANICAL PROGRESS.—The Philosophy of Welding; Protecting Iron; Steel Boilers; Steel Wire Ropes; Ornamental Work on Engines, 387.
SCIENTIFIC PROGRESS.—New Researches into Chemical Action; A Third Form of Carbon in Steel; Wine-Testing by Aid of Photography; Heat Experiment; Interesting Experiment; Absorption of Carbonic Oxide by Living Organisms; Improvement in Watches, 387.
THE ENGINEER.—Harbor Bars, their Formation and Removal; Field Work of the Haydon Survey for 1878, 390-91. The Gibraltar Tunnel, 391.
USEFUL INFORMATION.—Coloring Metals; New Sugar Process; New Method of Fruit Preserving; The World's Sugar Production; All Steel Bridge; Caution Against Bastie Glass; How to Clean Engravings; Mahogany Superseded; Dynamite and Water, 391.
GOOD HEALTH.—Color Blindness—Testing the Eyes of Railroad Employees; The Science of Life; How Diphtheria was Spread; Poultices; The Sanitary Effect of Housework upon Women, 391.
MISCELLANEOUS.—The Paris and the Centennial Shows; Tracking Crime with the Microscope; Bullion Product of Montana; How to Test Glue; Colorado Geology; The Con Esmeralda Mine; Asphalt for Skating Rinks, 386. The Martin White Case; Man's Place in Nature; U. S. Entomological Commission; New Incorporations; Scientific Reliance on Soap, 390.

NEW ADVERTISEMENTS.

McDonald & Johnson's Stylograph; Bankrupt Stock o Watches For Sale, Walters Importing Co., Cincinnatif Ohio; Assessment Notice—Oriou Mining Co.; Hoskin's Deflector; Annual Meeting—Peacock S. M. Co.

The Week.

With the approach of the New Year men nerve their energies anew for more determined efforts in prosecution of success, and in remedy of failure. For us, citizens of the Union and of the Pacific coast, there could be scarcely a more hopeful season than is to usher in '79. The honor of our country is to be upheld. We are to pay our debt dollar for dollar, and before another week gold may be worth less than our promises to pay. The prosperity of our Coast is assured. The rains have held off long enough to encourage the farmer that there will be plenty of them within a month. But it is in the mining industry that we find most of interest. While the stock market languishes—a good sign, under some circumstances—the field of legitimate mining is widening, and men are hopeful. This is the tone from all our States and Territories. Some of our hydraulic miners have already water enough to commence work. The severity of winter is beginning to be felt in elevated camps. But the tireless industry of the past three months has prepared shelters and collected supplies, so that the cold and the wet shall not much interfere with development and product. There are failures reported continuously from the Old World. We have too many of them ourselves. But, in striking contrast to this falling away of old and unsound things, are the cheerful promises of activity to come, that may justify us in enjoying our holidays without touch of misgiving.

The "Press" for 1879.

We will continue in the coming year to endeavor to represent the mining and scientific interests of our coast. The PRESS for 1879 will contain articles of local and general interest on all subjects that come within our province. We shall make efforts to be of as much practical use to miners as possible. To this end we contemplate a series of articles on mineralogy and blow-pipe assaying, adapted both in style and matter to the every-day needs of the prospector and miner. We have tried to give heretofore the market price of metals. We shall render our list much more useful by quoting the price of ores of different metals and grades. In the interest of a new and attractive country, we shall present to the people a series of articles on Arizona, giving as far as possible new information concerning it, derived from reliable sources. On the second Saturday of January we will publish a supplement in which will be found a most interesting article on Sonora, Mexico, accompanied by a map. Also a very fully illustrated article on "Artesian Wells," lately read before the Academy of Sciences, by C. S. Gibbes, C. E. Among the illustrations is a section of the country made through San Francisco, Mount Diablo and Stockton to the foothills of the Sierra Nevadas. This will deserve special attention, not only from those who are seeking artesian water in the neighborhood of the regions treated of, but also from all interested in any way with artesian well supplies in general. In the line of purer science we can promise a paper by the Hon. Alex. Del Mar, entitled "The Evolution of Words," being really an addition to political economy.

By pursuing a policy of this kind in selecting matter for our readers, we hope to satisfy the wants of practical, every-day work, and at the same time the desire for higher culture which is the honor of Americans.

Unheeded Warnings.

Doubtless all who are within easy reach of the San Francisco mails, have before now read accounts of the fatal accident at the Guadalupe mine, Santa Clara county. When the cage, containing nine men, had reached a point between the 600 and 700 levels of the mine, the wire hoisting hand gave way at the drum, and the cage, burdened with its human freight, and loaded with 2,400 pounds of steel hand, fell to the dumps of the 700 level. Thos. J. Crocker was trampled upon and smothered to death in the water at the bottom. John Burney had his thigh broken; William Bennett one or two of his ribs. The others escaped with bruises.

The first question suggested by the report of this accident, to any one who is at all familiar with mining matters, is: Was not the cage provided with safeties? The answer comes, "Yes, but the safeties refused to act." What was the condition of the hoisting hand? Had it lately been inspected? Yes, the hoisting hand is inspected once a month, and had been pronounced sound but 23 days before the accident. Had the safeties and their connections with the cable been examined? To this query there is no reply. And here it is that a charge of criminal negligence might prove very much to the point. The lives of miners are as good as the lives of any men. They are not to be played with by any spirit of economy on the part of mine owners, and most assuredly not by the carelessness and negligence of mine superintendents.

Luckily, in the case before us, the band broke when the cage had risen less than 100 feet. Only one man was killed, and that perhaps not by the fall. But who shall say that next time the cable will not break when its human freight is almost landed at the top? Will the safeties act better at six feet below the surface than they have at six hundred? There is nothing to assure us that they would, and the imagination shrinks from picturing the results of such a fall.

We have had occasion before to refer at length to the causes of mining accidents. The results of our investigations at that time led to the conclusion that a majority of such accidents grew out of the carelessness of the miners themselves. Since then we have studied the subject further, having collected accounts of a large number of accidents. We are not able at present to state definite conclusions from them. We shall soon be ready to give the results. Suffice it to say now, that whatever may be the carelessness of the common miner, altogether too many accidents may be laid to superiors. Deaths caused by accidents of this latter kind have been reported thick and fast lately. This Guadalupe accident capped the climax, and, without waiting to arrange statistics and calculate percentages, we exclaim now against that seemingly petty carelessness, that insufficient carefulness, which is so reprehensible as being so likely to be fatal when practiced by the manager of a mine.

Mines and Works of Almaden.—No. 14.

[Translated for the PRESS from "ANNALES DES MINES."]

The workmen labor partly by wages and partly by contract. The manufacture of the aludels, the repairs of the furnaces, the extraction of the cinders are undertaken by contract. The charging and discharging of the furnaces, the roasting of the ore, the luting of the aludels and of the doors, the extraction of the soot are, on the contrary, paid by the day.

The cost of the manual labor may be reckoned as follows:

	Days.	Francs.	Francs.
Charging	2 ..	at 2	4
Firing	1 ..	at 2	2
Luting	½ ..	at 2	1
Discharging and cleaning	2 ..	at 2	4
Total			11

To this it is necessary to add the manual labor for the treatment of the residues. This last operation, the *batido de cabezas* produces for two furnaces per year from 350 to 450 kilograms of mercury; on an average for each operation it gives 3.16 kilograms for each furnace.

The total expense of a single operation may be estimated as follows:

	Francs.
Manual labor paid by wages	15
" " " contract	5
Fuel	25
Maintenance and repairs	5
Total	50

Or, per ton of ore worked about 4.50 francs, and per ton of mercury produced 60 francs, of special expenses for the Bustamente furnace.

First. *Idria Furnace.*—The following are the precise results of four operations, in which an exact account is taken of all the products and all the expenses:

	1st Operation.	2d Op'n.	3d Op'n.	4th Op'n.
Charge (tons)	28.5	28.5	28.5	28.5
Hours of fire	10	11	11	11
Wood consumed (tons)	3.385	4.29	4.03	4.68
Duration of the operation (days)	6	6	6	6
Mercury produced (kilog.)	1001.55	1538,75	1837.98	1738.13
Slag { Well burned (kilog.)	25,373.	25,329	24,915.	26,114
Slag { To be retreated (")	25	521	35	24

In resume:

Ore treated (tons)	114	
Mercury produced, before the *batir cabezas* (kil.)	6,716.355	
Fuel burned (tons)	16.385	
Slag produced (tons)	102.336	

These four operations cannot be taken as types, the charges were made, in fact, without bricks of menn, and were composed only as follows:

Metal	4.6 tons,	or	16.14%
China	17.0 "	"	57.16%
Solera	6.9 "	"	24.21%
Total	28.5 "		100%

The slag represents 87.768% of the charge; the difference, 10.232%, represents therefore the total amount of all the volatile substances (mercury, sulphur, water, bituminous matter, etc.)

The soot from these four operations was washed with care, and furnished 1,791.725 kilograms of mercury, which gives as a direct product of the four operations 8,508.08 kilograms of mercury, or an average of 2,127 kilograms for each.

These figures are somewhat low, from the absence of the rich menn from the composition of the charge, the mean of 66 operations made in the winter of 1875-6 gave for each operation 2,508.928 kilograms of the metal.

The residues of the powders washed in the four operations already cited weighed 1,993.34 kilograms, of which,

	Kilograms.
Residues from the 1st chambers weighed	970.4
" " 2d " "	325.3
" " 3d " "	311.0
" " 4th " "	94.8
" " 5th " "	95.02
" " 6th " "	91.92
" " Flues	104.00
Total	1,993.34

The residues washed held about 10% of water; when dry they weighed, therefore, 1,794 kilograms. The following is their contents in mercury:

Resi'e from the	Analysis at School of Mines at Madrid.	Analysis at Laboratory at Almaden.
1st Chambers	44.20%	43.80%
2d "	21.70	21.50
3d "	14.42	13.90
4th "	12.16	11.96
5th "	15.07	14.90
6th "	13.50	13.02
Flues	12.16	12.19

From this it follows that 1,993.34 kilograms of residue contains still:

	Kilograms.
Residue from 1st Chamber	380.026
" 2d "	63.531
" 3d "	40.362
" 4th "	10.375
" 5th "	13.009
" 6th "	11.168
" Flues	11.409
Total	535.880

Kilograms of mercury, if we take, as nearer the truth, the assay as showing the greatest amount of mercury.

Hence, then, the total product of the four operations was:

	Kilograms.
1. Mercury received in the reservoir	6,716,355
2. Mercury taken from the soots	1,791.725
3. Mercury still contained in the washed soot	535.880
Total	9,043.960

This came from 114,000 kilograms of ore.

That is to say:

Classes.	Amounts. Kilog.	Contents Per Cent.	Mercury contained, Kilog.
Metal and China 1st	21,080	25.00	5,270.000
China 2d	9,840	17.96	1,078.704
China 3d	8,920	14.66	1,307.672
China 4th	3,160	8.88	280 608
China 5th	4.480	4.99	223.552
China 6th	5,400	2.46	132.840
China 7th	33,520	1,05	351.900
Solera	27,600	0.89	220,800
	114.000	8.30 (average)	9,466.130

But of the 9,043.96 kilog. of mercury produced, 535.88 kilog. is still mixed with impurities. If we admit that the ulterior treatment of these residues does not give more than 80% of the mercury which they contain, they would not give more than 428.704 kilog. The total product of four operations can then be estimated as

	Kilog.
1—Mercury in the reservoir	6,716.355
2—Mercury from the soots	1,791.725
3—Mercury extracted from residue	428.704
Total in kilograms	8,936.784

Or 7.84% of the ore treated in place of 8.30% which the assays give as an average content of the different classes of ores—

	Kilog.
Therefore the mercury contained is	9,466.130
The mercury obtained is	8,036.784
Loss in kilog	529.352

The loss is only 0.464% of the ore treated, or 5.59% of the contents of the ore.

Let us see now what have been the expenses for manual labor, and material for these operations:

Manual Labor.	Per Operation.
Charging, 5 days @ 2.00 francs	10.00 francs.
Maintenance of fire 1 day @ 2.00 francs	2.00 "
Luting, 1 day @ 1.25 francs	1.25 "
Discharging, 5 days @ 2.00 francs	10.00 "
Removal of ashes, 1 day @ 1.00 franc	1.00 "
Examination of slag, 4 days @ 0.50 francs	2.00 "
Cleaning of chambers, 6 days @ 0.50 francs	3.00 "
Weighing of slag, 4 days @ 0.50 francs	2.00 "
	31.25 francs.
Or for operations	125.00 francs.
Cleaning of chambers { 3 days @ 1,000 francs / 6 " " 0.830 " / 3 " " 0.625 }	9.375 francs.
Extraction of slag, at 7.25 francs per operation	29.00 "
Extraction of soot, 40 days or fractions of	29.25 "
Washing of soot 23 " " " "	13.25 "
Weighing of ore	58,95 "
	264,82 francs.
Fuel, at rate of 27.50 francs per operation	119.00 francs.
	374 82
Or, per operation, 93.45	francs

These figures are even smaller in the example chosen than is ordinarily the case. They ordinarily do not weigh either the ore or the slag. They save therefore the sum of 60 francs. On the other hand, certain prices have changed; fuel costs now 42.50 francs per operation in place of 27.50 francs.

The cost of repairing the furnaces is very small; they were in the first place very solidly built in the beginning in 1806, and do not require hut small repairs. It is a high estimate to put them at 30 francs per furnace for each operation. We can then reckon to-day upon the following expenses:

Manual labor	51.00 fr.
Fuel	42.50 "
Repairs	39.00 "
Per operation	123.50 "

Or per ton of ore treated: $\frac{123.50}{28.500} = 4.33$ fr.

The cost of treatment is therefore nearly the same as in the Bustamente.

We will have to return later to the essential element which must be improved, the loss of mercury. We will now endeavor to ascertain the entire cost of producing a ton of mercury at the works of Almaden, omitting from the account at first the general expenses and the value of the ore. The following table of the expenses of the works in the year 1873-74 will permit us to arrive at an estimate sufficiently approximate:

(*a.*) Manual Labor.		Sum in francs
Charging and discharging	12,026.00	
Extraction of slag	7,478.16	
Repairing furnace	3,573.79	25,521.95
Luting of doors and joints	3,444.00	
Superintendence	12,054.26	
Workmen	47,204.20	
Masons	516.00	
Work at warehouse	6,243.13	
Care of tools	904.50	78,644.93
Watchmen	912.50	
Factory	8,923.00	
Discharge of carts	2,696.20	
Washing	31.50	
Carpenters	109.12	
Francs		105,266.88
Construction of 2 pairs of Bustamente furnaces		18,730.56
(*b.*) Material.		francs.
Sand, clay, etc		9,800.00
Aludels		4,618.71
Fuel		29,102.95
Lime		25,453.50
Portland cement		127.25
Coal		1,220.22
Ashes		159.75
Sparte		2,578.42
Balais		66.00
Iron bottles (frascos)		00,000.00
Iron for tools		203.20
Brick tiles		20,402.83
Sundries		259.20
Total		154,308.12

The production during 1873-74 was 676.104 tons, and the total expenses during the year, including the cost of building two new furnaces, was 278,205.55 francs, or per ton of mercury about 285 francs.

[To be Continued.]

A TERRIBLE famine prevails at Magador, Morocco, the deaths numbering 25 daily.

What and How?

In this column are printed all sensible inquiries relating to and connected with mining or relating to any matters of general scientific interest, also the answers to them as dictated by individual experience, or as furnished by correspondents.

Conquering Refractory Ores.

EDITORS PRESS:—In your issue of the 7th inst., remarking on the President's message, you speak of "those refractory ores which, all over the mining part of the country, still continue to defy the metallurgist." Will you be so kind as to inform me where those ores are, as I presume you speak of gold, silver, or copper ores, these being the principal objects of search in this country. I should like to experiment on such refractory ores; for though I have once or twice failed to work companies or superintendents successfully, I can truly say I have yet to meet with a silver ore which could not be worked by one or other of the known processes to 80% or upwards. However I exclude smelting as a branch in which I have no experience, confining myself to amalgamation or lixiviation, with their various modifications. I also exclude gold sands and gravels, which are too poor to admit of anything more than washing; but these exceptions apply to myself only, there are others whose experience has been greater, and who will doubtless join me in asking, where are these refractory ores? C. H. A.

Benton, Mono Co., Cal., Dec. 11th.

There is probably no ore of gold or silver, or both, that cannot be worked, at least on a small scale. Some very refractory ores can be worked on a larger scale and with profit, but, at the same time, with such waste of the precious metals that the process is deemed very unsatisfactory. The ores of Meadow Lake, Nevada county, for instance, have for more than 10 years verily "defied the metallurgist." They have been worked, to be sure, but with what pecuniary success may be judged from the deserted village in the Sierras. Lately it has been said that Willard's furnace could manage the ore, but this is not yet definitely established. Ores on some of the ledges of Shasta county are said to be similar to the Meadow Lake ore. Here again, a process has lately been successful, viz., the O'Harra furnace process. Further east in Nevada there are numerous places where the ore is very difficult to work. At one mine in Ward district, several bad failures have been made, stockholders being taxed to put up one style of works only to be called upon again and again to put up still other works to be operated on different principles. And after all these changes from amalgamation to lixiviation, and from lixiviation back to amalgamation, it is still open to some question whether the ore may be classed as economical, although several hars of low fineness have lately been shipped. It is said that the ores of Robinson district are refractory. Lately, however, copper bars have been forwarded from this district, but how economical the process is we are not prepared to say. We believe that the telluride ores of Colorado, Montana, and Idaho have presented difficulties, to some extent overcome by this time.

As we stated in the remarks referred to by our correspondent, a proposition was brought before Congress some years ago, providing for a fund to be applied in promoting the development of the mining industry, by encouraging inventors in the line of processes for working difficult ores. We do not think the proposition advanced far enough to be drawn up into a bill. And it is our opinion that the mining industry needs no aid of this kind. But, as we said before, we do believe that a great deal of good may come from a discussion just such as our correspondent has commenced. We hope he will be answered by others of wide experience, who are better able to inform him than we. We have tried to start a discussion on the relative merits of amalgamation and lixiviation with certain classes of ores. Mr. W. T. Rickard, of Arizona, has taken interest in it, and in this issue we are glad to call attention to a second article on the subject by Mr. Ottokar Hoffman, of this city. We hope to hear from others on both of these subjects.

AN explosion of nitro-glycerine and gunpowder occurred at St. Bernard coal mines at Earlington, Ky., December 13th. The shock was felt for miles. A train of mining cars, mules and a negro driver were blown to atoms.

THERE is being manufactured at Chicago a 100-stamp quartz mill for Arizona. What part of the Territory this mammoth mill goes to is not known, but it is presumed it goes to southern Arizona.

ISRAEL R. BLUMENBERG sues the North Con. Virginia Mining Co., in the Twelfth District Court, to compel the transfer of 833 shares of the capital stock to him.

ABRAMS & CARROLL have commenced suit in the Twenty-third District Court to recover $1,412 from the Minnietta Belle Silver mining company, for goods sold and delivered.

THE First National Bank and Commercia Bank, of Saratoga, N. Y., have closed their doors.

The Bird of America.

The White-headed, but incorrectly called Bald Eagle, is well known to every one as the emblem of the United States. Many, however have false ideas of its real appearance and habits, obtained chiefly from unnatural figures and fictitious stories, so we have reproduced here the excellent illustration from life made for the "Ornithology of California," published by the Legislature in 1870, giving also a short account of its natural history from the most authentic sources.

The colors of old birds of both sexes are dark chocolate, or blackish brown, the feathers paler at edges, the head and tail pure white, bill and feet yellow. Length, 30 to 43 inches; extent of wings, 78 to 88 inches; wing, 20 to 26 inches; tail, 11 to 15½ inches; the female being considerably the largest (as in all birds of prey), and Pacific coast birds are larger than eastern or southern. The young in the first year is nearly uniform black, the feathers afterward growing out paler, and white near their base, every year becoming more white on head and tail, until the fourth year when these parts become entirely white. This change with age has led many to suppose that there were several kinds, especially as young birds often show white patches on the body.

THE WHITE HEADED OR AMERICAN EAGLE.

Such a showy and noble-looking bird of course attracted the attention of the first European visitors to America, north of Mexico, where it is not known to exist. Its white head distinguished it from the very similar white-tailed eagle of Europe and Greenland, leading the celebrated Linnæus to adopt for its scientific name the Greek word for White-headed, which, combined with the generic title of the Fishing Eagles, makes that used by naturalists in all enlightened countries since 1760, namely, *Haliætus leucocephalus*.

About 1776 Congress adopted it as the emblem for our coins, and other national devices, against the advice of that practical philosopher, Franklin, who thought that a bird which lived in great part by robbing the industrious fish-hawk and killing defenceless lambs was unworthy of such an honor, advising that the honest and useful turkey should be adopted in its place, being also an American bird. This would have been, perhaps, as appropriate as the barnyard fowl of France, but the admirers of the Roman emblem, and the dignified aspect of the eagle, prevailed—though it has been recently supposed that the bird on coins may represent something quite different, almost anything between vulture and owl in fact, perhaps varying with the baseness or intrinsic value of the metal.

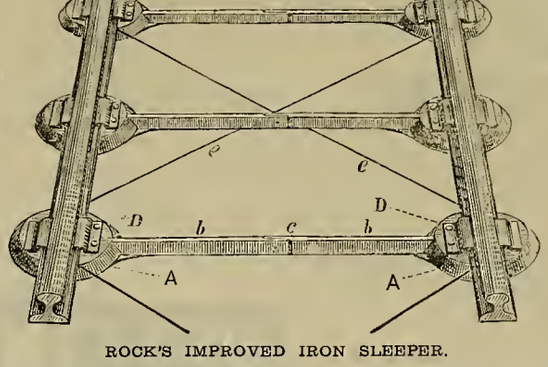
This bird inhabits the whole of North America, except Mexico and southward, where other kinds occur. It leaves only the extreme northern shores in winter, remaining wherever it can obtain fish from unfrozen waters, or small animals and birds near the forests. It is, however, a lazy bird, never diving for fish or pursuing game when it can find them dead or disabled, and therefore watching the fish-hawk and the hunters to share what it can capture with their aid. Its flight is heavy and slow compared with some birds of prey, which to some extent excuses it for "sponging" on others; but it has been seen at times to fly with great swiftness, capturing the flying fish in its short course over the waves, and certainly is swifter than the laborious fish-hawk. At times it is forced to dive for fish, circling round high in the air until it sees one near the surface, and then plunging like a bullet headlong to the water, though it does not go beneath it, but seizes the fish in its long, sharp claws. It also picks up dead ones and injured birds in the same way, while at times it varies its fare by hunting ground squirrels, etc., watching for them from the air or a tree.

The California Indians, and, to some degree, the Spanish population, held this bird sacred, and formerly it was a numerous species, allowed to live around the ranchos as a useful tenant, on account of killing many squirrels, though it might occasionally capture a weak lamb or pig. Instances have been published of infants being carried off by this eagle, but less often than by the fiercer and stronger golden eagle. Nowadays, as every schoolboy is allowed to carry a gun and shoot what he can, there is no danger of eagles becoming too plenty. Indeed, they are fast decreasing in numbers and will soon be rare in California.

The nests of this eagle were formerly very common here, built often in some tall sycamore and large enough to fill a two-horse wagon, being composed of large sticks, three or four feet long, piled together year after year, until the mass was five feet thick, having a little cavity at the top lined with a few clods of turf, moss, etc. In this are laid two to four eggs nearly equally rounded at both ends, whitish, rough, and from two and one-half to three inches long. They are laid from January to April, according to climate, the bird nesting from latitude 32° to latitude 68°.

Near the sea coast, where trees are absent, the nest is often built on a cliff, but pine trees are the usual kind selected northward.

The title of fishing eagles, given to this (and eight or nine other foreign kinds), merely shows its favorite food, and, indeed, it is rarely met with many miles from water, usually building its nest near its fishing resorts. In captivity it is dull and silent, except when hungry, then screaming and ruffling its feathers at sight of food in the most fierce manner. Young birds have often been raised from the nest, but are always dangerous pets, requiring a cage or chain, though they were formerly kept half-tamed about the ranches, going off to hunt in the morning and returning at night.



ROCK'S IMPROVED IRON SLEEPER.

Iron Sleeper for Railroads.

Alexander D. Rock, of Eureka, Nevada, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency a peculiar arrangement of iron sleepers, shown in the accompanying engraving. *A*, *A*, are two inverted bowl-shaped cast-iron bed-pieces, upon which the rails of the railroad are secured by means of the ordinary chairs. Each of these bearings has a cast-iron arm or bar, *b*, long enough to extend half way across the track, and the meeting extremities of the arms of the two opposite bowls are united in the middle of the track by a lap or other equivalent joint, as shown at *C*. The upper surface of the inverted bowl-shaped bearings are made flat, so that the chair, *D*, can be readily secured to it by bolts. Beneath the rails in each chair may be placed a thin sheet of india rubber or other yielding material, in order to lessen the vibration between the rail and bearing. The adjoining ties are bound together by diagonal iron rods, *e*, *e*, so as to join the bearings, and thus give the bed a perfect connection throughout.

The inverted bowl for a base will keep the bed steady and firm on loose, sandy or soft soil, owing to the extended surface which the bowl covers. The bowl can be easily raised or lowered and adjusted at pleasure by tamping or removing the earth from under it in the usual way.

The center-coupling provides a chance for the road to yield under sudden pressure, and the elastic substance under the rail prevents rigidity and does away with much wear and tear on the rolling stock.

The bracing of the ties by transverse rods keeps the bed in place where it is either straight or curved.

Asbestos in San Diego County.

Mr. C. S. Colby, of Banning, San Bernardino county, has shown us some specimens of asbestos, from his claim near Agua Caliente, San Diego county. The asbestos occurs in a number of veins, only one of which, however, has, on account of its size, been worked to any great extent.

This vein is about 12 feet wide where first cut, running in a north and south direction. South of the first cut, 300 feet, the ledge was found to be 30 feet wide. Again, 2,000 feet south, the ledge has been struck, but its width at that point has not yet been determined.

The walls of the vein are smooth hard cement. The fibers of the asbestos extend directly across from wall to wall, and are nearly horizontal. The material appears to be of very fine quality. Mr. Colby has worked the ledge to a depth of 10 feet, and an aggregate horizontal distance of about 2,000 feet. The walls go down vertically, and gives no signs of petering. Pieces weighing 200 pounds have been taken out, and Mr. Colby says that he can get them of any manageable size. In the neighborhood there is a very peculiar pipe vein of asbestos. This vein is nearly perfectly round, and is about as great in diameter as the crown of an ordinary hat. Its length has not been determined. One of its peculiar features is that the asbestos contained in it, is in a fine pulverulent form. Large deposits of such material would undoubtedly be very valuable, much more so for some purposes than the fibrous variety. Mr. Colby finds good market for his asbestos. He has promised to send a box of fine selected specimens to the University. We hope he will keep the promise, as we believe asbestos has not been before discovered in large quantities so far south in the State as San Diego.

PACIFIC COAST POSTAL CHANGES.—The following are reported for the week ending December 14th: Offices discontinued — Workman, Los Angeles county, California. Postmasters Appointed—Gilbert Lampbere, Berryville, Siskiyou county; Hiram Shartzer, Highland Springs, Lake county; W. M. Tucker, Leesville, Colusa county; Silas R. Lewis, Orland, Colusa county; Abbott Richardson, Sheep Ranch, Calaveras county, California; Livingstone Vance, Wildervillc, Josephine county, Oregon; Miss Maggie Patterson, Safford, Pima county, Arizona.

FOSSILS IN RINCON HILL.—A few months ago Dr. J. J. Bleasdale, while walking through Second-street cut, picked up a chance piece of the blue shale, of which there is so much in the excavation. On splitting it apart, or rather lifting off a portion of it, he found a knot of about fifty fossil worms. The formation in which he found them is tertiary. This is very interesting, as few fossils have been collected on the upper end of the peninsula, so few that the geologists were some time in becoming thoroughly convinced of the age of some of the neighboring hills.

IT is said that Senator Jones proposes to spend several thousand dollars in sinking an artesian well for the benefit of the Santa Monicans.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME St., N.E.Cor. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken ont Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Mechanical Draftsman and Engineer
No. 214 Sansome Street, (Room 29,) S. F.
Working Drawings Furnished. ☞ Premium obtained for Designs furnished the city for proposed Steam Fire Launch.

South Pacific Coast Railroad.
New Route (Narrow-Gauge.)

Commencing Monday, September 30th, 1873, boats and trains will leave San Francisco daily from the New Ferry Landing, foot of Market street, at 5:30 A. M., 9:00 A. M., and 4:00 P. M. for ALAMEDA, SAN JOSE, LOS GATOS, ALMA, and all way stations.
Stages connect with 9:00 A. M. train at Alma for Santa Cruz.
EXCURSION TICKETS will be sold Saturday afternoons and Sunday mornings from San Francisco and Alameda to San Jose, Los Gatos, and Congress Springs, and return, at reduced rates, good only until Monday evening following date of purchase.

FERRIES AND LOCAL TRAINS, DAILY.

From San Francisco.—5:30, 16:40, 9:00, 10:30 A. M.; 1:30, 4:00, 5:15, 6:30 P. M.
From High Street, Alameda.—15:40, 7:40, 9:01 A. M.; 12 M.; 2:40, 4:00, 5:16, 6:24 P. M.
†Daily, Sunday excepted.
The Company are prepared to carry vehicles of all kinds on the Ferry, to and from San Francisco, Alameda and Oakland.
THOS. CARTER, Superintendent. GEO. H. WAGGONER, Gen'l Passenger Agent

CAUTION
To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,
North Bloomfield, Nevada Co., Cal., October 1st, 1878.

THE IMPROVED O'HARRA
CHLORIDIZING FURNACE.
Patented Sept. 10th, 1878.

Now in Operation at the Extra Mining Co.'s Works, Copper City, Shasta Co., Cal.

Two men and two cords of wood roast
Forty Tons of Ore in Twenty-four Hours,
Giving a full chlorination (100%) at a cost of 30 cents per ton. Address,
O'HARRA & FERGUSON,
Copper City, California.
Or CHAS. W. CRANE, Agent,
Room 10, Safe Deposit Building, San Francisco.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

FRED. M. PATRICK, Manager.

ARITHMETIC MADE EASY
BY ROPP'S
Easy Calculator.

This valuable work is used by thousands of farmers, mechanics and business men, and is highly recommended for its practical utility and convenience.

It embodies an entirely new system of calculation, by which a vast amount of figures and mental labor—required by the ordinary methods—and fractions with their complexities, are absolutely avoided.

It is so simple and easily comprehended that even the most illiterate is enabled, in a few minutes, to reckon with absolute accuracy and speed; while its original and rapid methods, benefit and delight the most scholarly.

It shows at a glance the accurate value of wheat, corn, rye, oats, barley, cattle, hogs, hay, coal, lumber and merchandise, from one pound to a car load, and for any price the market is likely to reach.

It gives the interest, simple and compound, on any sum, or any time, at six, seven, eight, and ten per cent.; the exact measurement of boards, scantlings, timbers, saw logs, cisterns, tanks, wells, granaries, bins, wagon beds, corn cribs, etc., the wages at various rates, for hours, days, weeks and months; besides numerous other important methods, rules and tables.

It is printed on fine tinted paper, is well and elegantly found in pocket-book shape, and accompanied by a silicate slate, pocket for papers, and memorandum, which can be replenished in the two latter styles.

It answers the purpose of a pocket book and diary, and costs no more, although it was gotten up at great expense and labor, and is unquestionably one of the most useful publications ever issued from the press.

Price, bound in Fine English Cloth, $1.00.
Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted by express. Address
DEWEY & CO., San Francisco.

Gould & Curry M. Co.,	

REYNOLDS, RIX & CO., Agents.
18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

The Only SAFE BOILER.

SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,

Elephant Ore Stamp.

We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12 Stamp Battery of the present system, having crushed as high as 14 tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The 'Elephant' having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12 Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thoroughbrace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12 Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Boise. As no part of the Machine weighs more than 1,800 pounds, the handling of the Machine is comparatively easy, and in places where it would be necessary to pack the Machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order. The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main street, near Harrison, San Francisco. For particulars apply to

EDMUND WHITE, Care of A. B. Grogan, 705 Sansome Street, San Francisco.

ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

In daily use at the Palace Hotel and the Union Iron Works, S. F.

For Lighting Mines, Factories, Mills, Streets, Theaters, Public Halls, Etc., It has no Equal, either for Brilliancy or Cheapness.

SAN LORENZO, December 6th, 1877.

MESSRS. DEWEY & CO.—*Gentlemen:* I received the Letters Patent for my invention on the 5th inst., and beg to thank you for the gentlemanly and business-like manner in which you have dealt with me from the beginning of my application. I shall always feel it a pleasure to recommend you to all I come in contact with who need Letters Patent. Respectfully, WM. DALE.

Continued from page 389.

been discontinued for the present. Everything running smoothly and well.

WARD.—Work on the foundations for the new machinery is progressing favorably. The east drift on the 800 level shows little or no change.

SILVER HILL.—As soon as the pumps are all in good running order down to that depth, crosscutting the 1100 level will be commenced. The St. Lonis drift is making good progress.

HALE & NORCROSS.—The joint east drift on the 2000 level is making much better speed, having passed through the belt of hard rock recently strnck into much softer and more favorable ground.

SUTRO TUNNEL.—Total length of south lateral drift toward the Julia shaft from the main tunnel, 936 feet.

YELLOW JACKET.—The south lateral drift on the 2400 level is in a favorable looking formation of clay, quartz and porphyry, showing constant improvement as the drift advances.

SOLID SILVER.—The outskirts of the vein are evidently being passed through, and the drift will soon be into the maiu west ledge itself.

LEVIATHAN.—The main lateral drift north, on the 750 level, is steadily advancing and the increasing amount of quartz stringers met with, indicate nearer proximity to the ore chimney found on the level above.

CROWN POINT.—Sinking the donble incline winze below the 2300 level is making good headway. The east driit from the 2300 station still continues in a favorable character of vein matter. The north crosscnt on the same level is steadily advancing, the face also iu eucouraging veiu formation.

UNION CON.—Sinking the joint Mexican winze below the 1600 level is making good headway, the bottom being in a much softer character of porphyry, carrying occasionally streaks of quartz of a very favorable character.

NORTH BONANZA AND FLOWERY.—The 200 station, 130 feet below the old tunnel level, has been opened and a drift started northward along the east clay wall of the ore vein. The main incline will be pushed on downward to reach and open up another level at the earliest day possible. Sinking the north winze, below the tunnel level on the east clay wall of the ore vein, also makes the best of progress.

GOULD & CURRY.—The joint Best & Belcher crosscut, on the 1700 level, is making steady headway. The east crossents, ou the 1900 level, are also making the best of progress, without any changes of value to report at any point.

CALEDONIA.—The north crosscut on the 1600 level is in a favorable character of quartz aud porphyry mixed. The east drift on the 1600 level is also making good progress, the faco in very hard blasting rock.

JUSTICE.—The mill is kept steadily running on ore from the mine, crushing at the ratc of 600 tons per month.

ALTA.—Driving the main north drift outside of the ore vein on the 1550 level is making the best of headway, the face in good working ground. The north drift on the 1450 level is also making good progress.

SUCCOR.—Sinking the main shaft is going steadily aud energetically ahead, the bottom in good blasting rock.

ALPHA.—Siuking the joint Imperial winze below the 2400 level is making steady headway, the bottom in porphyry streaked with quartz. It is now down 164 feet on the slope.

ATLANTIC CON.—Crossentting from the hottom of the shaft, toward and into the two ledges, progresses well, and the prospects are excellent for pay ore.

OVERMAN.—The nortb lateral drift on the 1600 level is steadily advancing along the ore vein, the face in a very favorable mixture of quartz and porphyry. The east drift on this level is advancing in a very lively, healthy quartz formation. A south crosscut has been started, the face of which shows a lively, favorable ledge formation.

CON. VIRGINIA. — A small amount of ore is being extracted from the old ore stopes on the 1400 and 1500 levels. An upraise is heing made to connect the 1400 and 1500 level, which will greatly assist the ventilation and the extraction of ore on the 1400 level. The main south drift on the 1950 level is making steady progress, the face still in a fine vein formation. It is likely that dnring the eomiug month the extraction of ore from the lower levels will be gradnally iucreased as the weather grows cooler, and the repairs to the air connections are completed.

SIERRA NEVADA.—Sinking the south winze below the 2200 station is going vigorously forward, the hottom of the winze still in ore of fine character. The formation has the same regularity and all the favorable indications that has characterized it for the last 100 feet or more.

SAVAGE.—There is no change in the condition of the water in the main incline. The joint east drift on the 2000 level has passed through the belt of hard rock encountered last week, and the face is again to-day in very soft, favorable rock. The south drift ou the 2100 level from the hottom of the north winze is iu 87 feet, the face in very soft, favorahle porphyry showing streaks of good quartz. The east crosscut on the same level is in 191 feet, the face in soft ground full of clay slips and small veins of quartz.

COLORADO.

SILVER CLIFF.—Pueblo *Chieftain:* A new and important discovery has been made near Silver Cliff in a "chimney" on the Chieftain lode. The lodes radiate from it like the spokes in a wagon hnh, and the shaft is now eight feet deep and it shows better as depth is gained. An assay made at a depth of four feet shows 16 onnces in gold and only a trace of silver. The intersecting lodes are true fissure quartz veins. The excitement is at fever heat, but none but the original discoverers and a few of their friends have been let into the secret. People are prospecting in every directiou but the right one. All the old prospectors from other districts pass the lodes over, thinking them worthless. The whole country is seamed with lodes bearing gold and silver. An assay from the surface rock on the Annie lode showed over 60 onnces of silver. The Copper Hill or Eastman district is on Grape creek about seven miles northeast of Silver Cliff and not more than a mile from the Canyon City stage road, and is very easy of access. Timber of the best quality is plenty in the vicinity, and it is much warmer than at the Cliff or Rosita, being sheltered by the high mountains ou the north. The mines are on the south side of the creek near what is known as Steele's ranch. The indicatious show that there are more craters or chimneys in the vicinity.

OREGON.

MONUMENTAL.—*Idaho Avalanche*, Dec. 7: A receut letter from Independence, Grant county, Oregon, says: "Mr. Stemme, of Portland, President of the Monumental Silver mining company, passed through here recently. He expresses himself as highly pleased with the appearance of the Monumental. During Mr. Stemme's stay the hands were paid off and contracts were let for further work in the mine. The mill, which it was supposed would be erected this fall, will not he put up until spring. The upraise on the ledge is 250 feet high, and running on a large body of good ore, of which there is sufficient on the dump to pay expenses. Some of the larger veins run parallel with the Monumental. They have been encountered to the nnmher of 12, the Monumental proper making 13. The tunnel which was run to tap the main ledge cut the parallel veins mentioned. Among the latter, designated as No. 12, I believe, is the Doyle ledge, carrying gold in paying quantities. The ore from this ledge resembles that fonnd in Gold mountaiu, Independence district. It is ucarly two feet wide and will help out the finencss of the bullion wonderfully. Mr. Harry McCann, well known at Canyon City, and elsewhere through the mouutains, is officiating in the capacity of foreman. Beagle Brothers' ledge still continues to yield handsomely.

BOULDER COUNTY.—Denver *Tribune:* Some improvemeut is manifest among the mines of Boulder couuty of late, and a better feeliug exists in mining circles than some time ago. Carihou is producing more silver than during the past three years and several good strikes are reported in that locality among re-opened veins. The mines of Ward district, Jamestown and Left Hand, are turning out considerable hullion, and Magnolia shows signs of revival. The same may bc said of Gold Hill where the Slide has been paying largely, and Horsfal, Cold Spring and other lately re-opened mines are showing well. The Smnggler at Balarat, and the Melvina near Salina, continue to turn out largely. Several mills and smelters have all they cau do, and altogether the outlook is decidedly promising in most of the districts of this county.

IDAHO.

BLACK JACK.—*Avalanche*, Dec. 7: Work still goes a head at a lively rate and the usual shipments of rich rock are being made to the mill. A quartz house, and other improvements designed to facilitate winter operations have recently been eompleted. Thc adit tnuuel is in nearly 400 feet, running through good ore, and everything wearing a promising appearance.

POTOSI.—New hoisting works are progressing rapidly. The shaft is heing put in good condition, and in a few days there will be plenty of rich ore going away from the mine.

BELLE PECK.—A force of men has recently started up, and Mr. Peck is sanguine that the most favorable results will follow. The Eastern capitalists who bonded that mine a few months ago made a tremendous mistake in abandoning it, and they will discover that to their sorrow before long. We predict, upon the very best practical opinions, that the Belle Peck will yield over $100,000 during the coming six months.

OTHER MINES.—Mr. Vanwie and others are working a miue called the Niagara, near the Empire. They are down 26 feet and the prospects are quite encouraging. Other mines near the Poormau are yielding handsomely.

THE bill for the payment of invalid and other pensions for the next fiscal year, as it passed the House, appropriates $29,366,000, being $250,000 less than the amount estimated, aud $5,500 less than the appropriation for the present fiscal year.

A LIVERPOOL firm is reported to have purchased a steamer for the purpose of importing live pigs from America. The vessel is being fitted up to hold over 2,000 pigs, as well as cattle.

THE first shipment of horses from Amcrica for the nse of the French army arrived during the past week at Havre, and were ordered through Consul Bridgland. The French Military Inspector is much pleased with them.

WE call attention to the advertisement of McDonald & Johnson's Stylograph or Rapid Letter Copying Book.

Bullion Shipments.

Since our last issue, we have noticed the following shipments of bullion :

California.—Bodie, Dec. 13th, $11,920. Extra, Dec. 6th, $1,161.56; Dec. 10th, $2,062.44. Pittsburg, Dec. 11th, $3,850. Standard, Dec. 16th, $17,617.71.

Idaho.—Black Jack, Dec. 9th, $9,574.13. Potosi, Dec. 9th, $1,732.23. Other sources, Dec. 9th, $1,823.40.

Nevada.—California, Dec. 14th, $194,593.72; total to date, $300,929.70. Christy, Dec. 16th, $5,214. Grand Prize, Dec. 16th, $2,800. Hillside, Dec. 12th, $5,315; Dec. 15th, $5,119. Jefferson, Dec. 11th, $2,073.53; Dec. 13th, $2,073.50. Leopard, Dec. 13th, $5,000; Dec. 14th, $5,000. Manhattan, Dec. 13th, $11,387.87; Dec. 17th, $10,939.58. Navajo, Dec. 16th, $5,200. Northern Belle, Dec. 11th, $5,044.84; Dec. 14th, $2,775.70.

Utah.—The following is from the Salt Lake *Tribune:* The Union Express Company received from the Ontario, Dec. 10th, $3,131.47; Dec. 11th, $5,334.62; Dec. 12th, $2,982.22; Dec. 13th, $2,645.20; Silver Reef, Dec. 12th, $1,669.77; Dec. 13th, $5,176.90; Tiutic, Dec. 10th, $1,000.

No season within memory has been so unfortunate for the Greenland whaling fleet as that just past. The whole Scoteh fleet seeured but six whales, and one steamer was totally lost.

THE fencing of North Carolina is valued at $10,000,000, and the stock at $2,000,000. In other words, it takes $5 worth of fencing to protect the crops againts $1 worth of stoek.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Stroug, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

MODEL MAKER AND MACHINIST.—I. A. Heald, No. 514 Commercial St., San Francisco, (fourth floor.)

And in accordance with law, and an order of the Board of Directors, made on the 31st day of October, 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the Company, Room 20, Safe Deposit Building, No. 328 Montgomery Street, San Francisco, California, on Monday, the thirtieth (30th) day of December, 1878, at the hour of 12 o'clock M. of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale. OTTO METCHKE, Secretary.

Office, Room 20, Safe Deposit Building, No. 328 Montgomery St., San Francisco, California.

Orion Mining Company. — Location of

principal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of December, 1878, an assessment (No. 4) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 28 Sansome street, Sao Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of January, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the 28th day of January, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors. P. CONKLIN, Secretary.

Office, No. 28 Sansome St. (up-stairs) Sao Francisco, Cal.

Summit Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meetiug of the Board of Directors, held on the nineteenth day of November, A. D., 1878, an assessment, (No. 6,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the sixth (6th) day of January, A. D., 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the fourth day of February, A. D., 1879, to pay the delfquent assessmeot, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

The California Fruit Growing Association.

—Locatioo of priocipal place of husioess, San Fraocisco, California. Locatioo of property, El Dorado Conoty, California.

Notice is hereby given, that at a meetiog of the Directors held on the first day of August, 1878, an assessment (No. 9) of three ($3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, Sao Francisco, Cal.

Any stock upon which this assessment shall remaio unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

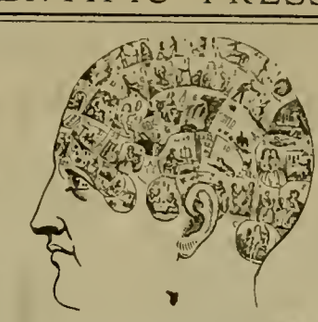
POSTPONEMENT.—At a meetiug of the Board of Directors of the California Fruit Growing Association, held September 23d, 1878, it was resolved that the day of above assessment becoming delinquent be postpooed till Saturday, the 26th day of October, 1878, and the day of sale of delioquent stock is herehy postpooed to Friday, the 22d day of November, 1878. D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, Sao Francisco.

POSTPONEMENT.—At a meeting of the Board of Directors held on the Ninecteoth day of October, 1878, it was resolved that the day of above assessment becoming delinqueot be postponed till November 30th, 1878, aod the day of sale of delinquent stock is hereby postponed to December 21st, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento Street, San Fraocisco, Cal.



Barlow J. Smith. M. D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervo-vital derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impoteocy and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matrou has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even bliudfolded, to determioe the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC NEURALGIC, LEUCORRHEAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical exaoinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

TUBBS & CO.,

611 and 613 Front Street, San Francisco

THE WESTERN SHORE ICE COMPANY.

Office, No. 330 Pine Street, San Francisco, Cal.

This Company having acquired from H. J. West, of London, the sole and exclusive right to manufacture and sell on the Pacific Coast his world renowned ICE-MAKING AND REFRIGERATING MACHINES, are prepared to supply the same to Hotels, Restaurants, Clubs, Breweries, Country Towns and all manufacturers and consumers of Ice on this Coast.

A one-ton Machine will manufacture clear Ice in blocks of any desired thickness, from three inches to four feet and upwards, at a cost of *one-quarter of a cent per pound*. A twenty-ton Machine will manufacture the same description of Ice at a cost of *one-twentieth of a cent per pound*. In cases where power is already on the premises, the cost of manufacture will be less than one-half of the above figures. These Machines have obtained the First Class Prize Medal at the Great Exhibition in London of 1862; the Prize Medal at the Vienna Exhibition of 1873; and are now supplying Ice at the Paris Exposition. Many valuable improvements have been recently made, and they are now acknowledged to be the most complete and economical Ice Making Machine in the world. Apparatus has already been constructed under these patents, which is now in successful operation in Great Britain, India, and New York, equivalent to the manufacture of a *million pounds of Ice daily*.

The accompanying drawing illustrates one of the patent transparent block ice making machines manufactured by the WESTERN SHORE ICE COMPANY. To this apparatus a very plain and simple Steam Engine is attached for working the Air pump. This is made direct acting, by which means the use of all belts or gear wheels is avoided. Where, however, a separate motor exists, the Machine may be had without the Steam Engine, in which case there is of course a consequent proportionate reduction in the cost.

PATENT REFRIGERATING APPARATUS.

BREWERIES. The eminent success which has attended the introduction of this patent apparatus is ample proof of its great superiority over every other known invention of the kind. The most eminent brewers in the world, including Allsop & Sons, Truman, Hanbury, Buxton & Co., and Guinness & Co., have adopted this system, and have eleven of these Machines of the largest kind in use, while 38 of them are employed in various other Breweries in Great Britain.

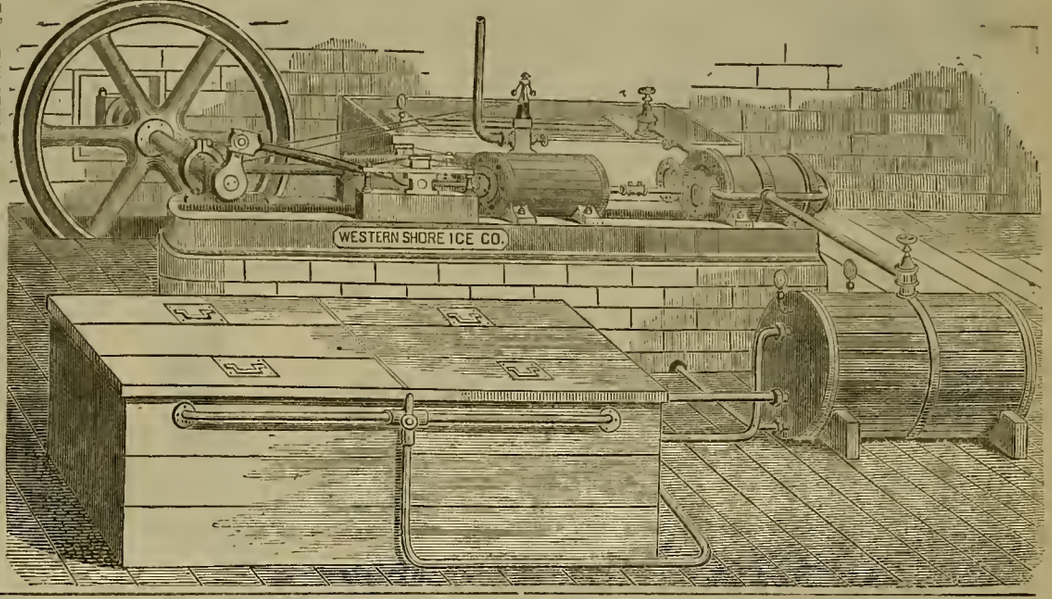
Among the various other purposes for which this new patent machinery is valuable, are the cooling of air or liquids, preserving meat, fish, vegetables, fruits, etc., cooling Hospital Wards, Theatres, Dairies and for all purposes where a low temperature is desired.

The WESTERN SHORE ICE COMPANY are prepared to supply Refrigerating Machines of a capacity for cooling from 50,000 to 500,000 cubic feet of air per hour to 30° Fahr.

For Circulars and particulars as to prices and any other information desired, apply to the Secretary of the

Western Shore Ice Company,
330 Pine St., Rooms 61 & 62, San Francisco.

All Machines Sold will be Accompanied by a Guarantee.



EDISON'S ELECTRIC PEN and PRESS.

Iron and Steel Wire Rope,
Flat and Round, for Mining, Shipping, Hoisting and General Purposes.

Having the most complete and extensive Wire Rope Works in the United States, I am prepared to manufacture Wire Rope and Cables of any length or size at short notice, and guarantee the quality and workmanship equal to any made at home or abroad.

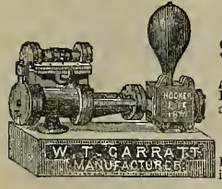
Iron, Steel and Galvanized Wire
Of all sizes on hand or made to order.

Barbed Fence Wire.

Sole Proprietor of
Hallidie's Endless Ropeway,
For the Transportation of Ores, etc.
Send for a Circular.

A. S. HALLIDIE,
Office, No. 6 California St., San Francisco.

W. T. GARRATT'S
BRASS and BELL FOUNDRY
SAN FRANCISCO.
MANUFACTURER AND IMPORTER OF
Church and Steamboat BELLS and GONGS
BRASS CASTINGS of all kinds,
WATER GATES, GAS GATES,
FIRE HYDRANTS,
DOCK HYDRANTS,
GARDEN HYDRANTS
General Assortment of Engineers' Findings.

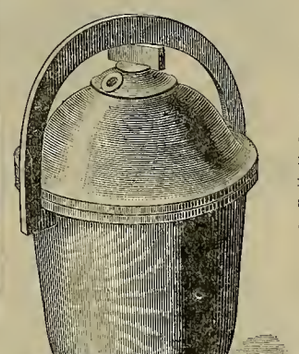


Hooker's Patent
Celebrated
STEAM PUMP
The Best and Most Durable in use. Also, a variety of other
PUMPS
For Mining and Farming Purposes.

ROOT'S BLAST BLOWERS,
For Ventilating Mines and for Smelting Works.
HYDRAULIC PIPES AND NOZZLES,
For Mining Purposes.
Garratt's Improved Journal Metal.
IMPORTER OF
IRON PIPE AND MALLEABLE IRON FITTINGS,
ALL KINDS OF
WORK AND COMPOSITION NAILS,
AT LOWEST RATES.

Dewey & Co. { 202 Sansome St } **Patent Ag'ts**

THE NEVADA OVAL TOP RETORT.

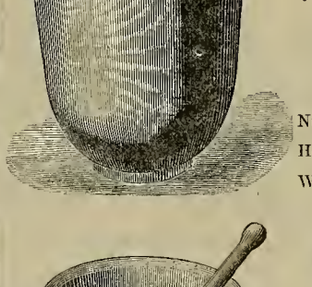


The advantage of this Retort over the OLD FLAT PATTERN is, that it can be filled full of Amalgam, thereby holding more than the old style, besides avoiding all danger of an explosion owing to the crown space in the cover which allows for the expansion. They are made extra heavy, WELL GROUND in the joints, and are furnished with a strong Norway clamp, having a wrought iron key which can be driven in or out of place by a single stroke of a hammer.

The Annoying Thumb-Screws are Entirely Done Away With.

We Make Seven Sizes, as follows:

Number or Pints	1	2	3	4	5	6	10
Holds Pounds Quicksilver	12½	25	38	50	63	75	125
Weight each.....10lbs	15	18	25	31	44	65	



Mortars and Pestles,

GROUND INSIDE.

Size—Quarts	½	1	2	4	6	8	12	16
Hight—Inches	3½	5	6	7½	8½	9	11	1
Weight—Pounds	6½	9	16	22	37	43	72	86

Bullion Ladle.

Forged from one piece of Charcoal Iron, eight inches in diameter by four inches deep.

Send for Circular and Prices.

DUNHAM, CARRIGAN & CO., Agents, San Francisco.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS
Nos. ONE, TWO and THREE.
Stronger, Better and Safer than any other High Explosive.

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO., San Francisco.

GARDNER'S
Celebrated
Governor

These Steam Governors have long been known as THE BEST, and as lately Improved and Perfected, they have no Rival.

THE SAFETY STOP

On these Governors is alone worth double the price of the Governor. We have sold over six hundred, and

Never one has Failed.

They are sold at the same price (or less) as ordinary Governors. Send for Circular.

BERRY & PLACE,
Market, head of Front St., San Francisco.

DEFLECTORS,
Or Perkins vs. Hoskin.

W. H. PERKINS has for nearly two years been threatening orally and through the Press to prosecute all persons using my Patent Deflecting Nozzle, but for *good reasons*, has failed to come to time. I want miners to understand that Deflectors are still manufactured and sold, and that I will defend all suits and assume all responsibility. Mr. P. will confer a favor if he will carry out his threat, as it will afford me the opportunity I desire to again try the case, and he can rest assured that *professional dodges* will not again be allowed to *temporarily* thwart the ends of justice.

I feel confident that the Supreme Court of the United States will ultimately decide in my favor. The superiority of my invention is shown by the means which Mr. P has resorted to in trying to stop my sales. Mr. P. has so degraded himself as to circulate statements which he knows to be *falsc and malicious*. Notwithstanding the great number of my Deflectors in use, I have heard of but one accident, and this was caused by the breaking of the iron lever from a defect in the material and great carelessness in use. This circumstance Mr. P. has magnified into several deaths and numerous accidents. I refer to the following owners and Managers for testimonials as to safety and efficiency. Some of them have used and discarded Mr. Perkins' device in favor of my much superior one. Messrs. Gould, Gold Run, using 4; Spaulding, Dutch Flat, on different mines, 12; Stone, Gold Run, 2; Morgan, Little York, 6 Bisbee, Iowa Hill, 2; Briere & Wheeler, Bath, 2; Mr. Gillvary, Forest Hill, 4; Atkins, Weaverville, 2. I could mention scores of others, but these are sufficient.

Mr. Perkins' device is an infringement on a patent owned by Mr. Craig, who is about to institute legal proceedings to protect his rights. Miners are advised to stand from under. A word to the wise is sufficient. R. HOSKIN,

Manufacturer of Machines for Hydraulic Mining. Address, No. 29 Garden Street, San Francisco, or Empire Foundry, Marysville, Cal.

McDONALD & JOHNSON'S
STYLOGRAPH,
—OR—
Rapid Letter Copying Books,

Making Instantaneous Copying same moment of Writing, without Pen, Ink, Pencil, or Copying Press, each complete, in all sizes,

From 75 Cents to $4.50.

Address, STYLOGRAPH CO.,
12 California St., San Francisco.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia & 59 Gold St., N. Y.

MINING AND SCIENTIFIC PRESS.

SAN FRANCISCO, SATURDAY, DECEMBER 28, 1878.

VOLUME XXXVII Number 26.

Whaling Rocket Trial.

We witnessed in Oakland creek last week, a trial of the Roys & Liliendahl whaling rocket, which took place in presence of a number of persons intereeted in the whale fisheries, among thom Capt. Truman of the *Sea Breeze*, Capt. Halsey of the brig *Siberia*, Capt. Bourne, Capt. Smith, Mr. Thompson, Mr. Brooks, mate of the *Hunter*, and other officers of whaling vessels. The Roye whaling rocket has been known for a number of years, but its introduction and use has not been successful, for the reason that the defects in construction operated against its efficiency. Messre. Fletcher & Suits, owners of patent rights for this coast, experimented with the rocket for some time in order to test it and find out the defecte, knowing the principle was good. They found that it had been previously made too light, and that there was not power enough in it. Moreover, in order to make it cheap, the details of tbe construction had not been carefully worked out. They have improved upon the rocket, made it heavier and stronger, and finally made a practical theory of it. Their succese is evident from the fact that outside of the harbor, during the year, they killed 35 whalee—hump-back, sulphur bottom and fin-back—using the rocket from a emall steam launch.

The apparatue consists of a strong brass cylinder containing the projectile charge. This is loaded with a peculiar powder, made by Fletcher & Suits themselves. In the front of this is secured a bomb containing an explosive charge, and inside of it is a harpoon attached to the shell. An iron is secured to tbe rear end of tbe rocket, to which is attached tbe wbale line. The bomb has a hearded or barbed point, and wheu projected into the whale by the rocket, explodes inflicting a fatal wound. At the same time the harpoon takes its hold, and the boat is fastened to the whale by tbe lino attached to the iron. These shots are good for killiug and fastening to a whale at 30 fatboms distauce, which is, of course, very much further than an ordinary harpoon is available. The whole apparatus weighs 32 pouuds, and from the point of the bomb to rear end of iron ie seven feet five inchee in length.

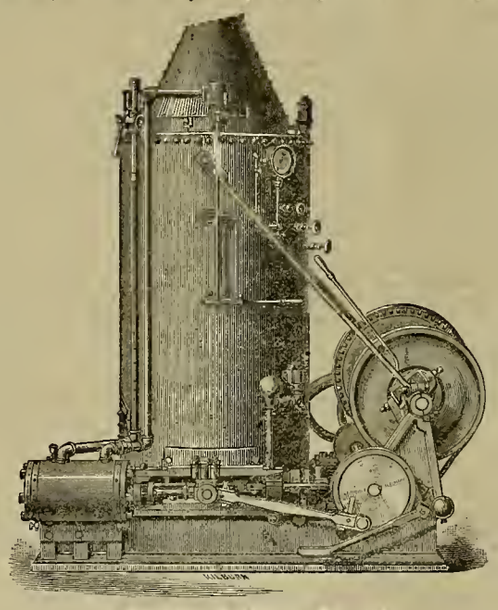
A peculiar reet is used in firing the rocket, having on it a shield to protect the operator from the fire which issues from the rear end of the rocket. The rocket is set in the rest, the rear end of which is placed on the shoulder, and by discharging a pistol charge into a hole provided for the purpose—after aim ie taken— the projectile is discharged and the rocket powder carries the rocket, bomb and line in the direction required.

At the trial the other day, the apparatus was placed on a boat and the spectators were on tbe whaler *Dawn*, now lying in Oakland creek. A tub was allowed to float down the stream and was used ae a target. A young man named Stanley, who is expert in the use of the rocket, fired the first shot at the tub, the projectile striking within a few inches of it. Then Capt. Truman of the *Sea Breeze*, fired a shot, gauging so as to take water short of the tub, in a position which would strike the whale's belly. The shot weut as directed, passing close under tne tub. Capt. Truman sat down, not having braced himself. There is, however, very little recoil, and that is taken by the standard which answers to hold the rest. Capt. Halsey, of the *Siberia*, then fired a shot, which was also inteuded for the whale's belly. It passed immediately under the tub. Those who had not seen the rocket fired before were all surprised at the accuracy with which it went ; even when fired hy those unaccustomed to its use. Any one of the shote would havo killed. All of those present expressed themselves highly pleased with the exhibition. There were several there who had previously used the rocket, but others had not, and it was for the edification of the latter that the trials were made.

Already some six vessels have outfitted with this apparatus for tbe Arctic, each carrying from five to fifty shots. One vessel is to leave shortly, taking with her a steam launch and an outfit of these rockets, hunting the whale with steam and powder instead of oars and muscle. By the use of this peculiar rocket, in the Arctic, where the bowhead are so shy, the whale can be killed anywhere within a distance of 30 fathoms, while on the way it is very difficult to get near enough to them to kill. Very littlc practice will enable any one to shoot tbe rocket very accurately, and wherever it strikes it kills, no whalo getting away wheu struck. Messrs. Fletcher & Suits have acquired the right of manufacture and sale of these rockets for thie market, and will probably fit out nearly the whole whaling fleet this seasou. Capt. Williams, an owner of three whaliug vessels, is so convinced of the efficicucy of the apparatus, that he sayshe wouldn't go on a whaling voyage without it. In fact, its introduction as part of a whaler's outfit is no longer matters of doubt, all those who have used it speaking highly of the apparatus.

A Report on the Minerals at Paris.

When the Pacific Coast mineral specimens were sent on to the Paris exhibition in charge of Mr. H. G. Hanks, they were forwarded and all the expenscs paid by the liberality of a private citizen of Nevada, Mr. John Mackay. The



IMPROVED HOISTING ENGINE.

State did not contribute a cent, and even the expenses of the California State Commissioners were paid by the gentleman mentioned. When Mr. Hanks arrived there he was appointed director of the mineral department of the United States, by the Commissioner General, and had charge of the whole exhibit of this country. The exhibit attracted a great deal of attention from mining men and mining engineers from all over Europe, and although a very full catalogue had been prepared for distribution, there was, and is great demand, for our official report. This report should he on all our minerals, rocks, fossils, etc, exhibited at the exposition, and should be distributed in Europe and America gratis, hy the State. Such a report is expected and has been conditionally promised.

According to Mr. Hanks' plan, which he has explained to us, the report would be a credit to the State and to all interested. There would be two maps, one a map of California, printed in colors, showing the geology as far as known, with the locality of our gold, silver, lead, copper, quicksilver, etc. The second map would be an outline and showing the position of California as a commercial center. We would show the coast of China, Japan, Australia, British Columbia, Alaska, Russian Possessions, South Sea Islands, Mexico, and Central and South America, in outline, with California in colors.

The first one hundred pages more or less of the report would be devoted to the geography, history, geology, commercial statistics, etc., of California, with general discription and statistics of the natural products of the State other than mineral. This part would be followed by descriptions of all the minerals exhibited at the exposition in detail, giving analysis, locality, mode of occurrence, uees, quality, etc. The third part would be a full account of all the gold, silver, quicksilver, lead, tin, and other mines represented at Paris, arranged by counties. Under the head of "gold" before the individual mines are described in detail, a general description of the gold mines on the coast will be given with descriptions of methods of prospecting, melting, and refining, including the hydraulic mining proccsses in which other countriee are specially interested. Full tables of the gold production of the State would also be published. The same plan would be adopted with the other metals under each heading.

Such a work as Mr. Hanks has planned would be valuable to other countries of the world as well as to our own citizene, and would be executed typographically in the beet style to compare favorably with the reports of the French government. Tbat government, particularly, takee great interest iu our metallurgical processes. We have before us, as we write, two pamphlets issued by the Society for the Encouragement of National Industry, during the expesition. One of tbese is a report by M. Troest, on the borax mines of California, prepared by Emile Durand. Another is on the "Metallurgy of Mercury in California," by M. G. Rolland. This givee detailed description of the various processes, with engravings, of the Livermore, Scott & Huttner, Knox & Osborne, and other furnaces, as well as the various condeusers in use. Such pamphlets should emauate from California itself, not from a foreign government, as all the information contained therein is more valuable to our citizens than to others.

It is found that there is no fund from which the Governor of the State can appropriate money for the publication of the Commissioners' report. He expresees himself as willing to assist the publication of the report, hut is powerless in the matter of the use of State money for the purpose. The publication should not be delayed until the Legislature meete. It is, of course, already known that California paid no expenses of the exhibit at Paris, hut at leaet she should pay for a report on it, such as Mr. Hanks proposes. Mr. Hanks wae recommended by the Governor to represent the State, and received his appointment from the President on this recommendation. It seems too bad that there will be no record of the whole proceeding frem official sources, unless private citizene contribute. A report of this character would bo extremely valuable to the citizene of this State and this coast, and it is to be hoped that money will be forthcoming from eome quarter for its publication.

The Geological Section.

The last two meetinge of the Geological Section of the Academy of Sciencee, have been of considerable intercet. Prof. Price presented a specimen of a mineral, probably the selenite of lead, from Nevada, which is, as far as is known, the first epecimen found on the coast. Indeed the only specimen which has yet been known ie an imperfect one from which Dana was compelled to describe it. Some of the parte of the specimen ehow nearly perfect crystale, and it is boped that Mr. A. W. Jackson will be successful in determining its crystalline form, as he promises to do. Prof. Price found that the mineral contained selenium, but has not as yet had time for any further analysis.

Mr. G. D. Gibbee presented a very interesting paper upon the subject of artesian wells, whicb we shall print in full shortly. Prof. Price followed with some remarke upon the purity of tbe water from these wells. He stated that the water, while it was certainly exposed to contamination with the drainage of the city, at the same time ae far as the analysis he had made had gone, he had never found the presence either of albumenoid mattere or of nitrates, or of ammonical compounde; and that the water had always proved to be pure enough for all usee. He found that the water from the serpentine rocks was usually richer in carbonates of lime and magnesia, while that from the saudstones was richer in sulphates and chloridee, with less of magneeia and more of lime.

Mr. S. B. Chriety presented the notes of some study and investigations, upon which he has for a long time been engaged, on the eubject of the "Genesis of Quicksilver Deposits." Ae this paper will also be shortly published in full, we give only some of the main points. The results of experiments with solutions in closed tubes at temperatures from 150° to 250° centegrade, and pressures from 150 to 400 lbs. of steam, sbowed that the sulphide of mercury was insoluble botb in solutions of alkaline carbonates and silicates, but where to tbe eame solutions sulphydric acid was added, the eulphide was disselved and cinnabar was formed. Mr. Christy was also able to produce cinnabar from the amorphous sulphide by treating it in the same manner with the water from the New Almaden Vichy Spring, to which sulphydric was added. The tendency of the investigation was to prove that the cinnabar deposits in general, and certainly at New Almaden, are theresulte of the action of solution of the sulphide in water.

Parke & Lacy's Hoisting Engines.

Messrs. Parke & Lacy, of 417 Market street, in this city, dealers in mining and other machinery, make a specialty of portable hoisting engines, of which they have issued a very neat illustrated catalogue. They keep these improved hoisting engines in all styles, loose drum, with rose or friction clutch, or with reverse link motion; vertical engines, horizontal engines, double engines with single drum, or double drum, or single engines with double drum. They are kept in various sizes and styles. These engines are warranted to be the power represented, and to give perfect satisfaction.

The style shown in the accompanying engraving is made from four to twenty-five horse-power, single and double. It is a single horizontal hoist, with vertical hoilers, and can be used for stevedores, pile-drivere, builders, wreckers, miners, railroad companies, etc., for pumping and hoisting. As a mining hoist it is very convenient and compact, and will be useful in opening up mines, or in working thoee which requirc no very expensive apparatus.

The Artificial Syntheses of Organic Compounds.

Extract from a paper read before the California Academy of Sciences hy John M. Stillman of the University of California.

I wish this evening to mention a few of the more striking examples of those discoveries of organic chemistry, where the products of nature have been produced by the hands of the chemist, and to show you the successive steps of the processes that you may see for yourselves how completely the wall between organic and inorganic has been overthrown; what complex compounds may he obtained by care and patience in the domain of organic chemistry. I shall not allude to the immense number of compounds which organic chemistry has prepared, which have not been discovered in animal or vegetable organism, some of which, as the aniline-dyes, have given rise to industries valued at the present day at millions of dollars, but shall confine myself to those products where the laboratory has succeeded in reproducing natural products of vital force in the animal or vegetable organism.

It is true that the artificial method of production is sometimes more expensive than that hy which it is produced in nature's laboratory, hut this is not always so, and there is always a prospect of new methods and new information giving a cheaper product than nature can produce.

In every case we will follow the process step by step from the elements themselves or from simple inorganic constituents, and every step shall he one whioh has actually been performed by chemists of repute. To commence with some of the simplor compounds, we will take first

Formic Acid.

This compound was first obtained from the bodies of ants by distilling with water;—formed, therefore, under the influence of vital force in the animal organism.

In the laboratory it can he obtained readily hy convenient methods from other organic compounds, hut also hy the action of CO and KHO which gives formic acid in combination with potassium, ($KHO + CO = HKCO_2$) which when treated with dilute sulphuric acid gives the free *formic acid*, ($2\,HK\,CO_2 + H_2\,SO_4 = H_2\,CO_2 + K_2\,SO_4$), identioal in all properties, physical and chemical with the formic acid derived from the ants themselves; is, in fact, the eame compound.

Alcohol

Is another product of organic life, and occurs in the decomposition of juices of plants oontaining sugar. It also can he huilt up from inorganic constituents, as follows:

Carbon and hydrogen unite directly to form acetylene, $C_2\,H_2$, under the influence of the electric spark.

This compound, acetylene, by the action of hydriodic acid gives ethane—$C_2\,H_2 + 4HI = C_2\,H_6 + 4\,I$, $C_2\,H_6$; and this in turn with chlorine gives $C_2\,H_6 + Cl_2 = C_2\,H_5\,Cl + H\,Cl$, which when treated with Ag OH gives alcohol, ($C_2\,H_5\,Cl + Ag\,OH = C_2\,H_5\,OH + Ag\,Cl$) *identical* with the compound produced by fermentation.

By oxidizing alcohol we also obtain another eompound, which is also an organic product, viz: *Acetic Acid.*

$C_2\,H_6\,O + O_2 = C_2\,H_4\,O_2 + H_2\,O$.

Glycerine

Can he obtained in the common method hy decomposing fats and oils, where it exists in oomhination as a product formed under the influence of vital force. It also oan he obtained from inorganic compounds hy a series of simple eteps.

If this oompound ethane, which we just saw formed from inorganic constituents, be treated with iodine, we have ethyl iodide formed, and this, with zinc, gives zinc ethyl, $C_2\,H_6 + I_2 = C_2\,H\,I + H_5\,I$, $2\,C_2\,H_5\,I + 2Zn = Zn\,I_2 + Tu\,(C_2\,H_5\,2)$. Again, if we heat CS_2, $H_2\,S$ and Cu together, we have a compound (CH_4) marshgas, formed $CS_2 + H_2\,S + 8\,Cu = 4\,Cu_2\,S + CH_4$; this, with iodine, gives $CH_3\,I$, methyl iodide; $CH_4 + I_2 = CH_3 + HI$.

These two compounds, zinc ethyl and methyl iodide, when heated together, form zinc iodide and a new compound, propane, $C_3\,H_8$, $Zn\,(C_2\,H_5)_2 + 2\,CH_3\,I = Zn\,I_2 + 2\,C_3\,H_8$. This, with iodine, gives propyl iodide, $C_3\,H_8 + I_2 = C_3\,H_7\,I + HI$, and this, with KOH, gives KI, $H_2\,O$ and another substance, propylene, $C_3\,H_6$ ($C_3\,H_7\,I + KOH = KI + H_2\,O + C_3\,H_6$), and this, treated with Cl and chloride of iodine, gives another compound, $C_3\,H_5\,(Cl_3)$, $C_3\,H_6 + Cl_2 = C_3\,H_5\,Cl + HCl$, $C_3\,H_5\,Cl + 2\,I\,Cl = C_3\,H_5\,Cl_3 + I_2$ which, with much water at a bigh temperature, is chauged to glycerine, $C_3\,H_5\,Cl_3 + 3\,H_2\,O = C_3\,H_5\,(OH)_3 + 3\,HCl$.

When glycerine now, which we have seen huilt up hy means of inorganic reagents from the elements themselves, is treated with HI, an inorganic reagent, it forms allyl-iodide, $C_3\,H\,(OH)_3 + 3\,HI = 3\,H_2\,O + 2\,I + C_3\,H_5\,I$, and this, again treated KSCN, which in turn is readily obtained from tbe elemeuts, we have formed a new compound, $C_3\,H_5\,Cl + KSCN = KI + C_3\,H_5\,SCN$, which has the odor and general appearance of the chief constituent of the oil from the common mustard, aud on closer examination proves to possess identical physical and chemical properties, the same hoiling point, odor, taste, uudergoes precisely the same changes with the same chemical reagents, and is in fact precisely the same substance as the natural mustard-oil, but formed entirely from substances which have been obtained from inorganic constituents.

Another Example.

We saw that hy inorganic agencies we could obtain a substance mcthyl iodide $CH_3\,I$, and also that hy the direct union of C and H we could obhtain $C_2\,H_2$, acetylene. Wben this acetylene is simply heated intensely we obtain a small quantity of henzol C_6H_6, which with bromine gives a compound $C_6\,H_5\,Br$. This $C_6\,H_5\,Br$. togetber with the $CH_3\,I$ treated with the metal sodium gives a compound toluol $C_6\,H_5\,Br + CH_3\,I + Na_2 = Na\,Br + NaI + C_7\,H_8$, and this hy heating gives anthracene, ($C_{14}H_{10}$.) Anthracene when oxidized gives anthraquinone $C_{14}H_{10} + 3\,O = H_2\,O + C_{14}\,H_8\,O_2$ and anthraqninone when treated with $H_2\,So_4$ givcs a new product, which finally treated with KHO and HCl gives alizarine. Now this alizarine ie found to he absolutely identical with the coloring material of the madder root, in composition, properties and chemical action. Fortunately, also, the anthracene can he obtained in quantity hy distilling coal-tar so that the alizarine of the lahoratory is much cheaper than the alizarine from the madder-root itself, and is of course just as good, being identical with it, so that it has nearly forced the true madder out of commerce.

Oil of Bitter Almonds.

Let us now start again from the same toluol, which we saw in the last example, huilt up synthetically from inorganic substances, but which is readily obtained from coal-tar hy distillation.

Wheu this tolnol is heated, and then treated with chlorine, we have a compound formed, the benzyl chloride ($C_7\,H_8 + Cl_2 = C_7\,H_7\,Cl + HCl$,) and thie with caustic potash gives henzyl alcohol, ($C_7\,H_7\,Cl + KOH = KCl + C_7\,H_7\,OH$,) hy oxidation we get from this a liquid compound which has the odor of hitter almonds, and on further examination proves to be identical with the oil of hitter almonds which is obtained from the kernels of the bitter almond itself ($C_7\,H_7\,OH + O = C_7\,H_6\,O + H_2\,O$). It is in fact the same substance as the purified and distilled oil of hitter almonds. This artificial oil of bitter almonds is not to be confounded with the cheap nitro-benzol or essence of mirbane, which possesses a similar odor, but is hy no means identical with the oil of hitter almonds, or the *benzaldehyde.*

Oil of Cinnamon.

Again, we find that if we take this artificial oil of bitter almonds, and together with this take common aldehyde (obtained hy oxidizing alcohol, which we have already seen can be prepared synthctically), and trcat the two suhstances together with HCl, we have formed a uew substance which is again identical with another natural product, viz., the chief constitnent of cinnamon oil, which is formed in the hark of the cinnamon tree ($C_7\,H_6\,O + C_2\,H_4\,O = H_2\,O = C_6\,H_2\,CH : CH . CHO$.

Wintergreen Oil.

Wintergreen oil also can be obtained very readily as a laboratory product hy the action of methyl alcohol (obtained also artificially like the common alcohol from tho $CH_3\,I$ already spoken of, and AgOH) upon salicylic acid under the influence of $H_2\,SO_4$. Salicylic acid is readily obhained from phenol or carholic acid hy treating the eodium salt of carbolic acid with CO_2 and Na, and decomposing the resulting salts with acids $C_6\,H_5\,O\,Na + Na + CO_2 = C_6H_5\,O\,Na, CO_2\,Na$. $C_6\,H_5\,ONa . COO\,Na + H_2\,O = Na\,HO + C_6\,H_5\,OH . COOH$.

Carbolic Acid.

Pheuol also, or carbolic acid, can be obtained synthetically hy the action of acetylene on $H_2\,SO_4$ and fusing the potassium salt of tho acid formed with caustic potash. The artificial product is in this case precisely the same as the chief constituent of wintergreen oil derived from the plant, when distilled and purified.

A couple examples more, and these the latest, will suffice.

Let us start again from two suhstances whose preparatione are already explaiued, propane $C_3\,H_8$ and toluol $C_7\,H_8$. When toluol is treated with Br in the cold a para-hrom-toluol is formed, $C_7\,H_7\,Br$.

When propane is treated with Br propyl bromide is obtained $C_7\,H_7\,Br$; when these two hromides are treated with metallic sodium, a new compound cymol $C_{10}\,H_{14}$ $C_3\,(H_7\,Br + C_7\,H_7\,Br + 2\,Na = 2\,Na\,Br + C_{10}\,H_{14})$ is obtained, and hy the oxidation of this substance hy means of sulphuric acid and potassium hi-chromate. Prof. Oppenheim obtaincd a small quantity of a substance of the odor,—appearance, crystalline character and chemical composition of common camphor, and the proof of the reaction may he substautiated hy the fact, that camphor treated with $P_2\,S_5$ or $Zn\,Cl_2$ gives this same cymol.

Indigo Blue.

The last example which I shall call your attention to is one, tbe completion of which has been effected in the present year hy Prof. Baeyer of Munich, to whom, in fact, we are chiefly indehted for the earlier steps in the synthesis. Baeyer had some time ago obtained the indigo blue by the action of PCl_3 and acetyl chloride $C_2\,H_{30}\,Cl$., on another compound, Isatin;—and in the present year he has succeeded in obtaining this isatin from limpler constituents, and has finished the complete synthesis of indigo-blue.

Startiug from *toluol*, which we have already used in the other examples, and the preparation of which has been explained; and treating when hot with chlorine, we have henzyl chloride. This treated with KCN, and hoiled with dilute acids, gives $C_6\,H_5\,CH_2\,COOH$, phenyl-acetic acid, $C_7\,H_8 + Cl_2 = C_7\,H_7\,Cl + H\,Cl$, henzyl chloride; $C_7\,H_7\,Cl + KCN = C_7\,H_7\,CN + K\,Cl$, benzyl cyanide; $C_7\,H_7\,CN + 2\,H_2\,O + H\,Cl = N\,H_4\,Cl + C_7\,H_7\,COOH$, phenyl-acetic acid; and this treated with HNO_3 gives a nitro-phenyl-acitic acid. By the action Sn and HCl on this latter compound is obtained oxindol, which, with nitrous acid, gives nitroso oxindol; this, with reducing agents, gives amido-oxindol; and this finally, oxidized with $Fe_2\,Cl_6$, or HNO_2, gives isatine. And, as we have already seen, the indigo hlue can he obtained from this hy PCl_3 or $C_2\,H_3\,O\,Cl$.

I have not attempted to give the most convenient or simple mode of obtaining these compounds; on the contrary, I havo often taken the more inconvenieut and expensive methods, with the one purpose of showing the possibilty of producing these compouuds from strictly inorganic constituents hy a series of consecutive reactions. In no case has a method been used in which any reagent is employed which cannot itself he obtained from inorganic constituents. In other worde, all these complex organic eompounds have been obtained without any hut the common and simple reagents of the inorganic lahoratory.

The achievements of organic chemistry in other directions I have no intention of discussing now.

The Martin White Case.

[Continued from last week.]

This disposes of the first proposition of appellant. The second and third are entirely without merit, and as tbey relate to well-settled doctrines of the law, they will be very briefly adverted to. There is not the slightest evidence of an intention on the part of the Paymaster location to ahandou their claim. The act of Henry in changing the language of the notice on the 10th of October, 1872, proves only that he had ahandoned the opinion that the course of the ledge was cast and west. So far from proving an intentiou to abandou a foot of his claim on the ledge, it proves exactly the reverse.

Nor do the facts present a single elemeut of estoppel.

Each party had exactly the same means of information. When the Shark location was made it was as much the business of its locators to know whether it was on the Paymaster vein as it was of Ward, the recorder. The truth probably is tbat no one at tbat time thought the two claims would conflict. It is idle, therefore, to say that any culpable silence on the part of Ward caused the expenditure of labor and money on the Shark. If the locators of that claim were deceived it was their fault and they must suffer the conscquences.

As to the change in the Paymaster notice from east and west to north and south that was, as we have seen, wholly immaterial. Tho simultaneous settling of the stakes entirely euperseded the calls of the notice and was the first thing that ever fixed the boundaries of the claim. If, after that, the Shark locators continued at work, they did so with their eyes wide open, as they di d everything else from the heginning to the end of their attempts to locate the ground. From the outset they had the same opportunities to know tbe truth that the other party had. If they have any hetter claim to the property than the defendant it is not because they were deceived or misled, but only because they can show a technical compliance with the law, while their adversaries cannot. It is upon this ground alone that their case has any semhlance of streugth, and upon this ground we think it clearly fails. The judgment and order appealed from ought to be affirmed and it is so ordered.

BEATTY, J.

I concur:

LEONARD, J.

Since the foregoing opinion was written two oasos (Gelsich vs. Moriarty et al., and Holland et al. vs. Mount Auhurn G. Q. M. Co.,) have been decided hy the Supreme Court of California, in hoth of which it is assumed, as a point heyond question, that the marking of a mining location on the ground so that its boundaries oan he readily traced is absolutely essential to the validity of the claim. This is in perfect accordance with our own views as above expressed. But in the latter of these cases it seems also to be held that the marking of the center line of the claim is not sufficient to satisfy the requirements of the law. The opiniou of the Court is very brief, and no reasons are assigned for the conclusions reached. We have, however, heen led by that decision to thoroughly recousider our own opiuion on this point, and the arguments of counsel pro and con. The result is that we are satisfied of the correctness of our first conclusion. A mining claim consists of a certain hreadth of surface, to he laid off on each side of the line of the croppings, with the mineral deposits included thereiu. The center line, as a matter of course, is to he a straight line conforming to the general strike of the vein as nearly as that can be ascertained. The side lines are to be parallel to the center line, and if as we assume to he the proper construction of the law, the end lines must he parallel and conform to the dip of the vein, which is at right angles to its strike it follows, with the conclusiveness of a mathematical demonstratiou that when the center is once definitely fixed the boundary lines can he traced (that is followed out) with absolute certainty. It may he that they could not be traced as easily and readily as if stakes were set at the corners, hut the difference would he very slight and of no practical consequence. In any case we think that the law should receive as liberal and beneficial a construction as is consistent with the object which Congress undouhtedly had in view in passing it. That object, we are satisfied, was not to save intending locators a slight amount of labor in tracing older claims, hut it was to make the boundaries of such older claims certain and immovable; to put an end forever to the shifting and floating of claims; to do away with an existing and intolerable evil. The whole object of the law is accomplished whenever, from the monuments on the ground, the boundaries of a mining claim can he traced with absolute certainty and without any practical difficulty, and for that purpose a definitely fixed center lino is sufficient.

BEATTY, J.

I concur:

LEONARD, J.

[By Hawley, C, J., Concurring.]

I concur in the conclusions reached by the Court that the judgment of the District Court ought to he affirmed; hut I am unwilling to give an unqualified approval of the construction given to the mining laws of the United Statcs.

If I entertained the opinion, as expressed hy tbo Court that "it is a surfaco parallelogram not less than fifty feet in width that must be located;" that the location on a vein "mnst be made hy taking up a piece of land to inclnde it;" that a vein "can only be located by means of a surface claim, and held only to the extent that it is included in the surface lines," and if —upon these points—I agreed "entirely with the views of counsel for appellant," I should he inclined to agree with tbeir conclusions that it is the surface location that "must he distinctly marked on the ground so that its hounderies can he distinctly traced."

But I do not helieve that it was the intention of Congress hy the passage of the eeveral acts referred to in the opinion of the Court, to produce an entire revolution in the system of locating mining claims. Some very important changes have been made and the rights of the locators have hcen enlarged and made more specific; hut, in my judgment, it is—as it was under the old system—the vein of quartz, the lode that is the principal thing constituting the location. The eurface grouud is but an incident thereto. The location of such a mining claim is distinctly marked on the ground so that its houndaries can be readily traced, by the placing of stakes along the lode and at the ends of tbe location, or hy such other monuments or marks as will clearly designate the numhcr of feet in length and the particular lode located. In my judgment the location need uot, necessarily, be the takiug up of "a piece of land" in the form of a parallelogram. When tho vein or lodc is sufficiently identified and marked, as above stated, tho laws of tbe local district fix the number of feet in width—of the surface ground—to which the locator is entitled. It heing, of course, understood that: "No claim shall extend more than 300 feet on each side of the middle of the vein at the surface, nor shall any claim he limited hy any mining regulation to loss than twenty-five feet on each side of the middle of the vein at the surface."

I differ with the Court upon another point discussed in the opinion. I think that after the lode is properly located, the locator has the right to 1,500 feet aloug tbe outcrop of the lode, "in whatever directiou it extends, irrespective of the vertical side lines of the surface houndaries" (dissenting opinion, Golden Fleece vs. Cable Con., 12 Nev., and that he would only he entitled to 1,500 feet in length, although the vein took such a course as to embrace more than 1,500 feet within the end lines of his surface location.

HAWLEY, C. J.

THE ELONGATION OF TREE TRUNKS.—The *College Quarterly* saye that experiments made at the Iowa Agricultural College show that the popular notion that the trunks of trees elongato is entirely erroneous. Tacks were driven into the trunks of various trees, and the distance between them accurately measured. At the end of the season they were found to have neither iucreased or decreased their distances. In the experiment, tree trunks were selected of all ages, from one year up to five or six, and in no case was there any change whatever noticeable.

IRIDESCENT GLASS.—Ornamental glassware in many styles, tinted with the glowing colors of the rainbow, is now making its appearance in the shop windows of Broadway and Fifth avenue. This is one of those brilliaut little achievements of science that delights the eye and pleases the imagination. To produce the colors, the glass, while in a heated state, is subjected to the vapor of chloride of tin. Shades of more or lcss depth or intensity are imparted hy adding to the tin chloride a littlc nitrate of strontium or harium.

ANOTHER "LARGEST" TELESCOPE.—Now that Professor Watson has hecame a permanent fixture of the University of Michigan, and will remaiu director of the observatory, hc has heen guaranteed hy the citizens of Detroit $60,000 for the purchase of the largest and most powerful telescope in the world, to be located at the observatory at Anu Arhor, Michigan.

RICHARD READE has heen recognized as Consul of England for Pennsylvania, Ohio, Indiana, Michigau, Illinois, Iowa and Wisconsin, to reside at Philadelphia.

MECHANICAL PROGRESS.

The Structure of Rails as Affecting Accidents.

Professor Thomas Egloston recently addressed the New York Academy of Sciences on the subject of "The Structure of Rails as Affecting Railway Accidents." He remarked, among other things, as follows: The destruction of rails is due to three causes. 1. Defects in the manufacture. 2. Improper mechanical or chemical composition. 3. Physical changes.

A very large number of raile are annually made which should never be put in any track. Their defects are often imperceptible to the naked eye, but they very soon begin to break. Statistics show that the breakage from defects in making increase until they have been used 18 months; then it decreases to zero, and after that rails break from different causes. The impact of the locomotive is apt to break the rail, very much on the same principle that is taken advantage of in breaking them up for the manufacture of smaller objects. A nick is made somewhere, and the workman then strikes a blow with a hammar at a point between the nick and the place where the rail is supported. This will sever the rail at the nicked place. Sometimes more than a second intervenes between the blow and the fracture.

Now, whenever holes are punched in rails for the fish plates, flaws are apt to radiate from them; and if these flaws are not planed or filed out, they may cause the rail to break, just as the nicks above mentioned. Such rails have been known to last no longer than eighteen months, and some have actually broken on the way from the manufacturer to their destination. There are establishments in this country and in Europe where they "doctor" such rails by filling up the flaws with a mixture of iron filings, sal ammoniac, and some adhesive substance. Beware of them, a poor cheap rail is dear at any price. The French government stipulates in its contracts for rails, that flaws shall be planed, drilled, or filed out; that the rails shall not be allowed to drop on the ground, but shall be carried by men and slid down. The Lyons railroad does not pay for its rails until 15,000 trains have passed over them.

By imperfect mechanical composition is meant imperfect union of the parts of rails. Steel heads are welded to the rest of the rail in a variety of ways, and this welding is necessarily imperfect. A number of sections of rails etched with acid plainly showed this want of homogeneity. Before such rails have lost weight appreciably, they are used up by the constant rolling they undergo. The advantage of a steel rail is its homogeneity, but a good iron rail, is likely to prove better than one of poor steel. The life of a steel rail is chiefly affected by the temperature at which it is rolled and annealed. It ought to last about 20 years on roads doing as much business as the New York Central. It is, however, unlikely that our steel rails will stand more than half this amount of traffic.

The effects of chemical composition are but little understood. Some of the purest irons have turned out utterly worthless. Apparently the absolute quantities of carbon, silicon, aluminum, phosphorus, etc., present are not of so much importance as their relative proportion. One specimen containing carbon 0.16, silicon 0.8, and phosphorus 0.012, could be bent double when cold, while another, containing carbon 0.58, silicon 0.56, and phosphorus 0.011 broke at once.

The physical tests for tensile and torsional strength, usually made on a portion cut out of the head of the rail, are not sufficient, because the flaws before spoken of exist mostly in the flange of the rail, and fracture usually begins there.

The effect of cold rolling and shocks that a rail is exposed to was shown by a piece of steel rail, which had been worn by a traffic of 60,000,000 tons. The head had been somewhat flattened, and the flange driven down into the foot to a certain extent. Under such usage an *iron* rail would have gone to pieces long ago.

Sometimes steel rails crumble all at once and pieces fall out of the head. This is probably due to some physical defects or to crystallization from shocks. The cause has not yet been definitely ascertained.

Professor Egleston asserted that there was no such thing as fibrous iron; what appeared so being simply crystalline with the ends drawn out. A sharp blow would cause this to fall off and show the crystalline structure beneath.

NEW METHOD OF HEATING TIRES.—In the workshop of the railroad from Moscow to Nijni, the tires of the wheels are not expanded by the direct action of fire, but by hot water, before being put on the wheels. With the assistance of a movable crane they are plunged into a metallic cistern containing water, which is kept boiling by means of steam from a boiler close by. An immersion for ten minutes expands a tire sufficiently to enable it to pass around the wheel. The heat is more uniform and the contraction more regular than when a tire is heated by fire in the usual way. It is said that in six years there was only one case of fracture of the water-heated tires, and only one per cent. of them loosened upon the wheel.

Iron vs. Steel Bolts.

W. Mathieu Williams, in the *Metallurgical Review*, discusses at some length the question of iron *versus* steel bolts. He considers the question as one of much importance and one, just now, very properly occupying much attention among the metallurgists of all nations. He thinks the steely attributes of the bolts employed in the experiments alluded to were directly detrimental. Increased tenacity as measured by the application of a gradually increasing strain, was accompanied by increased weakness in relation to a sudden shock. The case is an extreme one undoubtedly and the test excessively severe; but admitting this as regards degree, does it not represent the kind of strain to which boilers, girders, ship-plates, bridges, and all structural applications of iron or steel are more or less subject.

Let us take a boiler first. While the heat is being gradually applied, the expansive force of the steam gradually developed, and the boiler firmly at rest, the plates are submitted to a strain fairly represented by the hydraulic or screw testing machine; but if, when the metal is thus strained, the boiler is submitted to any kind of shock, the conditions are entirely changed. A vibration traverses its structure; waves of compression and extension suddenly add to the roaring strain of the expanding steam in one place and diminish it in another. In proof of the effect of this, the following experiment may be made by anybody who has a testing machine at command. When the strain is approaching the breaking point, let the plate or bar under trial receive a light but smart tap sufficient to produce a molecular vibration. It will instantly break, even though at a considerably less strain than would have broken it if undisturbed. The boilers of all kinds of marine engines and of locomotives are subject to violent vibratory shocks. Suppose we have two boilers, one of steel and the other of soft malleable iron, and both have been tested by hydraulic pressure to the same extent. Which would be most likely to give way under practical conditions, and subject to ordinary and extraordinary shocks while worked nearly up to their tested pressure? If compelled to sit on the safety valve of one or the other, I should choose the soft iron.

The practical conclusion to which all the above-stated facts and reflections point is, I think, that for all purposes where resistance to vibratory shocks or suddenly applied strains of any kind is demanded, the old-fashioned wrought iron is more reliable than steel of any kind that is at present obtainable. I do not, however, maintain that we should be satisfied with this conclusion, but, on the contrary, regard it as indicating the direction of future effort, which should be devoted to the softening and toughening of these new steels in order to combine, as far as possible, some of their valuable properties with those of wrought iron.

A DEVICE for cleaving stone has recently been introduced in Germany, which promises to be very useful for splitting granite and other stone blocks. The cleaving is effected by means of a prismatic steel cutter inserted with wedges in the under side of the hammer, and opposite a similar one below on the anvil bed. The granite-block to be cleft is pulled on rollers over the lower cutter (which is slightly higher than the rollers), and into the proper position. Then a rapid series of blows is given from a short hight, followed by a strong blow from a great hight. Thus a plate is cut vertically with accurately even surface. The block is next pushed on one-plate thickness, and the process is repeated. The plates obtained are afterwards divided into cubical blocks by means of a steam-hammer, arranged quite like the former, except that the plates, instead of lying on rollers, are placed on small tables resting on spiral springs. By the weight of the stones the springs are compressed, so that the stones come to lie on the lower cutter.

POCKET MICROPHONE.—M. Trouve has invented a cylindrical device which resembles a small dark-lantern, with a carbon crayon instead of a candle. The device, as its name implies, is designed for collecting small sounds. When placed in the middle of a room, it reveals all secrets. It transmits the voice admirably to a receiving telephone, even when the speaker stands twenty-eight feet or more from the microphone. When a watch is placed in the interior, it seems to be making unheard-of efforts to get out. The instrument can be easily used for revealing the normal or morbid movements of the heart or lungs.

A NEW wall covering is extensively advertised in England. It is so durable that disease germs can be burnt off it with fire or washed off with acid; so soft that it can be stamped and worked into beautiful forms; so tough that it can be scrubbed frequently, and so cheap that it can be bought for fourteen cents a foot.

A DELICATE mechanical feat was recently accomplished by a watchmaker of Providence, Rhode Island, who drilled a hole throughout the entire length of a common pin, from head to point, just large enough to admit the passage of a fine hair.

FROM the debris of the coal mines France makes annually 700,000 tons of excellent fuel, and Belgium 500,000 tons. Germany makes fuel for the most part from peat and similar earths.

SCIENTIFIC PROGRESS.

A New and Startling Contribution to Science.

The scientific world has recently been somewhat startled by the bold announcement, and apparent demonstration, that the so-called elements of chemistry are no "elements" at all, in the ordinary acceptation of that term; but that there is good reason to believe that they are all, or nearly all, compound bodies, capable of being resolved into other compounds; in fact that there is but one original form of matter—hydrogen. This announcement is made by the well-known English scientist, Prof. J. Norman Lockyer. The announcement was first made, we believe, to the French Academy of Sciences, by the venerable Dumas, at its meeting on the 28th of October last, by the reading of a note from Prof. Lockyer, in which that scientist said: "Reasoning from analogies furnished by the behaviors of known compounds, I have discovered, that, independently of calcium, many other bodies, hitherto considered as elements, are also compound bodies."

Mr. Dumas, in communicating this note to the academy, observed that this discovery was the result of three years of assiduous research, in which Mr. Lockyer had, with the greatest care, compared spectra of the chemical elements with the solar spectrum and other luminous bodies. In a private note to Mr. Dumas, Mr. Lockyer stated that he should shortly send photographs and such other details as would carry conviction to the minds of the members of the academy.

It is well known that Mr. Lockyer has been working in this direction for some three years. But as yet the text of his paper has not been fully made public, and some time must necessarily elapse before his supposed discovery can pass the critical examination which alone can give the announcement a standing before the scientific world.

The London *News* of November 26th brings the following additional information in regard to this alleged discovery:

"In the presence of a small party of scientific men Mr. Lockyer, by the aid of a powerful voltaic current, volatilized copper within a glass tube, dissolved the deposit formed within the tube in hydrochloric acid, and then showed by means of the spectroscope that the solution contained no longer copper, but another metal, calcium, the base of ordinary lime. The experiment was repeated with other metals, and with corresponding results. Nickel was thus changed into cobalt, and calcium into strontium. All these bodies, as is well known, have ever been regarded as elementary—that is, as incapable of being resolved into any components, or of being changed one into another. It is on this basis that all modern chemistry is founded, and should Mr. Lockyer's discovery bear the test of further trial, our entire system of chemistry will require revision. The future possibilities of the discovery it is difficult to limit. Mr. Lockyer is one of our best living spectroscopists, and no man with a reputation such as his would risk the publication of so startling a fact as he has just announced to the scientific world without the very surest grounds. He is known by his friends as somewhat sanguine, and he does not pretend to be an accomplished chemist, but he was supported yesterday by some of our leading chemists, all of whom admitted that the results of his experiments were inexplicable on any other grounds but those admitting of the change of one element into another, unless, indeed, our whole system of spectrum analysis is to be upset, the other horn of a very awkward dilemma. Since a hundred years ago Priestley discovered oxygen and founded modern chemistry, there has been, there could be, no discovery made which would have such an effect on modern science, as that the so-called elements were no longer to be considered elementary."

Within the last few years a large number of new substances have been added to our list of "elements," and numerous examples are recorded where bodies, supposed at first to be elementary, have yielded to the crucial tests of the chemist, and been proven to be compounds. So much has been done in this direction that the question has often been asked, "Are not all the elements really decomposable substances?" With the new lights, and constantly increasing appliances which are being brought forward to aid in unlocking the secrets of nature, it seems as though we should soon be able to answer the above question in the affirmative. It is an interesting fact that the spectroscope, which has done so much since its discovery in opening the way to new revelations in science, should now once more be found leading the way to what promises to be one of the most interesting and important discoveries ever made in the domain of scientific research. The details of this discovery will be awaited with the greatest interest.

CLEOPATRA'S NEEDLE AND WIND FORCE.—It is pointed out that the factor of safety or stability of the Cleopatra's needle is too small. As it stands, it is already calculated to bear a pressure of 90 lbs. to the square foot, whereas the force of no hurricane is believed to exceed 25 lbs. to the foot. Mr. John Holden, architect of Manchester, recalls the fact that on the 7th day of February, 1868, the pressure registered at the Liverpool observatory was over 60 lbs. to the square foot. The instrument, in charge of Mr. Hartnup, only registered up to 60 lbs., but his opinion was that the pressure reached between 70 lbs. and 80 lbs. to the square foot. At Liverpool, on the 27th of September, 1875, the pressure registered was 70 lbs. to the square foot; and at the same place some time in April, 1867, the pressure was 45 lbs. At Sydney, Australia, on the 10th of September, 1876, the Government Astronomer reports "that the wind in some of the gusts lasting several minutes attained the extraordinary velocity of 153 miles an hour, equal to a pressure of 117 lbs. to the square foot; and during 12 minutes between 12 and half-past the velocity of the wind was 112 miles per hour." The question of the velocity and pressure of the wind is of great importance, especially in the manufacturing districts; and for many years the firm of which Mr. Holden is a member, in calculating the stability of factory chimneys, has assumed the pressure to be not less than 80 lbs. to 90 lbs. on the square foot.—*Engineer.*

MYSTERY OF PERFUME.—No one has yet been able to analyze or demonstrate the essential action of perfume. Gas can be weighed but not perfume. The smallest known creatures—the very monades of life—can be caught by a microscope lens and made to deliver up the secrets of their organization, but what it is that emanates from the pouch of the musk deer that fills a wide space for years with its penetrating odor—an odor that an illimitable number of extraneous substances can carry on without diminishing its size and weight—and what it is that the warm summer brings to us from the flowers, no man has yet been able to determine. So fine, so subtle, so imponderable, it has eluded both our delicate weights and measures and our strongest senses. If we come to the essence of each odor we should have made an enormous stride forward, both in hygiene and chemistry, and none would profit more than the medical profession if it could be as conclusively demonstrated that such an odor proceeded from such and such a cause, as we already know of sulphur, sulphurate, hydrogen, ammonia and the like.

A NEW ELECTRICAL DEVICE.—P. Lacour has devised a toothed wheel of soft iron—a phonic wheel—which turns on its axis so that its teeth pass near one pole of an electro-magnet without touching it. An intermitting electric current, regulated by the vibrations of a reed or tuning-fork, traverses the coils of the magnet, so that it periodically attracts the nearest tooth. The wheel, turning with such velocity as to traverse the space between two teeth at each period of the current, maintains a uniform movement. It is well-fitted for use as a chronograph, for finding the number of vibrations in a given musical note, and for establishing synchronism in telegraphy.

NON-TRANSPARENCY OF FLAME.—It has been commonly believed that flame is transparent. Some observations have lately been made by M. Van Eyndhoven on the flame of a hat'ewing burner with one of Sugg'e photometers, and he found in two experiments a difference of 1.5 candles, or 17% to 18%, between the narrow and the broad side of the flame—the latter giving most light; whence he infers that the flame is not transparent. For this reason the entire luminous power is not obtained from an Argand burner. For good street lighting, the slit of the burner and the direction of the street should be at right angles to each other.—*Eng. Mech.*

SCIENTIFIC SKEPTICISM.—M. Bouilord finds it so difficult to accept the ordinary explanations of the phonograph and the telephone, that he propounds some new and curious hypothesis. He asks whether it is really the phonograph that repeats the sound, or whether the repetition is not due either to some kind of echo or to some unconscious action in the vocal organs of the bystanders; and whether the telephone does not act simply as a good conductor of sound, independently of any electric currents.—*Comptus Rendus.*

A ROYAL OBSERVER.—Dom Pedro was one of the observers of the late transit of mercury, at the imperial observatory of Rio Janeiro. The contacts were perceived and noted simultaneously by the Emperor and all of the other observers. Liais's new method was employed, and the result differed from calculation by less than one-fifth of one per cent. in right ascension, and by only one-tenth of one per cent. in declination.—*Comptes Rendus.*

SOLIDIFICATION OF PETROLEUM.—Even the lightest petroleums may be partially solidified, by mixing them with an aqueous decoction of soapwort. A mucilage forms, which is so thick that the containing vessel can be overturned without any portion running out. If a few drops of phenic acid are stirred into the mucilage, it soon becomes liquid again.—*La Nature.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MOORE MINE DITCH.—*Dispatch*, Dec. 21: The building of the Moore mine ditch, is progressing rapidly, the workmen now being a short distance from Jackson. The water will be piped across Jackson creek just below town to the ridge on the opposite side. There are about 100 men at work, and it is expected that the work will be completed in about two weeks.

RICH MINE.—*Ledger*, Dec. 21: W. Vandament has struck a quartz ledge of extraordinary richness at Irish Town, near Pine Grove. F. M. Brown of Sutter Creek, has purchased an interest in the claim. Those who have seen the claim pronounce it one of the most important mineral discoveries ever made in the county. The ledge is said to be eight feet in width. A piece of quartz, weighing between 35 and 40 pounds, was exhibited the other day, which was studded all over with free gold. A fair estimate places its value at from $70 to $80.

ITEMS.—It is reported that rich ore has been struck on the Centennial. The machinery at the Hercules will soon be running. The Empire mill is still running by steam. The sulphurets are paying well, and the rock keeps up its quality. The Keystone mine is yielding some very rich rock now, in which free gold in large quantities is plainly visible to the naked eye. At the Grass Valley claim everything is in readiness for hydraulicking as soon as water can be had. Over 1,000 feet of pipe is in position.

BUTTE.

OUR RESOURCES.—Oroville *Mercury*, Dec. 20: Mining brings more money into the town every week than all other resources combined. The weekly shipments of the Chinamen working in the lava beds alone range from $10,000 to $15,000. This amount is sent to the Mint at San Francisco, coined and returned to this city, where a large percentage of it is placed in circulation. In addition to the productions of the Chinese, the bank purchases about $4,000 worth of dust per week from the numerous men working upon a small scale in the neighborhood. And semi-occasionally, the Spring Valley Company send in from $50,000 to $75,000 worth.

CALAVERAS.

NEW QUARTZ MILL.—*Chronicle*, Dec. 21: While in Murphys lately we visited a quartz mill recently erected there by Mr. Smyth. The method of working the quartz is a modification of the Paul process. The ore is first broken to a suitable size and then thoroughly dried. It is then put under stamps and crushed. From the battery the crushed ore is carried in elevators to the "pulverizer," a large, revolving, iron cylinder, in which it is reduced to an impalpable powder by the attrition of quartz rocks with which the cylinder is partially filled. From the pulverizer the powdered ore drops on to a copper-covered revolving cylinder, and from that descends to amalgamating surfaces. There is an abundance of ore in close proximity to the mill and facilities for working it are excellent.

EL DORADO.

KELSEY.—Placerville *Democrat*, Dec. 21: Work on this mine is still progressing, notwithstanding many of the workmen have been obliged to lay off on account of sickness. The shaft has been sunk seven feet during last week, and the lower level has been driven ahead eight feet and timbered its entire length. A winze has been started to connect with the lower level at a distance of 75 feet from the shaft. The ore throughout is looking as well as heretofore, and the developments so far are giving great satisfaction to all concerned in the mine. It is said that the clean-up of last week, was better than was anticipated. The sulphurets are giving the most satisfactory results both here and in San Francisco, and I am told that parties in the city are endeavoring to purchase them at a high figure. Work on the first northern extension has commenced and developments so far give great promise.

INYO.

KEARSARGE.—*Independent*, Dec. 14. Superintendent Gray has just finished putting the ventilating apparatus into the long tunnel, preparatory to driving ahead to connect with the shaft. Operations are suspended for the present, but it will be but a few days, or a month at the most, before he will have a full force at work on the two upper tunnels. By early spring he expects to have an Ingersoll drill at work by contract to drive in the main tunnel from just above the mill to the mine, the contract to be not less than 2,000 feet of tunnel. At least, negotiations to that effect are now pending.

MONO.

We take the following from the Bodie *Weekly Standard*, Dec. 18th:

HARRINGTON CON.—This promising property is situated on the eastern slope of Bodie bluff, and is being developed by a tunnel running east. A distance of 300 feet has been made into the hill, and work still progressing with cheering results. Timber and lumber are now on the ground for timbering and the construction of house at mouth of tunnel. The property is under the charge of James Harrington, and is stocked in San Francisco.

SUMMIT.—The engine foundation is completed, and the engine is being set in place. The timbers, etc., for shaft house are framed and ready to be set up. The building is now being put together. As soon as the engine is in place, which will be in a day or two, work will be resumed in the drifts and in the shaft.

INCA.—This mine is situated on the summit of Silver Hill, and at the end of the Champion and Goodshaw. The shaft is down about 35 feet. In the crosscut at the bottom a very fine looking six-inch vein has been cut. This mine is bonded to Lecker & Co., of San Francisco, who, if we are not wrongly informed, have a good bargain.

LONDON.—Ledge looking well in the bottom of the shaft. Work will soon be suspended for the winter. J. C. Lennon has this property bonded, and there is every probability that if he can get it into good hands there will be some valuable developments made in the claim next year.

SOUTH BODIE.—Work on main shaft being pushed along with all possible speed, and the cribbing following the work as fast as distance is gained. Material passed through during the week of a most favorable character, and everything doing well about the works.

SPAULDING.—Since last weekly report the shaft has been sunk 14 feet, making a total depth of 386 feet. Rock in the bottom getting harder. The crosscut west is now in 18 feet. Have cut into a hard formation, which has the appearance of being the east wall of the ledge for which this crosscut is being run.

SOUTH BULWER.—Shaft has reached a depth of 252 feet. The crosscut east, on 200 level, is in from main shaft 35 feet, the face is hard, blasting porphyry, mixed with stratas of quartz. The ground is rapidly assuming a more favorable appearance, and indications point to the near presence of an ore body.

NOONDAY.—The shaft is now down 102 feet, and the ledge is 2½ feet wide. The ore will run from $30 to $60 per ton by assay. This development is noticeable because of its location, nearly two miles north of Bodie bluff.

CALIFORNIA.—The total length of west crosscut is 24 feet; that of east crosscut is 14 feet. Feeders of quartz are frequently cut in each direction.

BLACKHAWK.—The east crosscut was run seven feet the past week; total length 102 feet. The new shaft has been sunk 14 feet; total depth, 162 feet. The entire bottom of the shaft is in vein formation.

DEVELOPMENT IN THE BODIE.—Quite an interesting development has been made in the Bodie mine during the past week. The east crosscut from the bottom of the Bruce vein intersected the Gildea ledge at a distance of 25 feet from the winze. The ledge was of about the same character as on the level above. This winze is 100 feet deep, and assures the continuation of ore for that additional distance, as well as the prospect that the Bruce and Gildea come together at a depth, as they have done in south, where they joined at a distance of 257 feet from the main cross-cut.

PLACER.

ROCK CREEK MINE.—*Herald*, Dec. 21: Molin & Heenan, of the above-named mine, which is undoubtedly one of the best quartz mines in Placer county, are making fine improvements on their mine. They are enlarging their shaft and timbering it with 8x8 red fir timber, and are otherwise adding greatly to the working facilities of the same. The last crushing of 69 tons of rock taken from the 80-foot level of this mine paid $35 per ton. Messrs Molin & Heenan are again about ready to take out quartz, and expect to have another crushing in a few weeks.

HAZARD MINE.—Dutch Flat *Forum*, Dec. 19: This claim is thought to be on the same channel as the Weske and the Swiftshore. Up to the present time about $90,000 has been expended on it. Its present organization under Colonel Keown was completed in 1876. After a partial abandonment, and the burning of the mill by incendiaries, Col. Keown, with the old arastra now in use, commenced crushing the tailings of the dirt taken out years ago, which paid so well that the Colonel set to work among his personal friends and succeeded in forming the company as it now stands. The old arastra is still going, and still pays. The modern buildings are all good, complete and commodious, and arranged, especially the engine house, so as to facilitate the work and secure economy in labor and time. The main shaft is 160 feet deep, 8½x4½ in the clear, and the tunnel running up stream on Volcano canyon, 2,140 feet long, with numerous side drifts to prospect the width and richness of the channel, which they have unquestionably been on all the time. The results of the tunnel have not been as good as was expected. Nevertheless, rich spots have been found and the prospects are good.

SIERRA.

ITEMS.—Downieville *Messenger*, Dec. 21: Water is getting very scarce at the Buttes mine, and report says that a number of men have been suspended from work on this account. We shall soon get rain, and then water will be plenty. Pipe clay begins to appear in the cracks of the lava in the Pliocene shaft. Bald Mt. Extension tunnel was in 125 feet last Friday. The contractor is pushing it at the rate of eight feet a day. The Bonanza company, of Howland Flat, have let a contract for running 1,400 feet of their tunnel. The price is some $3.50 per foot. We are informed that the Bald Mt. mine is very wet just at present, the ground being harder to keep up than at any previous time.

TUOLUMNE.

HUNTER MINE.—Stockton *Independent*: Specimens of rich quartz have been taken from this mine. They were obtained from nearly the top of the ore chimney. A tunnel has been run which strikes the lode at a depth of about 200 feet from the surface, and the rock is found equally rich in free gold. California capitalists inclined to engage in mining enterprises will find in "Old Tuolumne" a field for quite as safe ventures as in the more distant argentiferous regions of the State of Nevada and its neighboring Territories. Ex-Assemblyman W. G. Long is Superintendent of the Hunter mine.

NEVADA.

LINCOLN COUNTY.

RAYMOND & ELY.—Pioche *Record*, Dec. 21: The 30-stamp mill of this company will start up to-day on low-grade ore, of which they have a lot on hand. At the mine, crosscutting is still continued on the 1400 level, expecting to strike the ledge at any time. The upraise on the 12th is looking well, and are taking out considerable low-grade ore on the 10th.

HILLSIDE.—The Hillside furnace will not be started up until the 1st of January, when J. B. McGee, the manager, will return from the Bay. The work at the mine continues as usual.

MOUNT ROSE DISTRICT.

MAMMOTH.—Winnemucca *Silver State*, Dec. 24: Col. W. T. Robinson, Superintendent of the Mount Rose M. Co., arrived here yesterday. He brought down specimens from the mine, some of which weighed 25 or 30 pounds, that equal in richness anything we have yet seen from the Paradise mines. The Mount Rose M. Co.'s mine was formerly known as the Mammoth, that being the name under which it was located and recorded. It cropped out about 30 feet high and over 20 feet thick on the side of the mountain, and was considered a mass of barren quartz, because it had not been prospected. The original owners disposed of it a short time ago to Col. Robinson, for a San Francisco company, by whom it was incorporated under the name it now bears. Ten miners are now at work on the mine, crosscutting the ledge by a drift started in the quartz on the lower side of the croppings, about 30 feet below the apex of the lead, and also drifting along the hanging wall. The crosscut is 25 feet in quartz, and as yet there are no indications of being through it. The ore resembles that found in the Mountain Bride and Red Deer, and a lot of it worked $350 to the ton, while selected specimens assay up in the thousands. About 75 tons of fine ore is now on the dump, having been extracted from the crosscut and the drift on the hanging wall, which is also in good ore.

ARIZONA.

SILVER DISTRICT.—*Sentinel*, Dec. 14: Mr. W. Hammond arrived on Thursday from this promising district, bringing flattering accounts of the developments thus far made. While prospecting he found the old Snively mine, which has long been hunted for and seemed to be lost. Mr. Hammond, however, made some other discoveries, that bid fair to realize all the wonderful predictions made for this region years ago. One especially, to be called the Hammond lode, crops out largely for about three miles, most of it being taken up, and is in a limestone formation. The ridge is capped with hard rock from two to 10 feet thick, like a blanket, under which lies abundant ore, that crops out on each side of the ridge, and the lode must be about 60 feet wide on top. It is five miles from the river, with a good natural wagon road up a wash, directly to the mine. The ore carries much gold, but is full of silver sulphurets.

SANTO DOMINGO.—Much attention is at this time being attracted to this, and the mines belonging to Messrs. Smith & Purdy are truly developing into very valuable properties. These gentlemen own several claims in the district, and have spent much time, labor and capital in opening and prospecting them. The El Manto, Gualalupe and Fresh Start mines have been worked to a greater extent than the others, and at a depth of 110 feet, the bottom of the deepest shaft, the showing is first-class, warranting the investment of any amount of capital. Smith & Purdy also own a mill-site, which from the nature of things, has a great and lasting value, covering as it does, all the available water on the American side of the boundary line, and being very accessible from the mines. The principal mines of the district are about nine miles north of the boundary line and some 40 miles south of the famous Ajo mine. Rarely rich lodes are found on both sides of and close to the line, and the same mill-site has sufficient water for them all. Mexico imposes no duties on the exportation of ore, and that started from the Sonora side of the line could be hauled to and reduced at the mill-site on the American side, thus saving the heavy tax levied by Mexico upon the exportation of precious metals. La Puerta de Liberted, a safe harbor in the Gulf of California, is but 60 miles distant, and supplies could be landed thereat cheaply and safely.

MONTANA.

ITEMS.—Butte *Miner*, Dec. 3: Last week W. A. Clark purchased of John Stinson 100 tons of high-grade manganese smelting ore. Messrs. Rundell & Co. have taken a steam engine to Brown's gulch, to be used in driving their arastra during the winter. Messrs. Gassert & Reeding's claim, on the Burlington lode, has been bonded to Col. L. M. Black and Mr. John Connor for six months, for $30,000. The Green Campbell mill, at Silver Star, is to have five stamps more, making its total capacity 15 stamps. Late sales of interests in the Gagnon claim have taken place at a rate which would make the entire claim worth $200,000. The Dexter mill is to be made practically a new mill. The Clipper mill has been improved. It has reduced as much as 10 tons per 24 hours.

UTAH.

ALTA.—Salt Lake *Tribune*, Dec. 11: Everything looks well in this camp. The discharge of men from the Flagstaff resulted from the fact that a large force was put upon the ore breasts while prospecting was neglected. The ore body gone, less men must be employed until further breasts were found. These were readily discovered, and work goes on again. J. J. O'Toole is superintending the Lavinia. He works about 40 men. Though the recent ore shipments have not been extensive owing to inferior hoisting facilities, rich ore bodies are nevertheless known to exist in the mine, and as soon as the hoisting machinery is set, developments of a highly encouraging character may be expected. Mr. W. E. Hall, superintendent of the Prince of Wales, Big Cottonwood, has after a great deal of dead work, discovered in the lowest level ore which proved richer and more extensive as developments progressed. A real bonanza is expected. The Vallejo is being profitably developed. The Idaho, above Grizzly Flat, has a 6-inch vein of rich ore. It is about to be opened under the management of W. E. Hall. The Toledo, together with the Reed & Benson, City Rock, Live Yankee and Emma, is working a full complement of men, and yielding up the precious metal in gratifying profusion. The great drawback to the successful working of the other mines is the lack of machinery. There are hundreds of properties in Little Cottonwood to-day fully as good, if not better than those above enumerated, which can not be developed because the owners have not the necessary means.

STORMONT.—Silver Reef *Miner*, Dec. 7: The Buckeye and Last Chance are hoisting a large amount of rich ore. We must not forget that Captain Lubbock has struck it rich in the Maggie within a stone's throw of these mines, on the spot where he put down the diamond drill. The drill revealed the existence of the ore, and a shaft was sunk at once to work the same. Some very rich specimens of chloride and native silver were shown us from the new discovery, and ore from the same is being hauled to the Christy mill. The celebrated California mine is but a few rods distant, and is worked by steam hoisting-works. A very small engine and boiler does the work, and we wonder that such machinery is not more extensively used in the district. Others, however, are preparing to erect steam hoisting works.

MOUNT BALDY DISTRICT.—*Tribune:* A shipment of 10 tons of ore from the Deer Trail mine, Mount Baldy district, Beaver county, was made this week which assayed $360 in silver and $30 in gold. The ledge is now over four feet in width and is constantly improving.

Bullion Shipments.

Since our last issue, we have noticed the following shipments of bullion:

California.—Bodie, Dec. 17th, $23,821.40; Dec. 23d, $12,300; Extra, Dec. 10th, $2,062; Dec. 13th, $1,662; Dec. 18th, $2,800; Standard, Dec. 20th, $16,854.94.

Idaho.—Black Jack, $10,700.16.

Nevada.—California, Dec. 21st, $216,541.63; Grand Prize, Dec. 23d, $27,000; Jefferson, Dec. 18th, $2,049.07; Manhattan, Dec. 17th, $10,900; Dec. 19th, $11,100; Dec. 23d, $11,034.88; Navajo, Dec. 23d, $5,200; Northern Belle, Dec. 16th, $4,386.90; Dec. 18th, $3,478.24.

The *Sentinel* reports shipments from Eureka, as follows: Dec. 17th, $1,447.26; Dec. 18th, $1,732.61; Dec. 19th, $4,444.74; Dec. 22d, $5,493.88.

Utah.—We are indebted to the Salt Lake *Tribune* for the following: The bullion receipts at the Union Express office for the week ending Dec. 19th, were as follows: Ely Mill, Dec. 17th, $1,200; Ontario, Dec. 17th, $2,798.73; Dec. 18th, $2,476.00; Dec. 19th, $4,019.52; Ontario Mill, Dec. 13th, $2,645.20; Dec. 14th, $2,765.87; Dec. 16th, $7,026.61; Silver Reef, Dec. 13th, $5,176.90; Dec. 18th, $22,555.52; Dec. 19th, $1,700.60.

New Incorporations

GREAT HOPE M. Co.—Location: El Dorado county, Cal. Capital, $50.000. Directors—Wm. Boden, Alexander Gerdes, Charles Joost, Benjamin Dore and Henry Frank.

IDAHO G. & S. Co.—Location: Eureka district, Nevada. Capital, $10,000,000. Directors—A. B. Forbes, Charles Webb Howard, B. M. Atchison, W. B. Summer and Thomas Findley.

EAST MAMMOTH G. & S. M. Co.—Lake district, Mono county. Capital, $5,000,000. Directors—W. R. Loose, James Morgan, Alexander Rutherford, F. M. Adams and K. Meyers.

CHIMNEY PEAK G. M. & M. Co.—San Diego county. Capital, $1,400,000. Directors—David Neahr, John F. Haviland, W. H. Doxlake, H. M. Ellsworth, and George H. Rice.

THE assessments on Belmont stock since Dec. 9th, 1875, amount to $225,000, and the bullion receipts from the mine, to $37,000.

Notes on Trinity County.

The following information in regard to the mines of Trinity county, we obtain from an old and intelligent resident of that region. The gold product of Trinity will amount tbis year to about $2,000,000, the most of it taken from the placer mines. This is ths largest production mads for the past 20 years, though it is probahle enough tbat it will bs surpassed the coming year, should water be abundant. As Trinity polls only about 800 votes, this gives $2,500 per year to each voter; a hetter showing measursd by this rule, than can he made by any other county in the State. To date the rainfall amounts this season to ahout 7 inches, more thau has heen had in the central or auy of the other mining counties further south, hut not enough to start hydraulic washing, hy which method most of the gold dust is now taken out here. There is a great extent of good hydraulic gravel ground in Trinity, not a tenth part of which has yet heen utilized for want of capital. No sucb opportunities for investing money in this line of business exist elsewhere in California. Buckeye mountain, a high ridge lying hetween Stewart's fork and Rush creek, a few miles east of Weaver hasin, is supposed to he composed wholly of pay gravel. The top of this ridge is 1,500 feet ahove the adjacent streams. It has an average width of four or five miles, and prospecting shafts sunk to a depth of over 100 feet, indicate that the entire mountain would pay to he washed hy tbe hydraulic process. A company have built a ditch for hringing water upon this mountain, hut for lack of sufficient means to properly open up their ground, they have not yet heen ahle to make such a prodnction, as with a small additional expenditure of money could surely he reached. They have pay gravel enough to last a hundred years, and one of the finest water rights in the State. To investors who want something certain, and, to last a life time, this ought to prove an acceptahle property.

Brown's mountain, another high ridge, separated from Buckeye hy Rush creek, contains, to all appearance, an equal amouut of auriferous material. Oregon mountain, west of Weaverville, affords also an endless quantity of rich hydraulic land. All of these places have heen worked steadily for more than a quarter of a century, and yielded enormous quantities of gold dust. As yet they have only been scratched on the surface. Their real wealth remains to he gathered. Bnt it now requires money to open, outfit and work them. It also requires men to take hold of them having a little more enterprise, energy and business tact, than is possessed by the old stock of miners, who are content to work away at them after their ancient and easy-going fashion.

Along Trinity river, for a distance of nearly 100 miles, there are still good placer diggings. These consist of the higher hars along that etream which are both rich and extensive, hut as yet have heen hut little worked for want of water. The low hars, from which the dirt could he easily taken to the river to he washed, or upon which ditches could be readily hrougbt, were washed off first, enriching the early crop of miners, many of whom having made their piles left the country, not stopping to huild ditches or make other costly and permanent improvements. As a general thing, it was the lucky ones wbo left and the less fortunate who stayed behind. These latter, having hut little money and many of them having since lost their grip, mining affairs in Trinity hear largely still the impress of primitive times.

During the past few years, however, a good many small ditches have heen constructed, bringing water upon those higher hars from the mountain gulchee adjacent, and in some instancss from the forks of the Trinity or the main river itself; these ditches being huilt sometimes hy old residents, hut oftener hy newcomers attracted to the country hy the many inducements offered here for the prosecution of mining enterprises. On these hars the dirt is rich, and washes readily, and there is alwaye plenty of fall; the gold heing generally coarse and easily eaved. The cost of hringing in water and rigging up works is small here compared with that reqnired in the more southerly counties, the reverse heing true as regards profits realized.

On the lower Trinity this class of mines are, without exception, yielding well, their annual net earnings being at the rate of ahont $5,000, and often as much as $8,000 or $10,000 on every $20,000 invested; the favorahle feature ahont the husiness heing that these earnings are sure and lasting, as the material is plentiful and water always in good supply. At McGillivray's Ranch, Dixon's Bar, Cox's Bar and Taylor's Flat, very profitable operations have heen carried on the past year, and extensive preparations made for thc coming season. At the latter place Archie McDonald, a well-known California and Nevada miner, has inaugurated a large and promising enterprise, and which, if it do not pay like some of the Comstock honanzas, can be always counted on for a fair return. He has got his property in fine shape, and, like many others here, only waits for a little more liheral rainfall to commence active operations on a large scale. The miners have everywhere improved the last dry eeason to get their claims in good condition for winter work, which they have generally succeeded in doing. Some new ditches have heen dug, and the old ones cleaned out. The flumes have heen re-hlocked, and some additional ones laid down; bedrock cuts and tunnels have heen run and all needed repairs made, and with the usual supply of water a hig crop of gold dust will he gathered in Trinity during the incoming year. The quicksilver and vein mining interests are also in a prosperous condition, the Altoona mine turning out monthly about 360 flasks of quicksilver; and the mines about Deadwood, Indiau Creek, Bullychoop and other quartz mining centers yielding satisfactorily. No large ore reducing mills have yet been huilt up that way, much of the quartz heing, in fact, worked with arastras, hut ths business, with hardly an exception, has been made to pay, and is steadily expanding, a very markad progress having heen made in it the past year. While Trinity offers hut a poor field for purely speculative operations, our informant is of the opinion that it presents many good opportunities for the permanent investment of capital, as well as fair chances for working miners who have enough money to give them a start to make good wages.

The Charter Tunnel.

We publish hy request the following article from the Ruhy Hill *Mining Record*. The account is vouched for as authentic:

Few have even a remote idea of the extent of this gigantic enterprise; its ohjects, what mines it will develop, etc. In 1870, Chas. Dehman, well known all over this section as a reliahle gentleman and a good judge of mines, visited Prospect mountain on a prospecting tour. After a deal of tracing all over the surface for a considerable distance, sinking of shafts and making assays, he finally determined to start what is now known as the Charter tunnel. Thie was about the middle of '72, and from that time to the present, work has been going on in this valuahle property. Up to the time of incorporating, 570 feet bad heen run in the main tunnel, hesides thousands of dollars expended in sinking shafts and running drifts on other portions of the company's ground.

The company was organized under the laws of the State of Nevada, and Geo. M. Sahin was elected President; James Sias, Treasurer; E. J. Butler, Secretary and Gen. P. E. Connor, Superintendent; Trustees, Thos. J. Read and Chas. Dehman, aud the officers above named. The capital stock consisted of 100,000 shares of the par value of $100 each, and 25,000 shares were set apart as a workiug capital, 8,000 of which have already heen disposed of, and sales are heing made every day of the residue. Immediately after incorporating, in June, a contract was let to enlarge the tunncl, lay a track the full length of the same and get everything in excellent order for resuming active operations at once. The next contract is for 200 feet, for which the company is paying $7 per foot. The

First 500 Feet

Was run through harren ground, but as it advanced into the mountain good indications were discovered on every side. The surface formatione were passed through and ledge matter could he seen in stratas across the face. It is now in a total length of 600 feet, and several feeders are coming in which show considerahle silver. At the time of our visit a rich strata was struck, ahout four inches wide, and appears to he getting wider rapidly, as the tunnel is advanced. This tunnel runs nearly southeast. There are 2,500 feet of continuous mining ground ahead of this tunnel helonging to the company, and also a large area of patented claims on either side helonging to other parties, which will he prospected hy crosscuts from the tunnel.

State Pride No. 1.

A crosscut run south from the present face of the tunnel would, in a very short distance, tap the ledge in State Pride No. 1 and several other adjacent claims. This claim has heen prospected to a depth of 54 feet from the surface, and 35 feet down a ledge varying from 20 inches to four feet wide, was cut. Assays have heen ohtained as high as $894.

State Pride No. 2.

This is the next claim that will he reached hy the tunnel. A shaft was driven down 85 feet on the ledge. This ledge assays very high, and seems to run parallel with the ledge in No. 1.

Eleven Different Locations.

In the State Pride series there are 11 different locations, covering 800 feet of ground. Shafts were sunk on several, and as they showed every indication of heing regularly defined ledges, from one to four feet in width, it was not deemed necessary to prospect them all, and the tunnel was then started to develop them. These are interlaced with cross ledges which run ohliquely across. The croppings very much resemhle those on Ruby Hill, only a little darker, perhaps. They cannot he termed hlind ledges, for the croppings can he traced on different points on the surface, and on einking a few feet almost auywhere, ledge matter is encountered.

Monogram.

A shaft was sunk down 30 feet, following the ledge, wbich is 20 inches wide all the way. Several other well-defined ledges crop out on the surface near to this one. Assays of $200 have been obtained. A tunnel was run in on one of these ledges, tracing it lengthwise over 40 feet. Assaye of choice samples reached $500.

Parallel Claims.

Between those ahove-mentioned are several parallel claims on which some little work has been done. The tunnel will tap them all hetween 200 and 300 feet below the eurface. These ledges and tbe tunnel seem to he running in the same direction, southeast.

Firefly.

This shows a splendidly defined ledge about five feet wide, lying hetween two different limestone formations. It appears to be a true fissure vein.

Peer.

Lying south of the Firefly, shows a ledge varying in width from 4 to 15 feet. This claim contains only 800 fest, but has a plainly defined ledge.

Andalusia.

This fine prospect is situated hetween the Charter tunnel and the Peer. The ledge is 15 feet wide, and assays from it were very satisfactory. A tunnel was run in 40 feet and two shafts sunk, one 15 and the other 30 feet. The croppings show up holdly.

Plummets Nos. 1, 2 and 3.

The tunnel is in 85 feet, and the ledge is two feet wide at this writing, with a well-defined surface cropping, which is evidently hecoming wider as the work goes ahead. No assays have been had, hut the quartz contains rich argentiferous galena. A contract was recently let to extend thie tunnel 100 feet more, at $6 per foot. A shaft was sunk down 30 feet at another point on this claim.

Premium.

Some very fine ore has been extracted from this prospect, assaying $500, and the ledge is from three to four feet wide.

Premier.

Situated about 300 feet west of the Premium, and running parallel with the latter. A tunnel was run in 50 feet, which tapped a ehaft, also down 50 feet. The ledge is 15 feet wide and well defined.

Altai.

Southeast from the Charter tunnel is the Altai. The ledge appears to run nearly parallel with and ahout 600 feet west from the well-known Grant mine, from which a large amount of rich ore is now heing extracted.

Needle.

A contract was recently let to sink a shaft 100 feet. They are at present taking out some very high-grade ore, picked specimens assaying $1,500 per ton. The ledge is large and well defined. Ten tons that were worked in 1874 averaged, in different lots, from $200 to $500 per ton.

Dehman.

North of the Needle is the Dehman, in which is encountered the same character of ore. The last named locations were made in 1870.

Coronet.

This claim is near the Prospect Mountain tunnel. This shows a contact vein, and runs north and south. Assays show $500 in gold and silver. The shaft is down 184 feet, and a drift on the ledge from the hottom is iu 50 feet. The ledge has an easterly dip.

On the Ruby Hill Lode.

Northeast is the Jacksou, Jefferson and many others, which are thought to be on the Ruhy Hill lode. The Richmond Con. and Eureka Con. mines are to the northwest of these. A little to the east is the Magnet, Industry, El Dorado, Metamoras, Kit Carson, and many other well-known mines, which either at present or in times past have yielded a large amount of rich ore.

Can be Utilized for Eight Miles.

It is 200 feet lower than any other tunnel can be started, and can he utilized in the development of the large number of mines which it will tap in a distance of eight miles. It is already in permanent sulphurets and helow most of the oxidizing influences. The ore will douhtless prove of that permanent character encountered, which, when fouud at all, is at great depths. A tunnel started at this point must necessarily he a great property, even should the company own none of the mines which it is intended to tap, hut in the present case their own ground is rich enough to warrant advancing the same. Some of their ledges have heen followed down for 85 feet, and are distinctly defined hodies.

Thirty Claims Recorded.

The company have nearly 30 claims on record, which are a much greater number than would be required, at present, to cover their ground, hut in early times, when they were taken up, the law required all croppings to be specially located, hence, so many different claims. The

Enormous Mass of Ledge Matter

Seen on every hand is the very hest indication that a little deeper a large body of ore must he uncovered. In the year 1872 the locators had several assays from different claims, the highest of which was $900 and the lowest $20. In 1873 a numher of assays were made, the average of which was $353.

Depth of the Tunnel.

At its greatest depth the tuunel will he over 3,000 feet helow the highest peak of Prospect mountain.

A Valuable Property.

This is certainly one of the most valuahle properties in the camp, and probably in the next 100 feet an ore hody will be developed which will, in size and richness, equal any vein ever found in the camp. With all the good mines around it, it is hut reasonahle to conclude that it must prove a paying investment, and, perhaps, ere long a dividend paying institution. The stock, with the present outlook, is worth at least $5 per share. By the Recorder's hooks we find that nearly all these locations were made in the years 1870-75, at a time when only mines which are of a high grade were considered worth locating. The early date of their location shows that it was not with a speculative view, hut for permanent and legitimate investment.

What About a Free Library.

We have a grand, growing city; a city destined to attain a population and commanding importance commensurats with the growth of our favored western coast. It is time now to lay foundations broad and deep which shall determine the character and quality of the superstructure which shall hs reared upon them. Passing over the important matters of increasing trade, and providing facilities for its transaction in the time when it shall far outstrip its present dimensions, we come at once to the point we would make, aud that is, provision for the iutellectual growth of our people. We speak not of schools, but rather of a grand repository of availahle knowledge, instruction and entertainment which a grand free library shall furnish to our coming hundreds of thousands. Is it not time now that the foundation for this library should be laid, and the enterprise pushed forward with united zeal and combined interest among all friends of the true progress of our pcople? Is there not in this matter a principle aud a promise involved which should lead us to rise above personal feelings, to accept a sacred trust which we owe to the rising generation to execute? Is there not a hroad duty in thie project for a grand free library which all friends of progress should assume.

It seems now that there is a proposition pending, which shall decide the course of the Mechanics' Institute with refereuce to the huilding up of a free library, as authorized hy the last Legislature. If the Institute ehould decide not to ally its interests with the free library movement, will not the latter go forward enthusiastically by others' aid, and will it not he difficult to maintain a list of subscribing memhers when the free library is well in operation? And could not the Institute, by giving over its library enterprise to the trustees of the free library, go forward more rapidly in other works which are in its legitimate sphere? Could it not develop more fully the lyceum features, and thus contribute to the education and high entertainment of the people in a way which is now made of secondary importance? Could it not develop features for the encouragemeut of the fine arts, for the elevation of the mechanic arts, and for the free instruction of apprentices in directions which are not now open to them, but which would elevate their workmanship, their manhood aud their citizenship?

It seems to us that some action of this kind could be taken with advantage to the grand work of the Institute, and as a splendid contrihution to the progress of the free library project. Ont of 11 trustees of the free library, 5 may he appointed hy the Institute, and would not this he ample assuraace that the work which the Institute has already accomplished in its library should not he permitted to fall to the ground, hut would be used as a stepping-stone to still grander achievement for the henefit of the whole people. This is an important matter; we hope wisdom may guide the final determination.

Ore Sluice and Concentrator.

Geo. K. Evans, of San Francisco, is the inventor of an improved ore sluice and concentrator for saving such valuable heavy metals or sulphurets as may he found in the tailings, which escape from mills and other apparatus employed to work ores. It consists of an inclined tahle, with a feed box and water-dietrihuter at one end, and a trap at the other end to catch the sulphurets, whenever the tahle is sufficiently filled. The tailings mixed with water comes on through the feed hox, the hottom of which ie provided with V-shaped hlocks, to distrihute the tailings evenly. They enter upon the table through a narrow, horizontal slit. They spread evenly over the eurface of the tahle. The lighter, worthless particles are carried down to the lower end of the tahle, and the lid of the trap heing shut at this stage of the process, they pass off upon another table helow. After the tahle is sufficiently charged, water is turned on into a V-shaped trough, that is pivoted ahove the tahle near the upper end of the latter, and the length of which is ahont equal to the width of the table. This trough has a very narrow elit at the apex of the V. Within the trough is a flat piece of wood, which serves to distrihute the water equally to all parts of the slit. As said hefore, this trough is pivoted at each end, and when the water is turned on, a crank at one end is gradually turned so that the thin sheet of water coming from the slit in the trough may sweep the whole tahle from the top to the hottom. Immediately after the water is turned on, the lid of the trap at the lower end of the tahle is let down, so that the "pay," swspt hy the eheet of water, is carried into the trap and thus saved. No blankets and no copper platee are necessary, and comparatively little water is used. The tables may he arranged one helow another, so that what little is lost hy one above may have an opportunity to he caught hy the next helow, and so on. The machine has heen tested in eastern Nevada, and with very satisfactory results. Patented through the Mining and Scientific Press Patent Agency.

A Convention of leading military officers of the different States will he held at New York in Jauuary, to take action looking to a national organization.

Academy of Sciences.

A regular meeting was held on Monday, Dec. 16th, President Davidson in the chair. Among the contributions to the cabinet were the following: Seventeen specimens from the mine of the Pacific Paint mining company, of Los Angeles county, presented by Jean Jay, President of the company. Tin ore from New Mexico, and silver ore showing filiform silver, presented by John Hewston, Jr. Specimens of sandstone, serpentine, indurated sandstone and blue rock from outcrops and from wells in San Francisco, presented by C. D. Gibbes. Specimens of cement gravel, shells and blue clay, taken from a depth of about 300 feet in wells bored in San Francisco bay by Morgan & Co.

Hon. Alex. Del Mar read a paper on the "Evolution of Words." He considered particularly the words "civilization," "money," and "value." His remarks on the "value" were exceedingly interesting. "Value," he said, "had always been the

"Ghost in Political Economy.

"Economists have talked all around the subject, but have never succeeded in talking at it. They have always ended by stating what 'value' arises from, but never what it is." He disagreed even with the latest school of economists, of which Macleod in England, and Perry in America, are representative men. In fact, as the whole of political economy turns upon the conception of "value," Mr. Del Mar may claim to be the founder of a new school. We hope at some future time to present this part of the paper in full.

Mr. Del Mar was followed by Prof. Price, who read a paper on

Arteslan Wells,

Prepared by C. D. Gibbes, C. E. This paper also we will present more fully in a few weeks. The writer considered the wells of San Francisco, devoting most of his time to those of the Van Ness basin, presenting drawings of the latter, and also of the outcrop of sandstone and serpentine in the neighborhood. He next took up the wells bored in San Francisco bay under the direction of Morgan & Co., the oyster raisers. The most interesting part of the paper was that descriptive of a section presenting the country from San Francisco east through Mt. Diablo and Stockton to the foothills of the Sierra Nevadas. The section showed the Stockton well, and also that upon the Norris grant. The latter is now about 2,120 feet deep. The question as to whether deep borings in San Francisco will succeed in striking water from the Sierra Nevadas, was discussed. Mr. Gibbes' conclusion was that no such water can be struck in San Francisco. However, we do not think that his arguments were at all conclusive. He had no data whatever to prove that deep-lying strata, having their outcrop in the Sierras, do not pass under us to the ocean. And such strata might be so bent and tilted to be much nearer the surface at San Francisco than they are at the Norris grant, and at the same time sufficiently regular to hold water. This is of course mere theorizing, with no facts to back it; but at any rate Mr. Gibbes presented no facts to the contrary.

After the paper was read, the subject was discussed at some length by the members. Dr. Harkness gave further facts concerning the Norris well. The water changes in bight quite frequently, the level varying as much as 36 to 50 feet. Several layers of wood have been passed through and illuminating gas has been struck. Prof. Davidson spoke of the change in level in wells near tide water. He thought it due to the increase and decrease of pressure on flexible strata. When it was questioned whether the small rise of tide, in San Francisco bay for instance, could affect strata at depths of 200 feet or more, Prof. Davidson cited the instance of the tilting of the hill on which Greenwhich stands, in support of his opinion. Every 24 hours the hill rises and falls, an extremely minute distance of course, but sufficient to be detected by delicate instruments. Prof. Davidson though it due to the rise and fall in the Thames. Prof. Thos. Price reported his analyses of water from San Francisco wells, that from the Van Ness basin was characterized by a large percentage of calcareous matter. That from the lower portion of the city contained more magnesia, indicating that it washed upon the underlying serpentine. The difference in the waters from the two localities proved that they were in separate basins, and did not come into contact with each other. One remark of very great importance was made by Prof. Price, viz: that the water was noticeably free from all sewage matter. Dr. Gibbons seemingly contradicted this. He believed that sooner or later the water *must* be contaminated with sewage, as there were no truly artesian wells in San Francisco, all of them being supplies by drainage from the immediate locality.

After the discussion the nominations of officers for the ensuing year, were accepted from the committee. With the exception of S. B. Christy, corresponding secretary, the officers will be the same as at present. A eulogy on the late D. D. Colton, trustee of the society, was read, and resolutions of esteem and sorrow were accepted.

The meeting adjourned, the session having been a very interesting one.

Useful Information.

Glass Gilding.

A new process by M. Dodon, is thus given by the *Moniteur de la Ceramique:*

Gold, chemically pure, is dissolved in aqua regia (one part nitric and three parts hydrochloric acid). The solution effected, the excess of acids is evaporated on a water-bath, till crystallization of the chloride of gold takes place; it is then taken off and diluted with distilled water of such quantity as to make a solution containing 1 gram of gold to 200 cubic centimeters of liquid; a solution of caustic soda is then added until the liquid exhibits an alkaline reaction. The solution of gold is now ready for reduction. As a reducing agent, an alcoholic solution of common illuminating gas is used. This is prepared by simply attaching a rubber tube to a gas-jet and passing the current of gas for about an hour through a quart of alcohol. This liquid (which should be kept in a closed vessel) is added in quantities of from two to three cubic centimeters to 200 cubic centimetere of the alkaline solution of gold before mentioned; the liquid soon begins to turn to a dark green color, and at length produces the metallic layer of gold of known reflecting power.

If the gold employed ie an alloy, the foreign metals must in all cases be first removed; and especially the least traces of silver, because the very smallest quantity of this metal totally prevents the regular and uniform deposition of the gold.

The bath thue once prepared, it is proposed as a method of gilding mirrors, and also for all the articles of various branches of industry where this process of gilding could be used with success and to advantage.

Felling Trees by Electricity.—The destructive effect of a stroke of lightning upon a tree has led an ingenious gentlemen in India to test the value of artificial electricity in cutting down trees. The two ends of the copper wires of a galvanic battery were connected with platinum wire, which of course became instantly red-hot, and was then passed backward and forward across the trunk of the tree to be felled. Unfortunately the platinum wire at hand was too fine for the purpose, and was consumed long before the work was accomplished. But the tree was sawn one-fifth through, and there seems to be no reason to doubt that with larger wire and a battery of suitable strength the axe and saw may find a formidable rival in electricity. It is calculated that a tree which requires two hours to fell with an ax may be brought down in 15 minutes by the new process, and that without sawdust or waste of wood in chips. A patent for this mode of felling trees was taken out in this country some two or three years since; but we have had to wait for the "ingenious gentleman in India" for the first effort at a practical method.

Warning to Locomotive Engineers.—Drs. Charles M. Cresson and Robert E. Rogers, of this city, says the Philadelphia *Ledger*, well known as experts in chemistry and dynamics, were appointed by the Reading railroad company to inquire into and report upon the causes of the recent explosion of the boiler of the express locomotive "Gem," at Mahoney City, by which five lives were lost. Their report, which is designed to cover the whole scope of a most careful investigation, is not yet made public, but they have arrived at the following specific conclusion, which we give in their own language: "We are, therefore, of the opinion that the explosion of the boiler of the locomotive 'Gem,' was produced by the projection of foam upon the heated crown bars of the furnace, caused by suddenly and widely opening the safety valve, at a time when the water had been permitted to get so low as to overheat the crown of the furnace." This is an important matter that should be carefully noted by locomotive and other engineers.

Just So.—A man in Fulton, N. Y., recently laid his finger on the table in front of a buzz saw to feel the momentum of the air. The saw was going so fast that the teeth were not to be seen. His finger was taken off. While he was looking at it the foreman came up with the question: "How did you do it?" "Why, I put my finger down so," answered he, placing the other forefinger, as he thought, well away from the teeth. To his horror, the saw took off that one, too, at the second joint.

Folding Fans were invented A. D. 670. The fan which opens and shuts is a distinct unchallenged Japanese production, the model being a bat's wing. So various are its uses in Japan for artistic decoration, in etiquette, in war, in peace, in literature, and in ways unknown in other countries, that Japan has been called the "fan country."

The Luminous Clock-dial.—The inventor of the luminous clock-dials, of which so much has been itemized in the newspapers, appears to be W. H. Balmain, and his secret consists in mixing a phosphorescent salt with paints and varnishes, which will store up light during daylight, and give it out at night. He uses a mixture of lime and sulphur.

Steam as a Light Reflector.

As everything pertaining to the improvement of the methods and paraphernalia of illumination is at the present time looked upon with special interest, we reproduce, for the benefit of our readers, an account of a recent patent granted in Germany to Herr L. Brandau, of Berlin, in which he proposes to utilize the emissive properties of steam for illuminating purposes. In describing his plan, the patentee refers to the fact that steam in condensing forms dense white vapors, which possess the property, when exposed to an intense source of light, of partly reflecting and partly absorbing and subsequently emitting it, as the clouds behave toward the sunlight, diffusing a mild and uniform brightness. In adapting his system to overhead and side lights, Herr Brandau employs an apparatus consisting essentially of a glass chamber, into which steam is admitted, a passage way for its exit being also provided. This is then either illuminated directly, or with the aid of mirrors, by the source of light.

Novel as it may seem, the plan appears to us to have decided merit, and it is not impossible that the idea of Herr Brandau may contain in it the elements necessary for the successful moderation and diffusion of the blinding brilliancy of the electric light, which has in most situations proved to be a serious drawback to its usefulness.

The high absorptive and emissive properties of water vapors, both for heat and light, are well-known physical facts; and the commonplace allusion to the sudden gleam of brightness that follows the escape of clouds of steam, especially noticeable when the sunlight is hidden, will serve as a familiar example of a principle that Herr Brandau proposes to turn to useful account.

The Motion of a Wagon Wheel.

The most of our readers will recollect the newspaper discussion, some three years ago, in regard to the relative motions of the upper and lower portions of a wagon wheel. The *Scientific American* thinks the position it took in regard to that question has been fully demonstrated as follows: "The instantaneous photographs of trotting horses, taken by Muybridge, of San Francisco, furnish the first visible demonstration of the much disputed fact that the top of a wagon wheel, when running along the ground, moves faster than the bottom. It is obvious that an instantaneous photograph of a wheel, revolving upon its axle in the air, would show all parts of the wheel with equal distinctness. But if the wheel have a progressive motion, and any one portion has a greater motion than its corresponding part, above or below, there must be a liability to blurring in that part of the picture.

These pictures are taken with so brief an exposure that the horse, though moving at a 2:24 gait, is sharply outlined. The wheels of the driver's sulky, however, have a different tale to tell. The lower third of each wheel is sharp and distinct as if absolutely at rest. Not so with the top, that part of the wheel showing a perceptible movement during the two-thousandth part of a second of the exposure of the plate. The upper ends of the spokes are blurred, and the rim likewise, thus giving a physical demonstration of the truth which mathematics establishes.

Good Health.

The Art of Prolonging Life.

Persons living in marshy districts, says the Baltimore *Underwriter*, who are necessarily exposed to miasmatic exhalations, will find that lime juice mixed with water and taken freely as a beverage, will prove an excellent preventive of malarial fevers. Those who are suffering from intermittents will find that the antiperiodics, which are cheaper than quinine, the great type of the class, will answer as good purpose if taken in the only proper way, that is a full or even heroic does one hour before the expected recurrence of the chill. When distributed throughout the intermission in very small doses their effect is lost, and disappointment follows.

The medical gentlemen who so carefully prepared the tabulated reports of the mortuary experience of the Mutual Life, of New York, have shown in their admirable analysis of the causes of death, that the proportion of loss from consumption has been 19.17% of the total mortality of the company, and 19 per 10,000 annually. Such figures show the immense importance of more effective methods of treatment, and we are glad to observe in the *Medical Record* the details of a treatment that, so far, has been very promising in its results.

The theory of cure is to clear the lungs by a mechanical effort, chiefly by manipulating the muscles of the throat so as to cause more forcible breathing; second, to establish perfect digestion; third, to promote a process of healing the tubercles, so that they shall become chalky or calcified masses; fourth, to compel the patients to take plenty of fresh air, sunlight, and out-door exercise. To secure perfect digestion, a special diet is ordered in each case, and the food is changed as the power of assimilating it improves.

To promote the calcifying of the tubercles, the salts of lime, which are found in most vegetable and animal food, must be supplied in a soluble condition; the theory is that too much heat in ordinary cooking destroys the natural combination of these salts with albumen, and renders them insoluble to a weak digestion. Out-door exercise is regarded as so important that the patients are instructed to go out in rain, snow, dampness, or even night air or dew, the habit thus acquired neutralizing the danger of catching cold from such exposure. Only strong head winds and extreme hot weather need be guarded against. The patients sleep with the windows open, summer and winter.

A Minneapolis physician, whose cinchona recipe for the cure of drunkards recently attracted attention, recommends this highly carbonaceous mixture in the treatment of consumption: One half pound finely cut up beef-steak (fresh); one drachm pulverized charcoal; four ounces pulverized sugar; four ounces rye whisky; one pint boiling water. Mix altogether, let it stand in a cool place over night, and give from one to two teaspoonfuls, liquid and meat, before each meal. The value of this method of supplying a sufficiency of carbon in a form that may be readily appropriated is obvious.

Benefit of Laughing.—Dr. Greene, in his "Problem of Health," says there is not the remotest corner or little inlet of the minute blood-vessels of the human body that does not feel some wavelet from the convulsion occasioned by good, hearty laughter. The life principle, or the central man, is shaken to its innermost depths, sending new tides of life and strength to the surface, thus materially tending to insure good health to the persons who indulge therein. The blood moves more rapidly, and conveys a different impression to all the organs of the body, as it visits them on that particular mystic journey when the man is laughing, from what it does at other times. For this reason every good, hearty laugh in which a person indulges tends to lengthen his life, conveying, as it does, new and distinct stimulus to the vital forces. Doubtless the time will come when physicians, conceding more importance than they now do to the influence of the mind upon the vital forces of the body, will make their prescription more with reference to the mind, and less to drugs for the body; and will, in so doing, find the best and most effective method of producing the required effects upon the patient.

Sanitary Science. — At a recent meeting of the N. Y. Academy of Sciences, an interesting discussion was held on Sanitary Science, in which Dr. Minor attributed disease to what Richardson calls "ultra-microscopic molecular aggregates," which always exist in the air, but take hold of us only when our vitality is reduced to a certain point. It has been shown that decay is absolutely impossible in vessels from which they are excluded. But for them the earth would now be heaped with the undecomposed remains of animals and vegetables. According to this view, the future efforts of sanitary science must be simply in the direction of learning how to protect ourselves against the "ultra-microscopic molecular aggregates." Much can be said in regard to the unhealthy conditions arising from the use of illuminating gas, which not only withdraws from our rooms a large amount of oxygen, but also fills them with noxious products of combustion. Considerable gratification was manifested at the probable avoidance of much of this trouble from the expected introduction of the electric light.

Food too Easily Digested. — The healthy adult requires food which will give the stomach work to do. The stomach requires work as much as the legs or arms. The nutriment of food for such should not be abstracted and ready prepared, as, for instance, it is, in milk, eggs, meat; it is better that the stomach abstract it by the process of digestion from food. With the sick and the young, however, the case is very different. The stomach of a strong man is like a quartz crushing machine, capable of doing vigorous work. That of a dyspeptic is quite different, and may need great care to enable it to do its work at all. Weak stomachs, however, may be trained by slow degrees to do their work well by giving them just the right food, properly chewed, and stopping the expenditure of nerve force in other directions so that the blood may go to it. By such a course half the dyspepsia might be avoided or cured.—*Herald of Health.*

Effect of Quinine on the Hearing.—It is a well-known fact to medical men that there exists a great prejudice among a large number of people against taking quinine, the idea being very prevalent that a prolonged use of it not only affects the hearing, but (to use the common expression) that it "gets into the bones." As regards the former belief, Dr. Roosa, of New York, has recently been collecting and examining the evidence as far as possible, and has come to the conclusion that in some cases there really is a permanent nervous affection of the ear produced which justifies common opinion. Hitherto physicians have generally disbelieved this and ascribed the notion to prejudice.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Whaling Rocket Trial; A Report on the Minerals at Paris; The Geological Section, 401. The Week; What We Have Done; The PRESS for 1879; Almaden Mines—No. 15; 308. Lake District, Mono County, 409
ILLUSTRATIONS.—Improved Hoisting Engine, 401. Map of Lake District, Mono County, 409.
MINING SUMMARY from the various counties of California, Montana, Nevada and Utah, 405-12.
MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 404.
NEWS IN BRIEF on 412 and other pages.
MECHANICAL PROGRESS.—The Structure of Rails as Affecting Accidents; New Method of Heating Tires; Iron vs. Steel Bolts; Device for Cleaving Stone; Pocket Microphone, 403.
SCIENTIFIC PROGRESS.—A New and Startling Contribution to Science; Cleopatra's Needle and Mind Force; Mystery of Perfume; A New Electrical Device; Non-Transparency of Flame; Scientific Skepticism; A Royal Observer; Solidification of Petroleum, 403.
USEFUL INFORMATION.—Glass Gilding; Felling Trees by Electricity; Warning to Locomotive Engineers; Just So; Folding Fans; The Luminous Clock-dial; Steam as a Light Reflector; The Motion of a Wagon Wheel, 407.
GOOD HEALTH.—The Art of Prolonging Life; Benefit of Laughing; Sanitary Science; Food too Easily Digested; Effect of Quinine on the Hearing, 407.
MISCELLANEOUS.—The Artificial Synthesis of Organic Compounds; The Martin White Case; The Elongation of Tree Trunks; Iridescent Glass; Another "Largest" Telescope, 402. Notes on Trinity County; The Charter Tunnel; What About a Free Library; Ore Sluice and Concentrator, 406. Academy of Sciences, 407.

NEW ADVERTISEMENTS.

Assessment Notice—Cherokee Flat Blue Gravel Company; Annual Meeting—California and Oregon Land Company.

The Week.

This week closes a semester that has been very rich in promise for the miuers of the coast. There have been signs throughout the six months past of the increasing interest in our mines, throughout the United States. Eastern capitalists have been advised hy their press, that there was no more promising investments now to be made, than in developing mines. An unusual numher of mining companies have been incorporated in San Francisco, and many in the East. Among those incorporated here, probably a larger percentage have declared it their intention to mine in Mono county, than in any other portion of our State. Nevada claims a goodly numher of new incorporations, hut hardly so many as Arizona. Among the eastern companies, Arizona figures largely, and after her Idaho comes in for a share, and Colorado and Utah are not behind hand. Of this, however, we have not the data to judge. The promise for the future is great. Leadville, Colorado, has made remarkahly rapid advances, and one is very excusahle if sanguine on the suhject of the developments that will be made by the two railroads now pushing towards her. Arizona is to he opened up immediately by one road, and soon hy two or three. The Utah Northern will give the Snake river placers, and Idaho generally, a more convenient highway. And Bodie, too, may soon be connected with the outside world with more vital ties. As these roads grow, the mining world will grow, and we shall have much to think about and do before 1879 is over.

AT the dinner of the New England Society on Forefathers' Day, Evarts, Sherman and Blaine were among the guests.

THE heaviest snow-storm for years occurred at Montreal on the night of the 21st inst.

What We Have Done.

As we bid "Happy New Year" to our friends, and start to carry out our good resolutions, it is fitting for us to glance back over the lahors of the last six months and see what we have tried to do and what we have really accomplished. It is the duty of a conscientious paper to be a leader and a follower—and what conscience dictates, self-interest strongly seconds. The endeavor of a paper must be to direct the minds and the energies of its supporters into new and advantageous channels. None the less must it be to watch the sense of the people and aid them in following the channels that themselves have selected.

In some great moral and material interests we have tried to he leaders. We have continued to uphold the distinction hetween mining as an industry together with its necessary accompaniments, legitimate stock markets—and that cursc to the eommunity, pure and unadulterated stock gamhling. We have endeavored to lay stress upon the truth—for it is a truth—that the tendency to attach too much importance to auy one mining district is a narrow and injurious, though much loved policy. In pursuance of this purpose we have tried to keep our readers informed as to new mining districts, at the same time heing careful, where reports were questionahle, to sift the evidence, before making statements that might lead anyone to hasty or unadvised action. We have given great prominence, in our "Mining Summary," to Mono county and Shasta couuty mines, hecause they have seemed worthy of encouragement. Likewise with the Silverado mines, of Los Angeles county. We have tried to he fair in our judgments and notices of the Snake river placers, and shall continue to do so. The whole circle of our neighhors—Oregon, Washington, Idaho, Montana, Colorado, Utah, Nevada and Arizona—seem to have very cheerful prospects as regards mining. We have watched the feeling among them, and have attempted to rightly indicate it.

In regard to more special interests, we may refer to our work on the mines of Almaden, and on artesian wells. It is important to our quicksilver-producing communities to have in their possession all the experience of the Old World in the mining and working of ores of mercury. A knowledge amoug the people of artesian water supplies, and of methods for ohtaining them, is of great and growing importance.

In our departmeuts of "Mechanical Progress," "Scientific Progress," "Engineering" and "Useful Information," we have kept our readers ahreast with the world at large. Edison has occupied a goodly portion of the popular attention. Our columns have accorded him a proportionately liberal space. Iu our "Correspondence" column we have had useful letters regarding mines and mining, and artesian wells, and many other subjects of general and special interest. We are happy to say that we have made some progress in exciting discussions through our columns. We earnestly urge its coutinuance.

Elsewhere we make promises for the future. May our friends and supporters help us to keep our promises.

The "Press" for 1879.

We will continne in the coming year to endeavor to represent the mining and scientific interests of our coast. The PRESS for 1879 will contain articles of local and general interest on all suhjects that come within our province. We shall make efforts to he of as much practical use to miners as possible. To this end we contemplate a series of articles on mineralogy and hlow-pipe assaying, adapted hoth in style and matter to the every-day needs of the prospector and miner. We have tried to give heretofore the market price of metals. We shall render our list much more useful hy quoting the price of ores of different metals and grades. In the interest of a new and attractive country, we shall present to the people a series of articles on Arizona, giving as far as possihle new information concerning it, derived from reliahle sources. On the second Saturday of January we will puhlish a supplement, in which will he found a most interesting article on Sonora, Mexico, accompanied by a map. Also a very fully illustrated article on "Artesian Wells," lately read hefore the Academy of Sciences, by C. S. Gihhes, C. E. Among the illustrations is a section of the country made through San Francisco, Mount Diahlo and Stockton to the foothills of the Sierra Nevadas. This will deserve special attention, not only from those who are seeking artesian water in the neighborhood of the regions treated of, hut also from all interested in any way with artesian well supplies in general. In the line of purer science we can promise a paper hy the Hon. Alex. Del Mar, entitled "The Evolution of Words," heing really an addition to political economy.

By pursuing a policy of this kind in selecting matter for our readers, we hope to satisfy the wants of practical, every-day work, and at the same time the desire for higher culture which is the honor of Americans.

Mines and Works of Almaden.—No. 15.

[Translated for the PRESS from "ANNALES DES MINES."]

One sees that the special expense of metallurgical treatment forms hut a small part of the total expenses, and that a considerahle sum should he reckoned for the filling up with details. The annual production is usually from 32,000 to 36,000 frascos of mereury. Each hottle costs ahout six francs, and hence there should he allowed ordinarily 192,000 to 216,000 francs a year for the purchase of hottles alone.

It is this which explains that in the last five years the total expenses of the works for distillation have heen:

	francs.
In 1870-71	386,310.54
" 1871-72	395,800.64
" 1872-73	258,449.62
" 1873-74	278,205.55
" 1874-75	417,102.35

For the following quantities of ore treated and of mercury produced:

Years.	Ore Treated.	Mercury Produced.
1870-71	15,867 tons.	1,185.007 tons.
1871-72	15,835 "	1,135.045 "
1872-73	16,094 "	1,155.280 "
1873-74	16,379 "	976.104 "
1874-75	18,815 "	1,264.355 "

This gives for the ton of mercury produced the following costs:

1870-71	325.90 francs
1871-72	348.40 "
1872-73	228.70 "
1873-74	285.00 "
1874-75	329.90 "

And per ton of ore treated:

1870-71	24.35 francs.
1871-72	24.97 "
1872-73	16.07 "
1873-74	16.98 "
1874-75	22.17 "

In resume, the expenses of all kinds, particularly at the works, may he ascertained from the following figures:

	Per ton of Mercury.
Special expenses of distillation	45 to 60 francs.
Bottling and costs of bottles	170 to 180 "
Repairs (sorting of ores, etc., etc.)	50 to 100 "
	265 to 340 francs.

In order to ascertain the cost per ton of mercury, in order to fix its selling price, add the general expenses of the administration and the cost of extracting the ore.

The cost of exploitation per ton of ore varies hetween 50 and 60 francs. At present, owing to the augmentation of the production of the mines, during the last few years, and ahove all, owing to the considerahle improvements in the arrangements for working the mine, the price tends towards the first figure, 50 francs; we will take 55 francs as the cost of a ton of ore, rendering 7% to 7.50% of mercury.

The general expenses of the direction and the whole of the establishments of Almaden, naturally reach a considerahle sum, and it is a rather small quantity of mercury which should support them. They increase the expenses of a ton of metal as follows:

Nature of the Expenses.	1870-71	1871-72	1872-73	1873-74	1874-75
	Francs	Francs	Francs	Francs	Francs.
Personal.....	109.90	114.60	100.60	128.00	105.50
Expense of office	4.20	4.40	4.20	4.20	3.60
Shops.....	13.00	14.10	25.60	32.10	23.00
Hospt'l & Chapel	20.90	22.60	16.70	22.10	17.00
Domain of Castilseras.....	17.60	14.60	14.60	17.40	12.70
Sundries.....	0.30	0.20	1.50	1.50	0.00
	166.50	170.20	172.20	204.60	161.80

Thus the price of a ton of ore, comprehending all the expenses, oscillates hetween the following figures:

General expenses	160 to 700 francs.
Ore	700 to 900 "
Distillation	45 to 60 "
Bottling	170 to 180 "
Repairs	50 to 100 "
	1,125 to 1,440 francs.

See, also, for the variations in the price, the able placed at the end of the present work.

III. Losses of Treatment.

On account of the high value of mercury, the essential element upon which to fonnd a judgment of this or that metallurgical process is not the general expense of treatment, which may he a little greater or less in any special case; these expenses are always very small in comparison with the value created, or at least in the case of a rich ore like that of Almaden. The loss of the mercury contained has an importance much greater. We have said that the ton of ore contains ou an average 8.30% of metal, (83 kilograms consequently), while the yield is 78.4 kilograms. If now the loss rises only as high as 10% of the mercury contained, it will not yield more than 74.7 kilograms, and the cost of extracting a ton of mercury will increase consequently in the ratio of 78.4 to 74.7; in place of being on average of from 1,200 to 1,400 francs, it will be from 1,259 to 1,469 francs; the increase will therefore he greater than the expense of the distillation, properly speaking.

The metallurgy of mercury at Almaden is very far, according to this ratio, from presenting the inferiority which is generally attrihuted to it hy the opinions of many authors whose assertions have heen everywhere repeated without reservation. These assertions have heen wanting in foundation; there were taken it is true a great number of assays in order to arrive at a determination of the richness of the ore, but they never seem to have proceeded in such a manner that the value of the assay might represent with the least degree of certainty the value of a heap of ore which was required. It is well known with what facility a chemist or an engineer little experienced in this altogether speeial operation of taking samples, will allow himself to select from a heap of ore the pieces especially rich; comparative results can he ohtained only by the use of all the precautions taken at Swansea or at Freihurg, which consist in a thorough mixing of the heap, the division of the heap into several others, and a series of such divisions systematically arranged.

They had, therefore, arrived by an extremely defective method, at a conclusion absolutely false, that the ore of Almaden contained on an average 14% of mercury; and as they neither weighed the ore charged into the furnace nor the slag taken from it when the roasting was finished, the control was very nearly impossihle. They were consequently forced to come to the conclusion that they lost in the treatment at least 30% to 40% of the mercury contained; M. M. Feruando Bernaldez and Ramon Rua Figueroa, in a memoir printed in 1861, by a royal order, declared that the loss was 53.40% of the mercury contained in the case of the Idria furnace and 49.82% in the case of the Bustamente. Other engineers, as M. Salazar, admitted the figure quite as arhitrary of 30%, from analogy with the results known at Idria.

They regarded as not less incontestihle, that the loss should be a little greater in the case of the furnace with aludels than in that of the one with condensation chambers; the latter in other words heing more recent should be the more preferahle. A long series of experimeuts seems certainly to show that there was nothing in this, and to indicate a small superiority in favor of the old furnace. The figures of M. M. Bernaldez and Rua Figueroa, without any absolute value it is true, have assuredly some value relatively.

Admitting a loss of 30% to 50% of mercury, let us see by what defects of apparatus they pretended to explain this loss:

1st. The furnace, properly speaking. The chimney placed above the *atizadero*, hy which the products of combustion, etc., should escape, created an inverse draft, which forced the mercurial vapors through the aludels or the condensation chambers; it may happen that the vapors should he drawn into the fire and he lost up the chimney in front of the furnace. The grate of bricks, and the bed of poor ore which is placed upon this grate, does not suffice always to prevent the falling of fragments of the ore iuto the fire. The walls of the furnace are not impermeahle.

2d. The aludels form a condnit, hadly jointed, although luted; their walls, although thin, are bad conductors of heat, and cool hadly in contact with the exterior air, so that condensation takes place in them very poorly. These aludels, exposed to all the inclemency of the weather and to frequent variations of temperature, break easily, or at least crack during the operation, and give rise to leakage.

3d. The condensation is not terminated when the vapors escape from the chimney; the latter are credited with dispersing in the atmosphere torrents of gas, which contain an enormous quantity of mercnry.

All these ohservatious are not assuredly deficient of all foundation; but they have much exaggerated the influence of these little defects. In fact, the draft of the Bustameute, as well as the Idria furnace, maintains itself with great regularity; the return of the vapors into the fire, and their escape hy the chimney or hy the charging door is an accidental fact, and assuredly very rare. The fall of the ore into the fire is no longer possible; it might, without doubt, have some importance if the ore was in dust, or friable, hut it is never so.

The non-impermeability of the joints of the aludels is less great than it is claimed; hesides, nothing could he more easy, if the joints were really the cause of a considerahle loss, to remedy it hy a more careful lutiug. The rupture of the aludels during the operations is also rare. If one of them is hroken, it is nearly always during the operation of cleaning them, and then their contents are not lost.

[To be Continued.]

TRANSMUTATION OF THE METALS.—In another column will he noticed an article, headed "A New and Startling Contribution to Science." Quotations are made from Lockyer, and, if a daily newspaper may he mentioned in the same hreath with that great scientist—from the London *News*, relating to experiments performed hy Lockyer with a view to proving that the elements of modern chemistry are really compound hodies. At some future time we will puhlish the true state of the case; and will say here merely, that the *News'* report was a sensational one, Lockyer having denied nearly, if not quite all, that that journal says regarding his experiments.

"HANDSOME ANTLERS."—We have received a handsome present, with the compliments of the season, from J. R. Peck, of Healdsburg, Sonoma county, consisting of a neatly mounted pair of antlers, which will serve as an ornament. We only regret that we were not with Mr. Peck when that huck was dropped and quartered.

THE Ameer has backed out of the war. He leaves his son to settle affairs witb England.

THE funeral services of the late Bayard Taylor took place in Berlin on Dec. 22d.

Lake District, Mono County.

From an interview with Judge J. D. Thompson, who is interested in Lake district, we gain the following information concerning that part of Mono county, in this State. The diagram accompanying this will show the location of the principal mines of the district:

The Lake district is situated in Mono county, some 50 miles southeast of Bodie and 25 miles south of the southern portion of Lake Mono, on the east side of the Sierra Nevada mountains, and but a few miles from the head waters of the north fork of the San Joaquin river, and about 80 miles north from Borden, on the Southern Pacific railroad, easy of access by wagon from Bodie or Benton, and by wagon road and trail from Borden.

This district is now attracting a large amount of attention from mining men and capitalists, and bids fair to become one of the most profitable sections for investment in mining at present known. The work that has been done in the district since the spring opened has been exceedingly satisfactory to those who have engaged in developing it. Veins of ore already uncovered prove not only its richness, but go far to prove its permanency.

The ledges are wide and bear ore of uniform quality, though thus far not of high grade, yet sufficiently rich to pay well.

The extensive bodies of fine timber and numerous water-powers reduce the cost of mining and milling the ore, so that there can be no doubt of its being highly remunerative.

The principal mines shown by the accompanying sketch are located on Mineral hill, a table mountain situated in the midst of, and nearly surrounded by volcanic mountains and extinct craters. Mineral Hill is some 7,500 feet in length, and about 2,000 feet in width at the top, the north end and the sides being very abrupt and precipitous; the hight at the north end and on the west side is about 1,000 feet, while on the east the valley extends close to the base, and lies nearly or quite 1,500 feet below the summit. Running lengthwise, and nearly through the center of this mountain, 38° east of south and almost parallel with its sides, is the ledge known as the Mammoth ledge, on which are the Mammoth and Head-Light mines, owned and worked by the Mammoth G. & S. M. Co., of this city. It is 25 feet in width, and has been prospected at different points for 6,000 feet along the ledge. From 600 to 800 feet east of this, and nearly parallel with it, is the Silveropolis, or Don Quixote ledge, which shows equally as rich as the Mammoth ledge, though only about half as wide. Still to the east, and below the summit, is the Monumental ledge. On the west side of the mountain, and partly down the side, is the Crescent ledge; and to the north, and still lower down the mountain side, is the Alpha ledge.

These ledges all bear a uniform quality of quartz and ore, and in every instance have improved in richness as they have been worked. Assays from different mines show the ore to be free milling ore one-third gold and two-thirds silver, and give a general average of from $40 to $50 per ton.

The Mammoth mine is now being worked at the end of the ledge on the north end of the mountain some 200 feet below the croppings, the ore without selecting milling over $40 per ton, the last run of 200 tons yielding $11,000 at an expense for mining and milling of less than $5 per ton. Adjacent to the Head-Light and on the same ledge, is the Monte Cristo, a mine that bids fair to be a rival of the Mammoth in richness. It has two shafts down 40 feet on side of the ledge, but no crosscutting done.

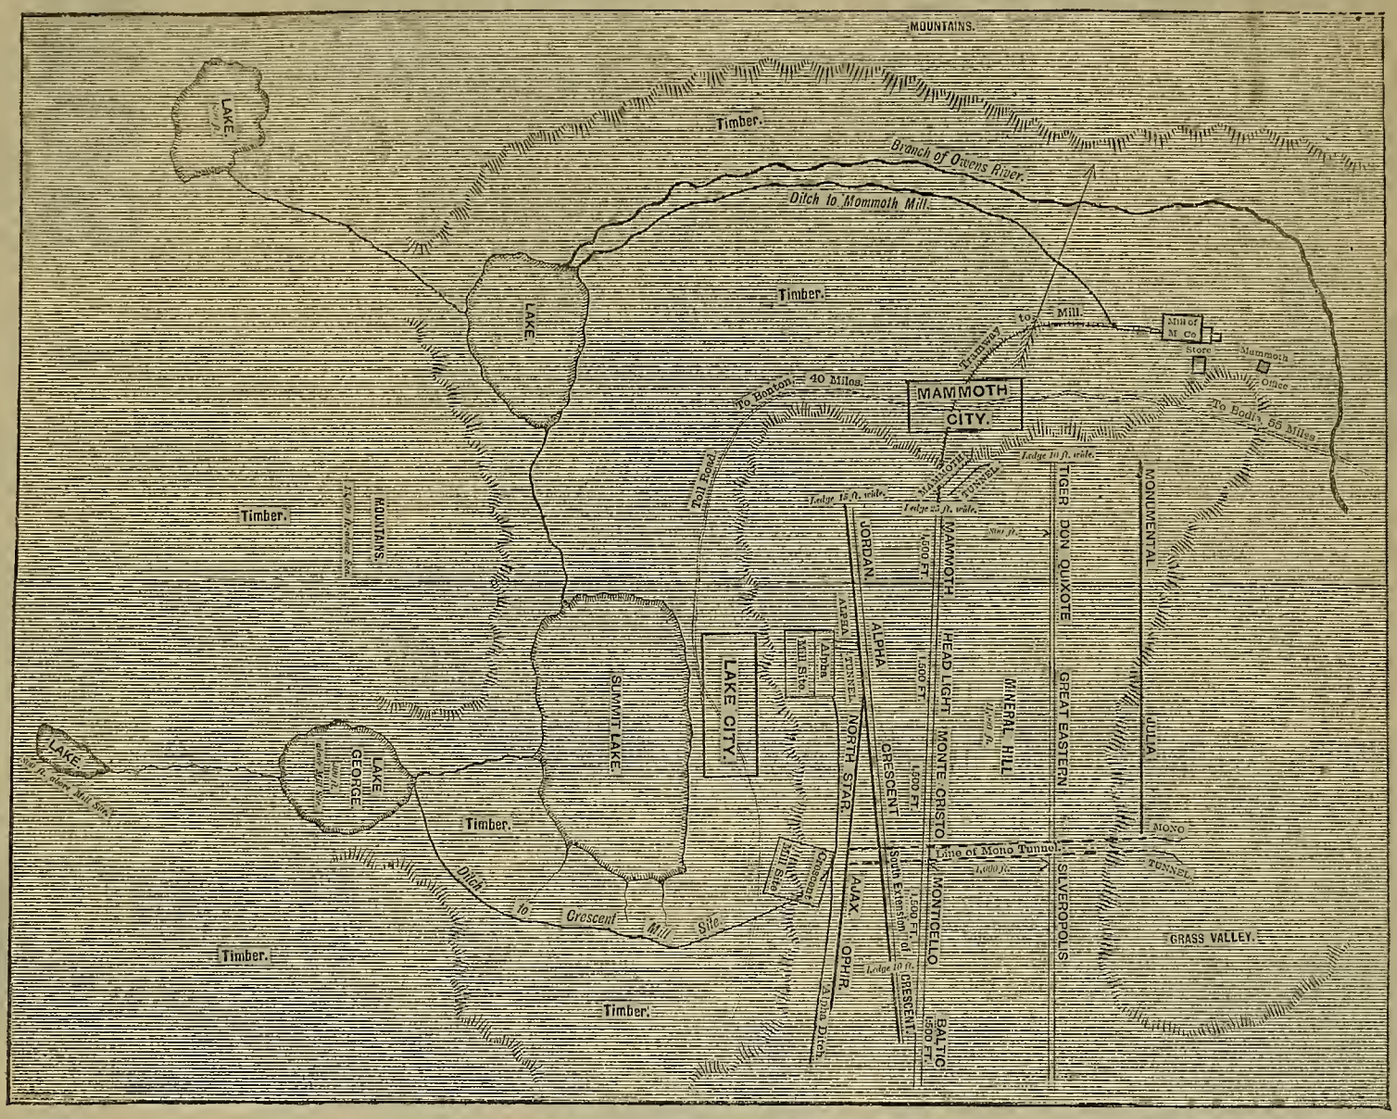
On the Alpha ledge the mine most developed is the Alpha. It has a tunnel in nearly 300 feet and is now within 20 feet of the main ledge, whose croppings 15 feet in width, give great promise of rich ore at the depth the tunnel will cut the ledge. It has already passed through three ledges of low grade ore of from two and one-half to six feet in width, with streaks of very rich quality, assaying up in the hundreds. Adjacent to this on the north is the Jordan, and on the south the North Star, both mines of great promise.

The Crescent is being worked from the side of the mountain, and though not yet into the main ledge, has cut many wide stringers of fine ore, and gives promise of being a valuable mine. Assays from the croppings, which are from eight to ten feet wide, and from the feeders cut, range from $40 to $300 per ton.

Recent developments in the Don Quixote prove that to be entitled to rank with the leading mines of the district, while the Silveropolis on the south end is equally as promising. The Julia, on the extreme east side of the mountain, has also fair prospects. The shape of the mountain and the position of the ledges in it, will enable them to be worked advantageously. The tunnel now being run by the Mammoth Co., will strike that ledge at a distance of less than 600 feet, 1,000 feet below the surface; while the Mono tunnel on the east side of the mountain, will, when extended from that side 800 feet, cut the Silveropolis ledge 1,200 feet below, and worked from the west, will, at a distance of 400 feet, cut the Crescent ledge, and when extended 400 more, will cut the Monte Cristo 1,000 feet below the surface.

The Mammoth has a fine mill of 20 stamps run by water-power supplied by water from the lakes hundreds of feet above it. The Alpha has a mill site at the mouth of the tunnel, and an abundance of water already brought to it sufficient to run a mill of the same size, and the Crescent has water-power of equal capacity; other mines also have water-rights. These are inexhaustible, supplied as they are by large springs, and from the numerous lakes, 12 in number, surrounding the mines, situated among the mountains many hundred feet above the mill sites and conveniently located to be utilized without great expense.

With these advantages over other districts, there can be little doubt but that in the near future those who have invested in Lake district, will be richly remunerated for their time, labor, and capital.



MAP OF LAKE DISTRICT, MONO COUNTY, CALIFORNIA.

Colton Marble.

The Los Angeles *Express* speaking of this marble says: Henry G. Hanks, President of the State Geological Society, has made a study of the Colton marble. He concludes that it compares in every way with the best Carrara marble. The total consumption per year of Carrara marble is on an average of 30,000 tons. Mr. Hanks asks why California should not be able to take some of this to market. He closes his letter to the *Express* as follows: "The flimsy buildings we are now constructing will surely be replaced by those built of better and more durable materials. The wood which has been so abundant, so easy to get, and so easy to work, will be exhausted, or will have to be brought from greater distances, and as the State grows older the people will see the folly of building redwood palaces which cannot by any possibility last more than 25 to 30 years. As this will come about in time, it will be well for us to encourage the prospectors who are roaming over the hills to look for these materials, and to publish the results of their discoveries for the benefit of our citizens. In this connection I desire to mention again the importance of a State Museum at San Francisco, where specimens from such discoveries may be kept for all time—for the benefit not only of ourselves, but for the advantage of foreign visitors who wish to know the resources of the State." On this latter point we beg to suggest that the University is the place for such museum. Berkeley is very accessible from San Francisco, and we have there the men capable of exhibiting the collection to its best advantage; and there, at the same time, our young men may profit from it, as well as the State at large through information given visitors.

Another Long Tunnel.—We learn from the Nevada county papers that the Derbec Gravel M. Co. contemplate running a tunnel into their claim, at a point above the town of North Bloomfield, and working it upon the plan of the Bald Mountain claim, in Sierra county, drawing the gravel to the mouth of the tunnel by locomotive power. The tunnel will be between 3,000 and 4,000 feet in length. If this plan is adopted, both the ground of the Derbec and Watt gravel companies can be worked through the same tunnel.

Kendall's one-stamp mill is said to be more than a success with those who understand how to work it. It was promised that the mill would crush five tons per day. It has been found capable of crushing seven.

A Government financial clerk drew about $10,000 the other day, for salaries. He *lost* the amount. It has since been returned on "no questions" conditions.

One of the school scandal witnesses has gone to Honolulu. A delinquent witness has been bound to appear before the committee.

One Maudle, a naturalized American, has been prohibited from lecturing in Berlin on the improved prospects of our Western States.

Governor Stanford is importing 20 thorough-bred mares from Lexington, Ky.

Reports of dreaded socialistic movements in Germany are followed by rumors of Nihilistic uprisings in Russia.

REGISTER YOUR

TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

FRED. M. PATRICK, Manager.

DEFLECTORS,

Or Perkins vs. Hoskin.

W. H. PERKINS has for nearly two years been threatening orally and through the Press to prosecute all persons using my Patent Deflecting Nozzle, but for *good reasons*, has failed to come to time. I want miners to understand that Deflectors are still manufactured and sold, and that I will defend all suits and assume all responsibility. Mr. P. will confer a favor if he will carry out his threat, as it will afford me the opportunity I desire to again try the case, and be can rest assured that *professional dodges* will not again be allowed to *temporarily* thwart the ends of justice.

I feel confident that the Supreme Court of the United States will ultimately decide in my favor. The superiority of my invention is shown by the means which Mr. P has resorted to in trying to stop my sales. Mr. P. has so degraded himself as to circulate statements which he knows to be *false and malicious*. Notwithstanding the great number of my Deflectors in use, I have heard of but one accident, and this was caused by the breaking of the iron lever from a defect in the material and great carelessness in use. This circumstance Mr. P. has magnified into several deaths and numerous accidents. I refer to the following owners and Managers for testimonials as to safety and efficiency. Some of them have used and discarded Mr. Perkins' device in favor of my much superior one. Messrs. Gould, Gold Run, using 4; Spaulding, Dutch Flat, on different mines, 12; Stone, Gold Run, 2; Morgan, Little York, 6. Bishee, Iowa Hill, 2; Briere & Wheeler, Bath, 2; Mr. Gillvary, Forest Hill, 4; Atkins, Weaverville, 2. I could mention scores of others, but these are sufficient.

Mr. Perkins' device is an infringement on a patent owned by Mr. Craig, who is about to institute legal proceedings to protect his rights. Miners are advised to stand from under. A word to the wise is sufficient. R. HOSKIN,

Manufacturer of Machines for Hydraulic Mining. Address, No. 29 Garden Street, San Francisco, or Empire Foundry, Marysville, Cal.

BELTING AND LACING.

MANUFACTURED BY

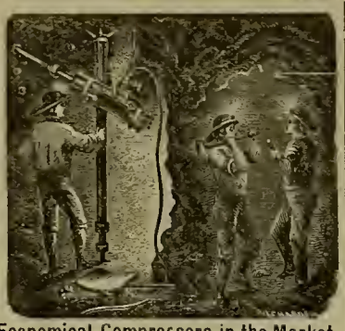
Messrs. Dewey & Co.—*Gentlemen:* I received the Letters Patent for my invention on the 5th inst., and beg to thank you for the gentlemanly and business-like manner in which you have dealt with me from the beginning of my application. I shall always feel it a pleasure to recommend you to all I come in contact with who need Letters Patent. Respectfully, Wm. Dale.

Ingersoll Rock Drills.



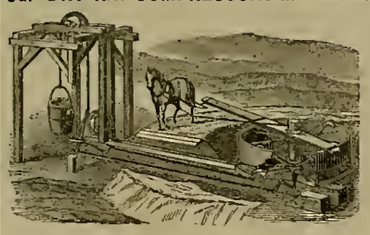
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

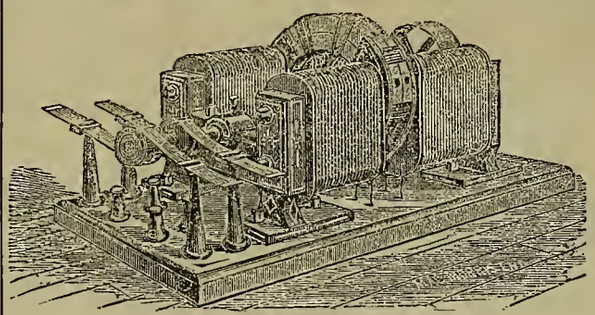
REYNOLDS, RIX & CO., 18 & 20 Fremont St., San Francisco.

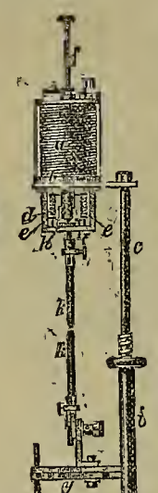
ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

In daily use at the Palace Hotel and the Union Iron Works, S. F.





For Lighting Mines, Factories, Mills, Streets, Theaters, Public Halls, Etc., It has no Equal, either for Brilliancy or Cheapness.

For further particulars, Catalogues, Prices, Etc., apply to

WILLIAM KERR,
President S. F. Telegraph Supply Co.,
903 Battery St., San Francisco.

Elephant Ore Stamp.

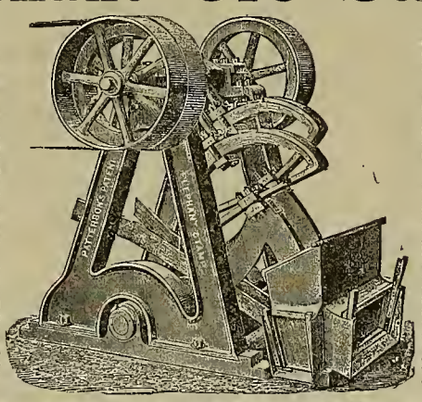
We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

Capabilities.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

Wear.—The 'Elephant' having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thoroughbrace, uniting the lever with the spring, would only require replacing at most, once a year.

Power.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

Portability.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the Machine weighs more than 1,200 pounds, the handling of the Machine is comparatively easy, and in places where it would be necessary to pack the Machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.



The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order. The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main street, near Harrison, San Francisco. For particulars apply to

EDMUND WHITE, Care of A. B. Grogan, 705 Sansome Street, San Francisco.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,
North Bloomfield, Nevada Co., Cal., October 1st, 1878.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the Mining and Scientific Press, San Francisco, at favorable rates. Send stamp for our circular and samples.

Chew Jackson's Best Sweet Navy Tobacco

Life Insurance.

It is probable that at this present time the doctrine of co-operation, which is at the root of human progress, finds its most beneficent illustration in life insurance. The development of insurance in all its forms has been one of the prominent features of this century. We have iusurance against death, against accident, against fire, against shipwreck, against all possible perils and all manner of losses.

We pnt up lightning rods to insure us from the electric holt, and the doctor vaccinates to insure from the danger of a fearful disease. Bnt all forms of insurance are of really trifling value as compared with life insurance. Other insurances can only be looked at from a pecuniary, economical and business point of view. Life insurance occupies a higher and nobler position.

If the property of a citizen is destroyed by fire, and he has no insurance, his energy and industry may in time retrieve the loss; but when death takes away the bread-wiuner from his family, the loss is total and irreparable.

If that fatal day has not been provided for, what follows to a family? What can follow, but unexpected privations—possihly the breaking up of a home, separation, and dependence upon the cold charity of the world.

We hold that no man—no matter how healthy nor how wealthy—who has auy one dependent upon him, has any right to be uninsured. In our speculative country and age, the rich man of to-day may be the poor man of to-morrow, and *vice versa*.

Every reader can recall the name of some acqnaintance, who, insuring when he never deemed his family would need the amount, has died, leaving them the insurance money as their only portion. It has been fashionable of late years to sneer at life insurance companies as mnshroom institutions about on a par with lottery offices, and this has been especially the case on the Pacific coast.

It has happened that almost all of the half dozen companies that since the panic have failed in the Eastern States did a large business on this coast, and consequently our people have beeu extensively suffering; but if these will look at the position of savings banks, railroad, manufacturing and other corporations of the Eastern States, they will notice that the life insurance companies have more successfully weathered the storm than any other moneyed organizations.

The fact is the more business a company did, with currency at 50 cents to 75 cents on the dollar, the worse it was. The funds were loaned on real estate at inflated figures, and when the inevitable period of contraction came, the loss cut both ways, by shrinkage in nominal assets and by paying death losses in currency at par with gold. Under these circumstances the fact that so few companies failed entirely or were obliged to scale their liabilities is the greatest tribute to the inhereut strength of the system. We have one company in our midst that has escaped all such perils. We refer to the Pacific Mutual Life of California. For more thau half a score of years it has dons bnsiness on a solid gold hasis, insuring the lives of our neighhors and friends, paying its death losses promptly and without expense to the beneficiaries, and iuvesting its funds in loans on farming lands, the best of all securities.

The company is now offering a new form of cheap insurances, rnnniug in terms of from 20 to 30 years. This is a form of protection for the most critical period of a man's life, when he is exposed to the vicissitudes of trade and probably has a young and dependent family. It is cheap and meets a want long felt in the business. We believe to-day that if svery farmer and fruit-grower in the land had a policy of insurance upon his life, moderate in amount according to his circumstances, in some thoroughly reliable company, it would be better for himself, his family, and society generally. To all who read this and who think of acting ou it, we cordially and with a full knowledge of its management and resources, recommend the Pacific Mutual Life Insurance Company of California.

W.

Preparations are making for ths rsturn of 100,000 more Russians from Turkey.

There is great suffering among the poorer classes in Europe.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Cherokee Flat Blue Gravel Company.—

Location of principal place of business, San Francisco, California. Location of works, Cherokee Flat, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of December, A. D., 1878, an assessment (No. 40) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 318 Pine street, Room 6, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of January, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the 18th day of February, 1879, to pay the delinquent assessment, togethe with costs of advertising and expenses of sale. By order of the Board of Directors. R. N. VAN BRUNT, Secretary.

Office, 318 Pine Street, Room 6, San Francisco, California.

General Robert Allen Silver Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Globe Mining District, Pinal County, Arizona.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 29th day of October, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

And in accordance with law, and an order of the Board of Directors, made on the 31st day of October, 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the Company, Room 20, Safe Deposit Building, No. 323 Montgomery Street, San Francisco, California, on Monday, the thirtieth (30th) day of December, 1878, at the hour of 12 o'clock M. of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale. OTTO METCHKE, Secretary.

Office, Room 20, Safe Deposit Building, No. 323 Montgomery St., San Francisco, California.

Orion Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of December, 1878, an assessment (No. 1) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 23 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of January, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the 28th day of January, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors. P CONKLIN, Secretary.

Office, No. 23 Sansome St. (up-stairs) San Francisco, Cal.

Summit Mining Company.—Location of principal place of business, San Francisco, California Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of November, A. D., 1878, an assessment, (No. 6,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the sixth (6th) day of January, A. D., 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the fourth day of February, A. D., 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

Mining & Scientific Press Patent Agency.

PATENTS obtained promptly; Caveats filed expeditiously Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing.

The ablest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

The annual meeting of the stockholders of the Peacock Mountain Silver Mining Company will be held at the office of the Company, No. 306 Clay Street, San Francisco, at one o'clock P. M. on Thursday, the 9th day of January, 1879, for the election of a Board of Directors for the ensuing year, and the transaction of such other business as may properly come before the meeting.

ED. B. PARTRIDGE, Secretary.

Office, No. 306 Clay Street, San Francisco, Cal.

ANNUAL MEETING.

The annual meeting of the stockholders of the California and Oregon Land Company, will be held on Tuesday, January 14th, 1879, at 2 o'clock P. M., at the office of the Company, Room 6, No. 318 Pine street, San Francisco, for the election of a Board of Trustees, and the transaction of such other business as may properly come before the meeting. R. N. VAN BRUNT, Acting Sec'y.

Prompt Attention to Business.

AURORA, Nev., Dec. 7th, 1878.

MESSRS. DEWEY & Co., S. F.—*Dear Sirs:*—I acknowledge the receipt of my patent per express this morning, and am obliged for same. I do not know what to say to you regarding your prompt attention to business, but will say to my friends what I cannot say to you. Many thanks is what you will get from Yours truly, C. W. LANE.

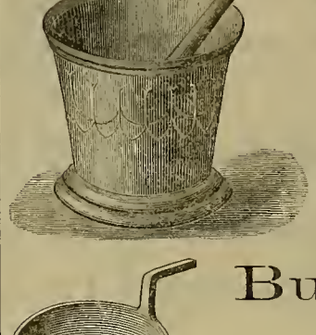
THE NEVADA OVAL TOP RETORT.

The advantage of this Retort over the OLD FLAT PATTERN is, that it can be filled full of Amalgam, thereby holding more than the old style, besides avoiding all danger of an explosion owing to the crown space in the cover which allows for the expansion. They are made extra heavy, WELL GROUND in the joints, and are furnished with a strong Norway clamp, having a wrought iron key which can be driven in or out of place by a single stroke of a hammer.

The Annoying Thumb-Screws are Entirely Done Away With.

We Make Seven Sizes, as follows:

Number or Pints	1	2	3	4	5	6	10
Holds Pounds Quicksilver	12½	25	38	50	63	75	125
Weight each	10lbs	15	18	25	31	44	65



Mortars and Pestles,

GROUND INSIDE.

Size—Quarts	½	1	2	4	6	8	12	16
Hight—Inches	3½	5	6	7½	8½	9	11	12
Weight—Pounds	6½	9	16	22	37	43	72	86

Bullion Ladle.

Forged from one piece of Charcoal Iron, eight inches in diameter by four inches deep.

Send for Circular and Prices.

214 & 216 BEALE St., (rear of Ætna Foundry)

J. V. HALL,

PRACTICAL BOILER MAKER,

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the lowest possible terms.

UNION IRON WORKS,

SACRAMENTO, CAL.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

STEAM ENGINES, BOILERS AND ALL

Kinds of Machinery for Mining Purposes.

Flouring Mills', Saw Mills' and Quartz Mills' Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets,

SACRAMENTO, CAL.

PHELPS

MANUFACTURING COMPANY.

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.

HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,

SAN FRANCISCO, CAL.

Golden State & Miners Iron Works,

Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

WM. H. BIRCH. JOHN ARGALL.

California Machine Works,

BIRCH, ARGALL & CO.,

119 Beale Street, San Francisco.

☞General Mechanical Engineers and Machinists. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturers of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

California Brass Foundry,

No. 125 First Street, Opposite Minna.

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. ☞PRICES MODERATE.☜

J. H. WEEO. V. KINGWELL.

STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

THOMAS THOMPSON. THORNTON THOMPSON.

THOMPSON BROTHERS,

EUREKA FOUNDRY,

129 and 131 Beale St., between Mission and Howard, S. F

MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

GEORGE W. PRESCOTT. IRVING M. SCOTT. H. T. SCOTT.

UNION IRON WORKS.

Office, 61 First St. | Cor. First & Mission Sts., S. F. | P. O. Box, 2128.

BUILDERS OF

Steam, Air and Hydraulic Machinery.

Home Industry.—All Work Tested and Guaranteed.

VERTICAL ENGINES, HORIZONTAL ENGINES, AUTOMATIC CUT-OFF ENGINES, COMPOUND CONDENSING ENGINES, SHAFTING, BABY HOISTS, VENTILATING FANS, ROCK BREAKERS, SELF-FEEDERS, PULLEYS, STAMPS, PANS, SETTLERS, RETORTS, ETC., ETC.

TRY OUR MAKE, CHEAPEST AND BEST IN USE.

Send for Late Circulars. PRESCOTT, SCOTT & CO.

HAWKINS & CANTRELL,

MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE

Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON.

☞ Orders Solicited and Promptly Executed. Office, No. 16 FIRST STREET.

Fulton Iron Works.

Hinckley, Spiers & Hayes.

(ESTABLISHED IN 1855.)

Works, Fremont and Howard Sts. | San Francisco, Cal. | Office, No. 213 Fremont St.

MANUFACTURERS OF

Marine Engines and Boilers,

Propeller Engines either High Pressure or Compound Stern or Side Wheel Engines.

Mining Machinery.

Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

Mill Machinery.

Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores Water Jackets, Etc.

Sugar Machinery.

Crushing Rolls, Clarifiers, Vacuum Pans, Air Pumps, Concentrators, Bag Filters, Charcoal Filters, Blow-up Tanks, Coolers and Receiving Tanks.

Miscellaneous Machinery.

Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Oil Well Retorts, Powder Mill Machinery, Water Wheels.

Engines and Boilers of all kinds, either for use on Steamboats and made in accordance with the Act of Congress regulating the same, or for use on land. Water Pipe, Pump or Air Column, Fish Tanks for Salmon Canneries of every description.

Boiler repairs promptly attended to and at very moderate rates.

PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

Manufacturers of

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING, AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Bailey Air Compressor, Howell's Improved White Furnaces, Walker's Compound Steam Pumps, Etc.

Western Iron Works,

316 and 318 Mission Street, San Francisco,

PERRY EDWARDS, Prop'r.

Manufacturer of Wrought Iron Girders, Trusses, Prison Cells, Iron Roofs, Crest Railings, Finials, Fences, Weathervanes, Gratings, Iron Work for Models, Etc.

Nickel Plated Railings. Bank and Store Fittings. Estimates given and Iron Work furnished for Buildings

---

Dewey & Co { 202 Sansome St. } **Patent Ag'ts** | DRIVING NAILS UNDER WATER.—Stack's illustrated advertisement appears once a month in this paper.

Corner Beale and Howard Sts.,

SAN FRANCISCO, CAL.

W. H. TAYLOR, Pres't. JOSEPH MOORE, Sup't.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstains, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

— AT THE —

Electric Model & Machine Works

Inventors and others can get First-Class Work at Moderate Prices.

After 10 years experience with inventions and other mechanical work, I am fully prepared to execute drawings, working-models and fine machinery of any description to entire satisfaction.

Brass Finishing, Pattern Making, Gear Cutting, Telegraphic and other Electrical Apparatus by competent workmen.

TELEPHONES TO ORDER.

F. W. FULLER, 415 Market Street, San Francisco, Cal.

Main Street Iron Works,

WM. DEACON, PROPRIETOR.

Nos. 131, 133 & 135 Main St., San Francisco.

Stationary and Marine Engines,

Shafting, Pulleys, and General Machine Work. Jobbing and repairing done Promptly and at Lowest Rates. Screw Propellors, Propellor and Steamboat Engines.

SAW MILLS and SAW MILL MACHINERY.

Double C. Reversible. 5½x12, 6x12, 7x12, 8x12, 9x14, 10x14, 7x12, 8x12, 9x14, 10x14

ALL SIZES **Hoisting Engines** FOR SALE BY BERRY & PLACE

Market, head of Front Street, San Francisco.

Steel Castings.

From ¼ to 10,000 lbs. weight, true to pattern, sound and solid, of uncqualed strength, toughness and durability. An invaluable substitute for forgings or cast-iron requiring three-fold strength. Send for circular and price list to

CHESTER STEEL CASTINGS CO.,

EVELINA STREET, - - PHILADELPHIA, PA.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc, etc

TUBBS & CO.,
